De Soto—1949-1950—Nos. E7L1-L2-L3-L4

WHEN SERVICING, USE GASKET ASSORTMENT No. 164A, REPAIR PACKAGE (E7L1-L2) No 1510A, (E7L3 L4) No 1528
PART NAMES IN CAPITAL LETTERS, LISTED BELOW, INDICATE CONTENTS OF REPAIR PACKAGE

Part No.	PART NAME	
1-629S	Body flange assembly (E7L1-L2)	
1 663S	Body flange assembly (Sup by 1-687S)	
1-687S	Body flange assembly (E7L3-L4)	
1A-24	Flange gasket—for use with governor	
1A-31	FLANGE GASKET—FOR USE WITHOUT GOVERNOR	
2 87	Throttle valve	
3-451S	Throttle shaft and arm asesmbly (E7L1-L2)	
3-671S	Throttle shaft and arm assembly (E7L3-L4)	
4-546S	Throttle lever assembly	
4A-101	Fast idle cam	
6-608S	Air horn assembly (E7L1)	
6-622S	Air horn assembly (E7L2-L3-L4)	
7-105S	Choke valve assembly	
11B 17	Pump discharge passage plug	
11B 35	Rivet plug	
11B-41	Rivet plug	
11B-79	Rivet plug	(3)
11B-108	IDLE PORT RIVET PLUG	
11B-138	PUMP JET RIVET PLUG	
11B-220	HIGH SPEED PASSAGE RIVET PLUG	
14-284S	Choke lever and shaft assembly	
14 352	Choke lever (loose)	
20-26	Main metering jet gasket	
20-31	Needle seat gasket	
20-51	Step-up jet gasket	
20-52	STEP UP PISTON GASKET	
20-81	SWITCH PLUNGER GASKET	
21-49S	Float and lever assembly	
24-23	Float lever pin	
25 82S	NEEDLE AND SEAT ASSEMBLY	
30A-37	Idle adjustment screw	
39-11	Valve attaching screw	(4)
48-145	PUMP JET (E7L1-L2)	
48-167	PUMP JET (E7L3-L4)	
49-158S	Valve plunger rod and plate assembly (E7L1-L2 L3)	
49-173S	Valve plunger rod and plate assembly (E7L4)	
61 84	Idle adjustment screw spring	
61-135	STEP UP PISTON SPRING	
61 145	PUMP SPRING	
61 157	Plunger spring	(2)
61-251	Switch piston spring	
61 254	Plunger operating spring	
61 336	Push rod sleeve spring (Sup by 61-403)	
61-372	Dash pot pick-up arm spring (E7L1-L2)	
61 393	Dash-pot pick up arm spring (E7L3-L4)	
61 403	Push rod sleeve spring	
63-24	FLOAT LEVER PIN RETAINER	
63 37	PUMP CYLINDER BALL RETAINER	
63 46	Spring retainer	
63 98	Switch piston locator (Use with 160-74S)	
63 136	Connector retainer clip (Use with 184-53S)	
64 60S	PLUNGER AND ROD ASSEMBLY (Identify by shaft No 49 120)	
64 77S	Dash-pot plunger and rod assembly	
76 77	Grounding wire	
86 15	Flange stud lock washer	(2)
86-40	Terminal lock washer (Use with 101-136)	
101-136	Terminal connector screw (Use with 184-26)	
101-145S	Body flange attaching screw and washer assy	(2)
101-150S	Air horn attaching screw and washer assy	(4)
101-159	Electro magnet assembly attaching screw	
101-164	Throttle lever clamp screw	
101-277S	Attaching screw and washer assembly	(4)
101-279	Throttle adjusting screw	
101-290	Terminal attaching screw	
105A-13	Flange nut	(2)
105A-28	Throttle lever clamp nut	
114-50	Dash-pot pick-up arm	
115-80	Fast idle rod	
115-98U	Push rod assembly and spring unit (Consists of 61-403 and 115-79S)	
116-13	PUMP INTAKE CHECK BALL	
116 18	PUMP DISCHARGE CHECK BALL	
117 60	PUMP LINK (E7L1-L2)	
117 70	PUMP LIFTER	
117-103	Dash pot lifter link	
117-104	Dash-pot connector link	
117 141	PUMP LINK (E7L3-L4)	
121-38	Body flange gasket (Sup by 121-160)	
121 89	Carbureter body to insulator gasket (Sup by 121-163)	
121-90	BODY GASKET	
121-160	BODY FLANGE GASKET	
121-163	BODY TO INSULATOR GASKET	
123-31S	IDLE ORIFICE TUBE AND PLUG ASSEMBLY	
136-71	Washer	
136-116	Terminal attaching screw washer	
145-13	MAIN VENT TUBE	
149-56S	STEP UP JET ASSEMBLY	
149-102S	Dash-pot valve cage assembly (E7L1-L2-L3)	
149-108S	Dash-pot valve cage assembly (E7L4)	
150-111	Dash-pot pin	
150A-13	PIN SPRING	(2)
160-46S	STEP-UP PISTON, PLATE AND ROD ASSEMBLY	
160-74S	Kick down switch piston assembly (Sup by 160-88S)	
160-88S	Kick-down switch piston assembly	
161 45	Terminal end plate	
161-46	Push rod end plate	
172-16	Cable clip	
183-30	Insulator (Sup by 183-66)	
183 66	Insulator	
184-26	Terminal block (E7L1-L2) (Sup by 184 53S, 101-290 and 136 116)	
184 52	Terminal block (Sup by 184-53S)	
184 53S	Terminal block and clip assembly	
195-42U	Unitized package (E7L1-L2) (Sup by 195-47U)	
195 47U	Unitized package (For kick-down switch)	
213 11S	Electro magnet and housing assembly	
224 13S	MAIN METERING JET ASSEMBLY	
224-14S	Main metering jet assembly—1 size lean	
224 15S	Main metering jet assembly—2 sizes lean	

NOTE Figures in parentheses indicate number of pieces used in one carbureter Where no figure is shown only one is used

These Carbureters also used on Chrysler "C38", "C45", "C48" Cars equipped with Standard Transmission

1946-1950

B-B Down-Draft Carbureters—**Models EX1-EX2-EX3-EX1R-EX2R-EX3R**

CARBURETER SPECIFICATIONS

For De Soto Six Cylinder Engine: 3-7/16 Inch Bore, 4¼ Inch Stroke

Dimensions: Flange size, 1½ inch (38.1 mm).
Throttle bore, 1-11/16 inch (42.86 mm).
Main venturi, 1-11/32 inch (34.13 mm) I. D.

Float Setting: Top of float 5/64 inch (1.98 mm) below top surface of carbureter body casting. Plus or minus 1/64 inch (.397 mm).

Vents: Outside, none. Inside, balance vent tube .218 inch diameter (5.54 mm).

Gasoline Intake Needle: Triangular, horizontal No. 44 (2.18 mm) drill in needle seat.

Idle Orifice Tube: Jet size .0276 inch (.70 mm) drill. Idle passage air bleed, in body, size .063 inch (1.60 mm) diameter (EX1-EX2-EX1R-EX2R). Idle passage air bleed, in air horn, size .0465 inch (1.18 mm) diameter (EX3-EX3R). Restriction in body, size .053 inch (1.35 mm) diameter (EX1-EX2-EX1R-EX2R), size .0452 inch (1.15 mm) diameter (EX3-EX3R).

Idle Ports: Upper port. Keyhole type: length, .128 inch (3.25 mm); width .027 inch (.69 mm). .063 inch (1.60 mm) diameter hole at top (EX1-EX2-EX1R-EX2R). Slot type: length .149 inch (3.78 mm); width .030 inch (.76 mm) (EX3-EX3R). Top of port located .088 to .092 inch (2.24 to 2.34 mm) (EX1-EX2-EX1R-EX2R), and .118 to .122 inch (3.00 to 3.10 mm) (EX3-EX3R) above top edge of valve. Lower port size .053 to .057 inch (1.35 to 1.45 mm) drill. (For idle adjustment screw.)

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture, turn screw out. Idle engine between 450 and 500 r.p.m.

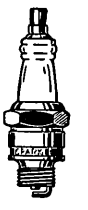
Main Metering Screw: Calibrated to flow 312 to 316 cc per minute (EX1-EX2-EX1R-EX2R); 315 to 319 cc per minute (EX3-EX3R). (Do not gauge for size. If in doubt replace with new part.)

Main Vent: Through diffuser (air bleed inside bowl). Size .0315 inch (.80 mm) drill.

Main Vent Tube: Side holes, 4—.0354 inch diameter.

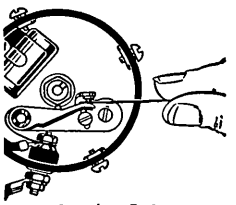
Step-Up Jet: Power orifice .0413 inch (1.05 mm) drill.

Accelerating Pump: Type—delayed action, seasonal adjustment. Stroke—Summer setting (inner hole, short stroke). Intermediate setting (center hole). Winter setting (outer hole, long stroke). Pump intake passage ball check seat, size .107 to .112 inch (2.72 to 2.85 mm) diameter in body. Pump discharge passage: Restriction (under ball check) size .062 to .065 inch (1.57 to 1.65 mm) diameter in body. Pump (discharge) jet size, .0374 inch (.95 mm) drill 48-75 (EX1-EX1R); .0334 inch (.85 mm) drill 48-145 (EX2-EX2R); .0413 (1.05 mm) drill 48-167 (EX3-EX3R).



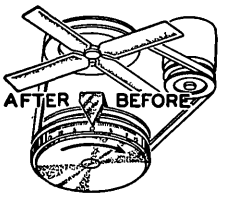
Pump Adjustment: 26/64 inch plunger travel (early production), 20/64 inch plunger travel (late production)—full throttle position, medium stroke. Use gauge T109-117S (EX1-EX2-EX1R-EX2R). Pump adjustment (EX3-EX3R): None.

Choke: Offset butterfly type (with poppet valve) interconnected to open throttle valve to fast idle position when choke is used.

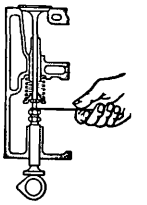


Vacuum Spark Port: Slot (round end) type; size .040 by .110 inch (1.016 by 2.794 mm). Top of port .052 to .058 inch (1.32 to 1.47 mm) above top edge of valve.

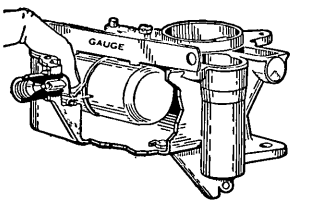
Motor Tune-Up—Be Accurate!



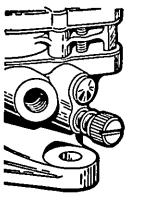
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .030"



Breaker Point Setting .017"-.019"



Ignition Timing Breaker Points to Open 2° B. T. D. C.

Valve Setting (Hot) Intake .008" Exhaust .010"

Float Setting (Use Gauge) 5/64 Inch

Idle Adjustment Screw Setting ½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service, check float level. Wear on lip of float lever will raise float level. Before adjusting float, be sure float lever pin is firmly seated. Reset float level by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level. Bend vertical lip of float only.

If motor stalls while idling, set throttle lever adjusting screw so motor runs approximately 300 r. p. m. Then set idle adjustment screw to specifications. If these adjustments do not correct the trouble, remove idle orifice tube and plug assembly. Clean tube and passages with compressed air.

If acceleration is not satisfactory remove pump jet and clean with compressed air. However, it is usually advisable to replace the pump jet, as its cost is nominal. All jets must be seated gasoline tight. Poor acceleration may be due to damaged or worn plunger leather in accelerating pump, sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage. If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather.

CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.

Correct air fuel ratio is provided by a "balance tube" in the air horn The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner Should the cleaner become clogged, the capacity will be reduced but the air-fuel mixture ratio will not be changed

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with tool No T109-43, main vent tube can be removed and a new tube inserted with tool No T109-195 Care must be exercised in inserting new tube which must seat tightly Use new rivet to complete the installation

Pump Adjustment: Remove air horn assembly, back out throttle lever adjustment screw and install pump operating link in center hole of throttle shaft arm Place pump travel gauge T109-117S on upper surface of body casting with lip of gauge extending over top of plunger shaft Turn knurled nut of gauge until lip rests on top of plunger shaft Difference in readings obtained at closed and wide open throttle should be "26" (early production), "20" (late production) Adjustment can be made by bending horizontal portion of pump lifter link

B-B DOWN-DRAFT CARBURETERS—**MODELS EV1-EV2**

CARBURETER SPECIFICATIONS

For De Soto Six Cylinder Engine 3 7/16 Inch Bore 4¼ Inch Stroke

Dimensions Flange size 1½ inch (38 1 mm)
Throttle bore 1 11/16 inch (42 86 mm)
Main venturi 1 11/32 inch (34 13 mm) I D

Float Setting Top of float 5/64 inch (1 98 mm) below top surface of carbureter body casting Plus or minus 1/64 inch (397 mm)

Vent Outside none Inside balance vent 218 inch diameter (5 54 mm)

Gasoline Intake Needle Triangular horizontal No 44 (2 18 mm) drill in needle seat

Idle Orifice Tube Jet size 0276 inch (70 mm) drill Idle passage air bleed in body size 063 inch (1 60 mm) diameter Restriction in body size 053 inch (1 35 mm) diameter

Idle Ports Upper port Keyhole type length 128 inch (3 25 mm) width 027 inch (69 mm) 063 inch (1 60 mm) diameter hole at top Top of port 088 to 092 inch (2 24 to 2 34 mm) above top edge of valve (early production) 093 to 097 inch (2 36 to 2 46 mm) above top edge of valve (late production)
Lower port size 053 to 057 inch (1 35 to 1 45 mm) drill (For idle adjustment screw)

Set Idle Adjustment Screw ¾ to 1¼ turns open For richer mixture turn screw out Do not idle engine below 300 r p m or 6 miles per hour

Main Metering Screw Calibrated to flow 3 12 to 316 cc per minute (Do not gauge for size If in doubt replace with new part)

Main Vent Through diffuser (air bleed inside bowl) Size 0315 inch (80 mm) drill

Main Vent Tube Side Holes 4—0354 inch diameter

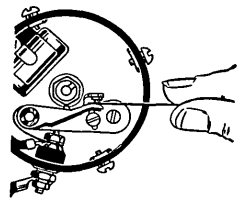
Step up Jet Power orifice 0413 inch (1 05 mm) drill

Accelerating Pump Type—delayed action
Stroke—Summer setting (inner hole short stroke)
Intermediate setting (center hole)
Winter Setting (outer hole long stroke)
Pump intake passage size 115 to 120 inch (2 93 to 3 05 mm) diameter in body
Pump discharge passage Restriction (under ball check) size 062 to 065 inch (1 57 to 1 65 mm) diameter in body
Pump (discharge) jet size 0374 inch (95 mm) drill

Pump Adjustment 26/64 inch plunger travel (EV1) 20/64 inch plunger travel (EV2) full throttle position medium stroke (Use gauge T109 117S)

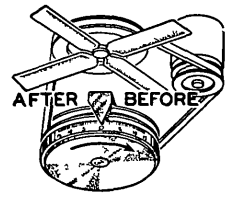
Choke Offset butterfly type (with poppet valve) inter connected to open throttle valve to fast idle position when choke is used

Slow Closing Throttle Dash pot with discharge (By pass) size 0197 (5 mm) drill through valve cage

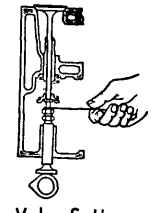


Vacuum Spark Port Slot (round end) type size 040 by 110 inch (1 016 by 2 794 mm) Top of port 052 to 058 inch (1 32 to 1 47 mm) above top edge of valve

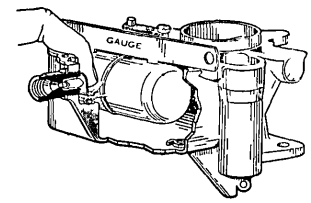
Motor Tune-Up—Be Accurate! Always Use Feeler Gauges!



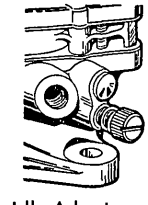
CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter



Spark Plug Gap 030"



Breaker Point Setting 017" to 019"



Ignition Timing Breaker Points to Open 2° B T D C

Valve Setting (Hot) Intake 008" Exhaust 010"

Float Setting (Use Gauge) 1/16 Inch

Idle Adjustment Screw Setting ¾ to 1¼ Turns Open

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service check float level Wear on lip of float lever will raise float level Before adjusting float be sure float lever pin is firmly seated Reset float level by bending lip of float lever away from needle to raise level or bend lip toward needle to lower float level Bend vertical lip of float only

If motor stalls while idling set throttle lever adjusting screw so motor runs approximately 300 r p m then set idle adjustment screw to specifications If these adjustments do not correct the trouble remove idle orifice tube and plug assembly Clean tube and passages with compressed air

If acceleration is not satisfactory remove pump jet and clean with compressed air However it is usually advisable to replace the pump jet as its cost is nominal All jets must be seated gasoline tight Poor acceleration may be due to damaged or worn plunger leather in accelerating pump, sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather

61-403	Push rod sleeve spring
63-24	FLOAT PIN RETAINER
63-37	PUMP CYLINDER BALL RETAINER
63 46	Pump spring retainer
63-98	Piston locator (Use with 160-74S)
64-60S	PUMP PLUNGER AND ROD ASSEMBLY (Identify by shaft No 49-120)
64-77S	Dash-pot plunger and rod assembly (Identify by shaft No 49-132)
86-15	Flange stud lock washer
86-16	Lock washer (switch) (4)
86-40	Lock washer (Use with 101-136)
101-56	Plate attaching screw (switch) (4)
101-136	Terminal connector screw (Use with 184-26)
101-145S	Body flange attaching screw and washer assembly (2)
101-146S	Air horn attaching screw and washer assembly (Sup by 101-150S)
101-150S	Air horn attaching screw and washer assembly (4)
101-159	Electro magnet assembly attaching screw
101-163	Throttle lever adjusting screw (Sup by 101-279)
101-164	Throttle lever clamp screw
101-279	Throttle adjusting screw
101-290	Terminal attaching screw
105A-13	Flange nut
105A-28	Throttle lever clamp nut
114-50	Dash pot pick-up arm
115-80	Fast idle rod
115-98U	Push rod assembly and spring unit (Consists of 61-403 and 115-79S, the entire step-down switch plunger assembly and spring)
116-13	PUMP INTAKE CHECK BALL
116-18	PUMP DISCHARGE BALL
117-60	PUMP LINK
117-62	Pump link (Sup by 117-60)
117-70	PUMP LIFTER LINK
117-103	Dash-pot lifter link
117-104	Dash-pot connector link
121-38	FLANGE TO INSULATOR GASKET
121-89	CARBURETER BODY TO INSULATOR GASKET
121-90	BODY GASKET
123-31S	IDLE ORIFICE TUBE AND PLUG ASSEMBLY
136-71	Switch plunger washer
136-116	Terminal attaching screw washer
145-13	MAIN VENT TUBE
149-56S	STEP-UP JET ASSEMBLY
149-73S	Dash pot valve cage assembly (Sup by 149-102S)
149-102S	Dash pot valve cage assembly
150-111	Dash-pot pin
150A-13	PIN SPRING (2)
159-63S	Main metering jet assembly—2 sizes lean
159-87S	Main metering jet assembly—1 size lean
159-89S	MAIN METERING JET ASSEMBLY
160-46S	STEP-UP PISTON, PLATE AND ROD ASSEMBLY
160-74S	Switch piston assembly (Sup by 160-88S)
160-88S	Kick-down switch piston assembly
161-45	Switch terminal end plate
161-46	Switch push rod end plate
172-16	Cable clip
183 30	Insulator
184 26	Switch terminal block (Sup by 184-53S 101-290 and 136-116)
184-52	Terminal block (Sup by 184-53S)
184-53S	Terminal block and clip assembly
195-42U	Unitized package (Sup by 195-47U)
195-47U	Unitized package (for kick-down switch)
213-12S	Electro magnet and housing assembly

DESOTO TAXI MODEL "S11" 1946-47

(EX3R can also be used)

B-B DOWN-DRAFT CARBURETER—**MODEL EL1**

CARBURETER SPECIFICATIONS

For De Soto Six Cylinder Engine 3 7/16 Inch Bore, 4 1/4 Inch Stroke

Dimensions Flange size 1 1/2 inch (38 1 mm)
Throttle bore 1 11/16 inch (42 86 mm)
Main venturi 1 11/32 inch (34 13 mm) I D

Float Setting Top of float 5/64 inch (1 98 mm) below top surface of carbureter body casting (Plus or minus 1/64 inch (397 mm)

Vents Outside none Inside balance vent 218 inch diameter (5 54 mm)

Gasoline Intake Needle Triangular horizontal No 44 (2 18 mm) drill in needle seat

Idle Orifice Tube Jet size 0276 nch (70 mm) drill
Idle passage air bleed (in body) size 063 inch (1 60 mm) diameter
Restriction in body—size 053 inch (1 35 mm) diameter

Idle Ports Upper port Keyhole type length 128 inch (3 25 mm) width 027 inch (69 mm) 063 inch (1 60 mm) d am eter hole at top
Top of port located 088 to 092 (2 24 to 2 34 mm) above top edge of valve
Lower port size 053 to 057 inch (1 35 to 1 45 mm) drill (For idle adjustment screw)

Set Idle Adjustment Screw 1/2 to 1 1/2 turns open For r cher mixture turn screw out Do not idle engine below 300 r p m or 6 miles per hour

Main Metering Screw Calibrated to flow 312 to 316 cc per minute (Do not gauge for size If in doubt replace with new part)

Main Vent Through diffuser (air bleed inside bowl) size 0315 inch (80 mm) drill

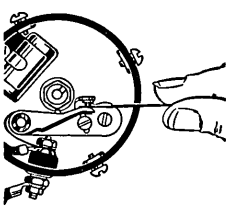
Main Vent Tube
Side holes 4—0354 inch diameter

Step up Jet Size 0413 inch (1 05 mm) drill

Accelerating Pump Type delayed action Stroke Summer setting (inner hole short stroke)
Intermediate setting (center hole)
Winter setting (outer hole long stroke)
Pump intake passage size 115 to 120 inch (2 93 to 3 05 mm) diameter in body Pump discharge passage restriction (under ball check) size 062 to 065 inch (1 57 to 1 65 mm) diameter in body Pump (discharge) jet size 0374 inch (95 mm) drill

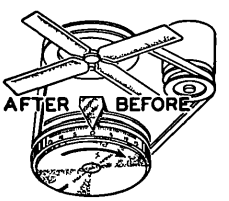
Pump Adjustment 26/64 inch plunger travel full throttle pos tion medium stroke Use gauge T109 117S

Choke Offset butterfly type (with poppet valve) inter con nected to open throttle valve to fast idle position when choke is used

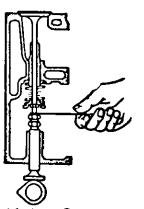


Vacuum Spark Port Slot (round end) type Size 040 by 110 inch (1 016 by 2 794 mm) Top of port 052 to 058 inch (1 32 to 1 47 mm) above top edge of valve

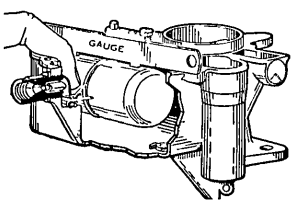
Motor Tune-Up—Be Accurate!



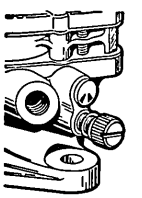
CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter



Spark Plug Gap 030"



Breaker Point Setting 017"-019"



Ignition Timing Breaker Points to Open 2° B T D C

Valve Setting (Hot) Intake 008" Exhaust 010"

Float Setting (Use Gauge) 5/64 Inch

Idle Adjustment Screw Setting 1/2 to 1 1/2 Turns Open

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service check float level Wear on lip of float lever will raise float level Before adjusting float be sure float lever pin is firmly seated Reset float level by bending lip of float lever away from needle to raise level or bend lip toward needle to lower float level Bend vertical lip of float only

If motor stalls while idling set throttle lever adjusting screw so motor runs approximately 300 r p m Then set idle adjustment screw to specifications If these adjustments do not correct the trouble remove idle orifice tube and plug assembly Clean tube and passages with compressed air

If acceleration is not satisfactory remove pump jet and clean with compressed air However it is usually advisable to replace the pump jet as its cost is nominal All jets must be seated gasoline tight Poor acceleration may be due to damaged or worn plunger leather in accelerating pump sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in dis charge passage If plunger is removed from cylinder use care in installing to avoid damage to plunger leather

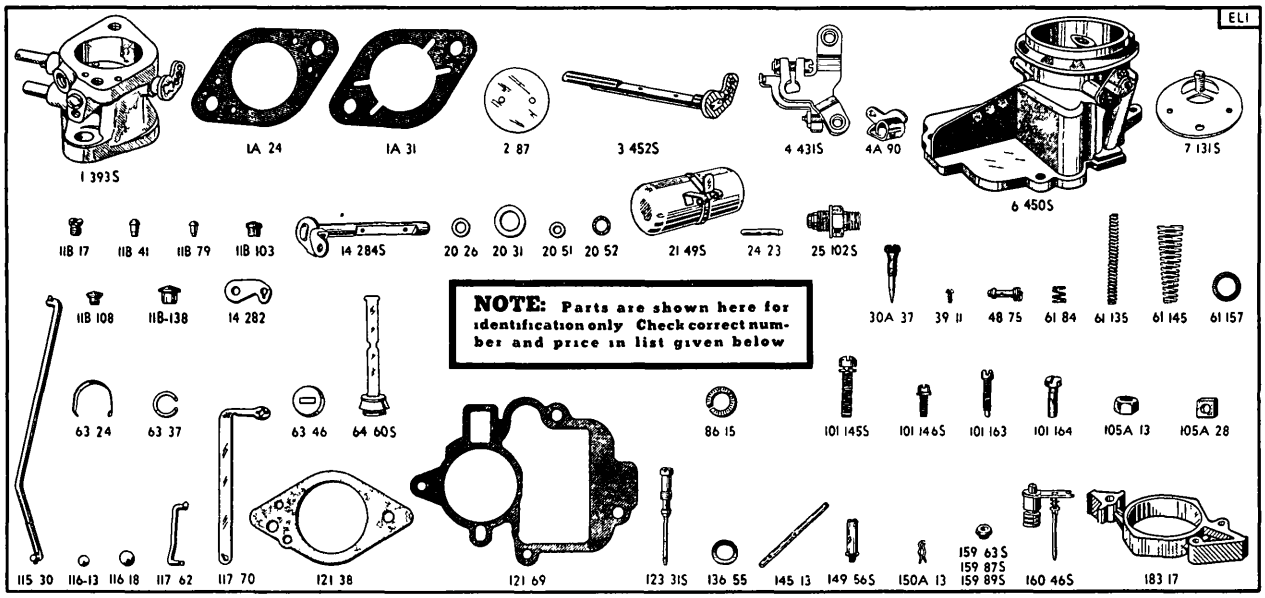
CARBURETER
TRADE MARK REG U S PAT OFF
MARCA REGISTRADA



PRINTED IN U S A

Correct air fuel ratio is provided by a balance tube in the air horn The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type size or condition of air cleaner Should the cleaner become clogged the capacity will be reduced but the air fuel mixture ratio will not be changed

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with tool No T109 43 main vent tube can be removed and a new tube inserted with tool No T109-195 Care must be exercised in inserting new tube which must seat tightly Use new rivet to complete the installation

Pump Adjustment Remove air horn assembly back out throttle adjustment screw and place pump operating link in center hole of throttle shaft arm Place gauge T109-117S on edge of bowl cover so that lip of gauge extends over top of plunger shaft Turn knurled nut of gauge until lip contacts plunger shaft Difference in readings obtained at closed and wide open throttle positions should be 26 (26/64' plunger travel) Adjustment can be made by bending horizontal portion of pump lifter link

Pump stroke adjustable for high or low temperature Set to long stroke for cold weather short stroke for hot weather or high altitude driving

De Soto "S11"—1946-47—No. EL1

WHEN SERVICING, USE REPAIR PACKAGE No 1311C

AFB Four-Bore Down-Draft Climatic® Control **Carbureters Nos. 2790S 2791S**

CARBURETER SPECIFICATIONS

For Dodge 8 Cylinder 383 Cu. In. Engine: Vacuum at Idle 19.5 Inches

Dimensions: Flange, four bore – 4 bolt type.
Throttle Bore, primary, 1-7/16 inch.
Secondary 1-9/16 inch I.D.
Primary venturi size, primary side, 7/16 inch, secondary side, 11/32 inch I.D.
Main venturi size, primary side 1-1/16 inch, secondary side, 1-1/4 inch I.D.

Vents: Inside (4) in air horn. Outside (5) in air horn.

Low Speed Circuit: (Primary side only)
Jet, size No. 68 (.031 inch) drill.
By-pass, size (.0492 inch) diameter.
Economizer, size No. 57 (.043 inch) drill.
Idle bleed, size No. 55 (.052 inch) drill.
Idle port, slot type, length .166 inch; width .030 inch.

Idle Port Opening: : (2790S) .094 to .100 inch; (2791S) .085 to .091 inch above top edge of valve with valve tightly closed.

Set Idle Adjustment Screw: 1/2 to 2 turns open. For richer mixture turn screw out. Do not idle engine below 650 R.P.M.
Transmission in neutral.

Main Nozzle. Installed permanently. DO NOT REMOVE.
Anti-percolator bleed, primary, (tube in venturi assembly) size No. 70 (.028 inch) drill.
Secondary, drilled hole in venturi assembly size No. 60 (.040 inch) drill.

Main Vent Tube: (In venturi assembly, primary side only). Side holes 11 – size No. 70 (.028 inch) drill, 1 – size No. 65 (.035 inch) drill.

Secondary Initial Discharge: (In venturi assembly). Pick up tube size No. 60 (.040 inch) drill. Air bleed size (.0275 inch) diameter. Discharge port size No. 53 (.0595 inch) drill.

Accelerating Pump: Discharge jet (twin) primary side only, size No. 68 (.031 inch) drill. Intake ball check seat (screw plug), size .115 to .120 inch diameter. Discharge needle seat size No. 50 (.070 inch) drill.

Choke: (2791S) Carter Climatic® Control set 1 point rich. Butterfly type – offset choke valve, primary side only. Choke heat suction hole, bushing between body and piston housing, size No. 48 (.076 inch) drill.

Vacuum Spark Port: (2791S) Round type, .060 inch diameter. Top of port .012 to .018 inch above upper edge of valve with valve tightly closed.

Motor Tune-Up – Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .017"	Ignition Timing Breaker Points to Open: 10° B. T. C. At Vibration Damper	Float Setting (2790S) 9/32" (Use Gauge T109-126) (2791S) 7/32" (Use Gauge T109-106)	Idle Adjustment Screw Setting 1/2 to 2 Turns Open 650 R. P. M.

NOTE: These cars are equipped with Hydraulic Valve Lifters – NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

FLOAT ALIGNMENT: Side of floats parallel to edg of casting. Minimum clearance between lever and air horn lugs without binding. To adjust, bend float lever.

FLOAT LEVEL: (2790S) 9/32 inch (gauge T109-126). (2791S) 7/32 inch (gauge T109-106) between top of floats (at outer end) and air horn gasket. To adjust, bend float lever.

FLOAT DROP: 23/32 inch between top of floats (at out r end) and air horn gasket. To adjust, b nd stop tabs on float bracket.

PUMP: 7/16 inch from the top of the bowl cover to th top of the plunger shaft with throttle connector rod in center hole (medium stroke) of pump arm. To adjust, band throttle connector rod.

CHOKE PISTON LEVER ADJUSTMENT: (2791S only). 1/8 inch (gauge T109-36) between choke lever and stop in piston housing with choke valve closed. To adjust, bend choke connector rod.

FAST IDLE LINKAGE ADJUSTMENT: (2791S only). With choke valve tightly closed and lug on out r choke shaft lever contacting stop on inner chok shaft lever align center of fast idl screw with index mark on cam. To adjust, bend fast idle connector rod.

FAST IDLE THROTTLE VALVE CLEARANCE! (2791S only) .012 inch (gauge T109-200) between lower edge of valve and bore with adjusting screw on index mark of cam.

FAST IDLE ON CAR: (2791S only) 1400 R.P.M. hot engine with fast idle screw on index mark of cam.

UNLOADER: (2791S only) 1/4 inch (gauge T109-31) betw en upper edge of choke valve and inner wall of air horn. To adjust, bend unloader lip on throttle lever.

SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Block choke valve wide open. 2. With 23/64 inch between lower edge of primary valve and bore (opposite idle port) sec ondary valves should just start to open. To adjust, bend throttle operating rod. NOTE: At wide open throttle primary and secondary valves will reach full vertical position. 3. With primary and secondary valves in tightly closed position there should be . .010" to .030" (gauge T109-29) between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever.

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: (2791S only) 1. Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock out dog. To adjust, bend tang on secondary throttle lever. 2. With lock-out dog held tight against stop on flange casting and secondary throttle valves partially open there should be a .020 inch (gauge T109-29) between tang on secondary throttle lever and lock-out arm. To adjust, bend arm at slot on lock-out dog. NOTE: Fast idle cam may be removed to facilitate gauging and adjusting.

IDLE SPEED AND MIXTURE ADJUSTMENT (Normal Engine Temp): In making the idle adjustment on the engine, the air adjustment screw is used to adjust idle speed in a similar manner as the throttle speed screw used previously. Turning the air adjustment screw outward increases engine speeds, but also leans the mixture supplied to the manifold which must be compensated for by adjustment of the idle mixture adjusting screws.

TOOLS REQUIRED FOR SERVICING CARBURETERS:

160-153	Step-up piston	(2)
170-577S	Piston housing and plug assembly (2791S)	
170AZ-538S	Thermostatic coil and housing assembly (2791S)	
172-22	Throttle connector rod retainer	
181-254	Fast idle cam (2791S)	
184-85	Choke heat tube cap (2791S)	
186-65	Choke baffle plate (2791S)	
186-70	Fuel bowl baffle	(2)

–Parts so marked are new and listed for the first time.

NOTE: Figures in parentheses indicate number of pieces used in one carbureter. Where no figure is shown, only one is used.

DODGE

MODEL MD2, D500

1959

(POLICE SPECIAL)

AFB Four-Bore Down-Draft Climatic® Control Carbureter No. 2854S

CARBURETER SPECIFICATIONS

For Dodge 8 Cylinder 383 Cu. In Engine: Vacuum at Idle 19.5 Inches

Dimensions: Flange four bore—4 bolt type
Throttle bore primary 1 7/16 inch secondary 1-9/16 inch
Primary venturi size primary side 7/16 inch secondary side 11/32 inch I D
Main venturi, primary, 1 3/16 inch secondary, 1 5/16 inch

Vents: Inside (4) in air horn Outside (5) in air horn

Low Speed Circuit: (Primary side only)
Jet size No 66 (.033 inch) drill
By pass size (.0492 inch) diameter
Economizer size (.0452 inch) diameter
Idle bleed size (.0492 inch) diameter
Idle port slot type length .198 inch width .030 inch

Idle Port Opening: .142 to .148 inch above top edge of valve with valve tightly closed

Set Idle Adjustment Screw: 1/2 to 2 turns open For richer mixture turn screw out Do not idle engine below 500 R P M Transmission in neutral

Main Nozzle: Install permanently DO NOT REMOVE Antipercolator bleed, primary (tube in venturi assembly), size No 68 (.031 inch) drill Secondary (drilled hole in venturi assembly) size No 60 (.040 inch) drill

Main Vent Tube: (In venturi assembly) Side holes primary side 1—size No 70 (.028 inch) 1—size No 65 (.035 inch) drill, secondary side 2—size No 57 (.043 inch) 1—size No 70 (.028 inch) drill

Accelerating Pump. Discharge jet (twin) primary side only size No 68 (.031 inch) drill Intake ball check seat (screw plug) size .115 to .120 inch diameter Discharge needle seat size No 50 (.070 inch) drill

Choke: Carter Climatic® Control Cross Over type set on index Butterfly type offset valve primary side only Choke heat suction hole in air horn size No 44 (.086 inch) drill

Vacuum Spark Port: Slot type (round end) .045 x .110 inch Top of port .026 to .034 inch above top edge of valve with valve tightly closed

Motor Tune-Up — Be Accurate!

CAUTION Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap	Breaker Point Setting	Ignition Timing Breaker Points to Open	Float Setting	Idle Adjustment Screw Setting
.035"	.017"	10° B. T. C. At Vibration Damper	(See Adjustments)	1/2 to 2 Turns Open 500 R. P. M. In Neutral

NOTE These cars are equipped with Hydraulic Valve Lifters — NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3735

FLOAT ALIGNMENT: Side of floats parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding. To adjust, bend float lever.

FLOAT LEVEL: 7/32 inch (gauge T109-106) plus or minus 1/64 inch, between top of floats (at outer end) and air horn gasket. To adjust, bend float lever.

FLOAT DROP: 23/32 inch plus or minus 1/16 inch between top of floats (at outer end) and air horn gasket. To adjust, bend stop tabs on float brackets.

PUMP: 7/16 inch from the top of the bowl cover to the top of the plunger shaft with throttle connector rod in center hole (medium stroke) of pump arm. To adjust, bend throttle connector rod.

FAST IDLE LINKAGE ADJUSTMENT: With choke valve tightly closed and lug on outer choke shaft lever contacting stop on inner choke shaft lever align center of fast idle screw with index mark on cam. To adjust, bend fast idle connector rod.

FAST IDLE THROTTLE VALVE CLEARANCE: .015 inch (gauge T109-44) between lower edge of valve and bore with adjusting screw on index mark of cam.

FAST IDLE ON CAR: 1400 R. P. M. hot engine with fast idle screw on index mark of cam.

UNLOADER: 1/4 inch (gauge T109-31) between upper edge of choke valve and inner wall of air horn. To adjust, bend unloader lip on throttle lever.

SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Block choke valve wide open. 2. With 3/8 inch between lower edge of primary valve and bore (opposite idle port) secondary valves should just start to open. To adjust, bend throttle operating rod. NOTE: At wide open throttle primary and secondary valves will reach full vertical position. 3. With primary and secondary throttle valves in tightly closed position there should be .010" to .030" (gauge T109-29) between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever.

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. To adjust, bend tang on secondary throttle lever.

CHOKE ADJUSTMENT (CROSS OVER TYPE) SEE FORM 3661: 1. Loosen mounting post lock nut and turn mounting post with screw driver until index mark on disk is positioned as listed on carbureter specification page. Hold in this position with screw driver and tighten lock nut. NOTE: Screw driver may be held in vise so that one hand may be used to support housing while tightening nut. 2. After adjustment is completed and coil housing and rod assembly and carbureter is installed on engine lift cover disk and open and close choke valve manually to see if connector rod clears sides of hole in housing cover. If rod does not clear hole in housing cover without binding replace with a new unit since connector rod cannot be bent without affecting calibration.

CARTER MODEL BBD CARBURETER FOR DODGE (SERVICE ADJUSTMENT PROCEDURE)

NOTE: The parts and specification pages referred to are catalog pages. These pages can be obtained from Carter Carburetor, Catalog Department, St. Louis (7), Missouri. Specify the carbureter number found on the brass identification tag, when requesting specification pages.

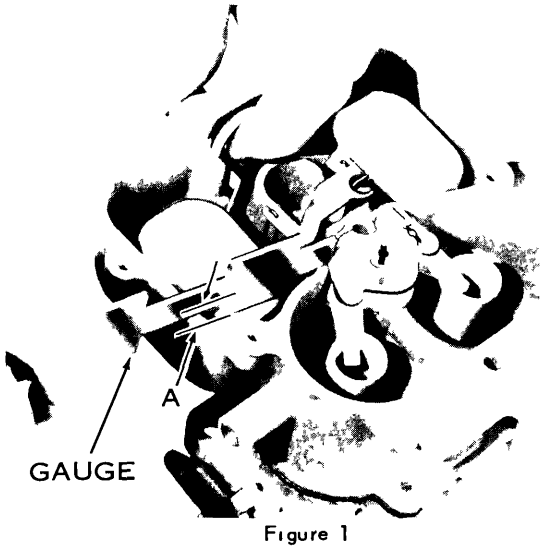

Figure 1

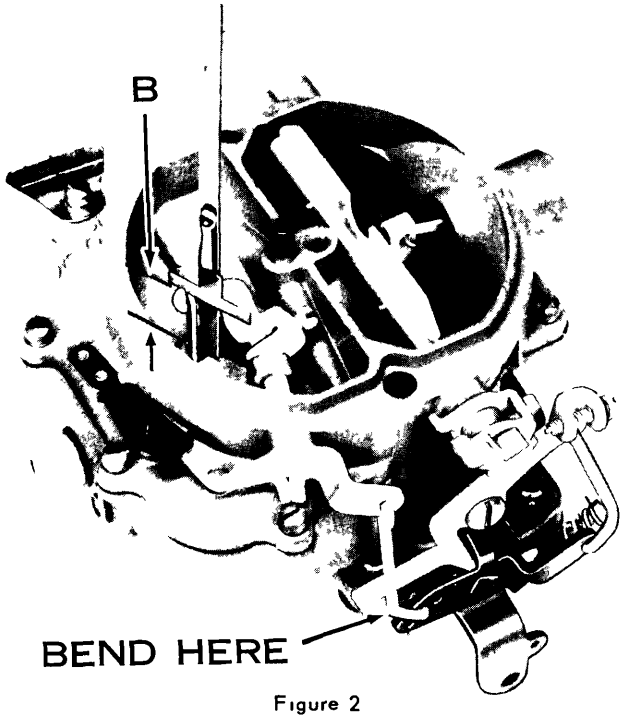

Figure 2

PUMP ADJUSTMENT (Fig. 2):

1. Back out throttle adjustment screw and open choke valve so that throttle valves seat in bores of carbureter.
2. Install throttle connector rod in the hole in the throttle lever specified on carbureter specification page.
3. The distance (B) from the top of the bowl cover to the top of the plunger shaft should be as specified on carbureter specification page.
4. Adjust by bending pump connector rod. (Use bending tool T109-213)

FLOAT ADJUSTMENT (Fig. 1):

This adjustment must be made with the bowl cover gasket removed. Hold the lip on float arm against the seated intake needle, making sure the float pin is at the bottom of its guide slots. The distance (A) from the top surface of the body casting to the top of each float (at free end) should be as listed on carburetter specification page. If one float is lower than the other, equalize by bending the float arm. If both floats require the same correction, adjust by bending lip on float arm. The floats must not rub anywhere against the inner walls of the bowl. If necessary, bend float arms slightly to provide clearance on all sides of floats.

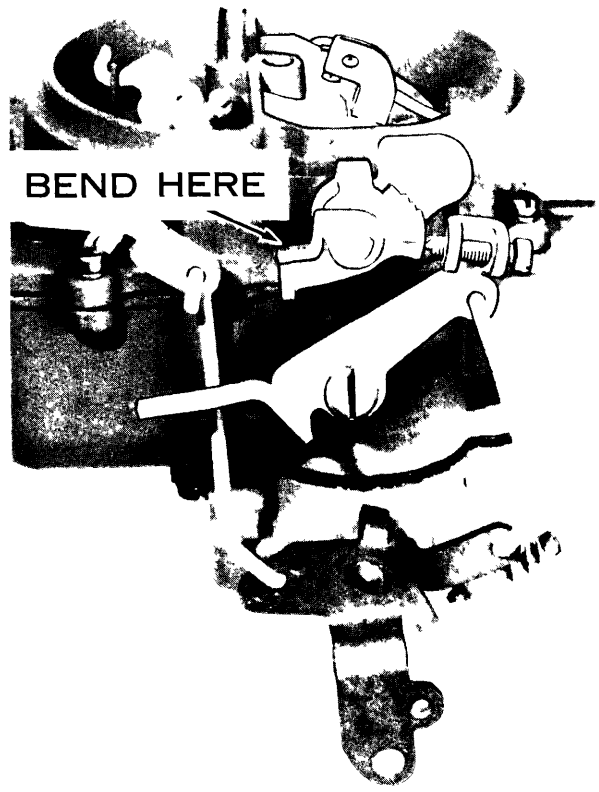

Figure 3

FAST IDLE LINKAGE ADJUSTMENT (Fig. 3):

With choke valve tightly closed and lug on fast idle cam contacting lip on choke shaft lever align center of fast idle screw with index mark on cam. To adjust bend lip on choke shaft lever (use tool T109-22).

TRADE MARK REG U S PAT. OFF.
MARCA REGISTRADA

S S PRINTED IN U.S.A.

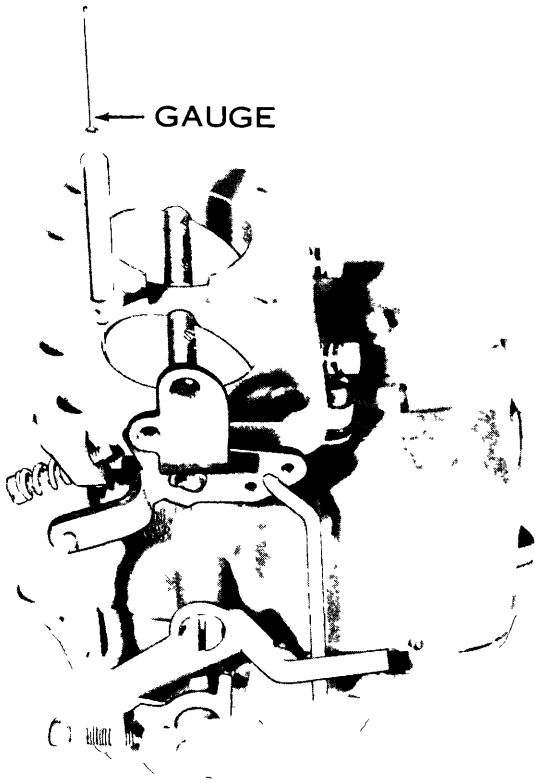

Figure 4

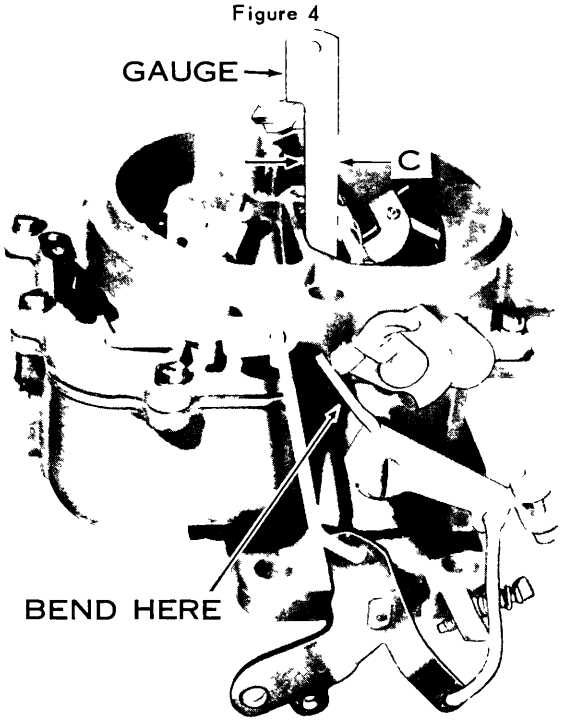

Figure 5

UNLOADER ADJUSTMENT (Fig. 5):

1. Hold throttle valves wide open.
2. Close choke valve as far as possible without forcing.
3. Clearance (C) between top edge of choke valve and inn r wall of air horn sh uld be as listed on carbureter specification page.
4. Adjust by bending unl ad r fing r on fast idle arm. (Use tool T109-22).

FAST IDLE THROTTLE VALVE CLEARANCE ADJUSTMENT (Fig. 4):

1. Be sure choke valve is closed.
2. Adjust fast idle adjusting screw against index mark of cam (revolve cam if necessary) until the clearance between throttle valve (side opposite port) and bore is as listed on carbureter specification page.

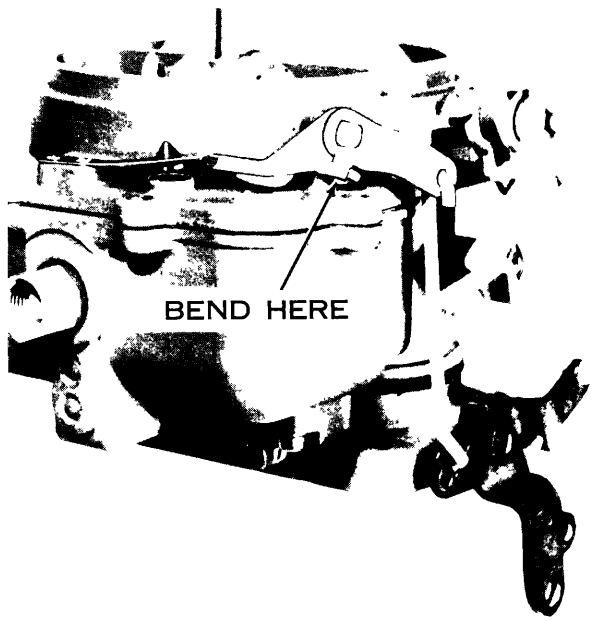

Figure 6

BOWL VAPOR VENT ADJUSTMENT (Fig. 6):

With throttle valve tightly closed the clearance between the heel of the rubber grommet and its seat on the bowl cover should be as listed on carbureter specification page. To adjust, bend lip on vapor vent arm (Use tool T109-22)

CAUTION:

When servicing carbureter use elevating legs (T109-289U) to prevent damaging throttle valves.

(Also used on Canadian Dodge, Model MD3)

BBD Dual Down-Draft Climatic® Control Carbureter No. 2870S

CARBURETER SPECIFICATIONS

For Dodge 8 Cylinder 360 Cu. In. Engine: Vacuum at Idle 19.5 Inches

Dimensions: Flange dual, 4 bolt type Throttle bore, 1-9/16 inch I D Primary venturi, 15/32 inch I D Main venturi 1-5/16 inch I D

Vent: Inside in air horn Outside, none

Low Speed Circuit: Jet, in venturi assembly, size (0295 inch) diameter Idle bleed, in venturi cluster screw, size (059 inch) diameter Idle restriction in venturi cluster screw, size (051 inch) diameter Venturi idle bleed in body size (040 inch) diameter Idle port slot type, length 198 inch width 030 inch

Idle Port Opening: 140 to 144 inch above upper edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw): Size 055 inch diameter

Set Idle Adjustment Screw: 1/4 to 1 1/4 turns open For richer mixture turn screw out With gear shift in neutral position, idle engine at 500 R P M

Main Nozzle: Nozzle is installed permanently DO NOT REMOVE

Main Vent Tube: Side holes 2—size 0292 inch, 1—size 038 inch diameter

Accelerating Pump: Pump discharge jets (2—in venturi cluster), size 0275 inch diameter Intake ball check seat, size 130 to 140 inch diameter Discharge ball check seat, size 110 to 120 inch diameter

Choke: Carter Climatic® cross over type, set at index Butterfly type offset valve Choke heat suction hole in air horn size (0905 inch) diameter

Vacuum Spark Port: Horizontal round end type 030 by 090 inch Top of port to be 015 to 025 inch above upper edge of valve with valve closed tight.

Motor Tune-Up — Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .017" Canadian MD3 .020"	Ignition Timing Breaker Points to Open: 10° B. T. C. At Vibration Damper	Float Setting 5/16 Inch (Use Gauge T109-280)	Idle Adjustment Screw Setting 1/4 to 1 1/4 Turns Open Idle Engine at 500 R. P. M. In Neutral

NOTE: These cars are equipped with Hydraulic Valve Lifters — NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3771

Float Level: 5/16 inch (gauge T109-280) between top of each float ridge (at free end of float) and top surface of body casting To adjust bend lip on float arm

Pump: 1 inch from top of the bowl cover to the top of the plunger shaft Install throttle connector rod in center hole medium stroke) of throttle lever To adjust, bend throttle connector rod When throttle connector rod is installed in a different hole for seasonal operation the bowl vapor vent must be readjusted

Fast Idle Linkage Adjustment: With choke valve tightly closed and lug on fast idle cam contacting lip on choke shaft lever align center of fast idle screw with index mark on cam To adjust bend lip on choke shaft lever

Fast Idle Throttle Valve Clearance: 018 inch (gauge T109 44) between lower edge of valve and bore with adjusting screw on index mark of cam

Fast Idle on Car: 1400 R P M hot engine, with fast idle screw on index mark of cam

Unloader: 15/64 inch (gauge T109-32) between top edge of choke valve and inner wall of air horn with throttle valve wide open To adjust bend unloader finger on fast idle arm

Bowl Vapor Vent Adjustment: 062" to 093" (gauge T109-234) between the heel of the rubber grommet and its seat on the bowl cover with throttle valve seated To adjust, bend lip on vapor vent arm If the pump has been changed to the long or short stroke readjust the bowl vapor vent

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3735

FLOAT ALIGNMENT: Side of floats parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding. To adjust, bend float lever.

FLOAT LEVEL: 7/32 inch (gauge T109-106) plus or minus 1/64 inch, between top of floats (at outer end) and air horn gasket. To adjust, bend float lever.

FLOAT DROP: 23/32 inch plus or minus 1/16 inch between top of floats (at outer end) and air horn gasket. To adjust, bend stop tabs on float brackets.

PUMP: 7/16 inch from the top of the bowl cover to the top of the plunger shaft with throttle connector rod in center hole (medium stroke) of pump arm. To adjust, bend throttle connector rod.

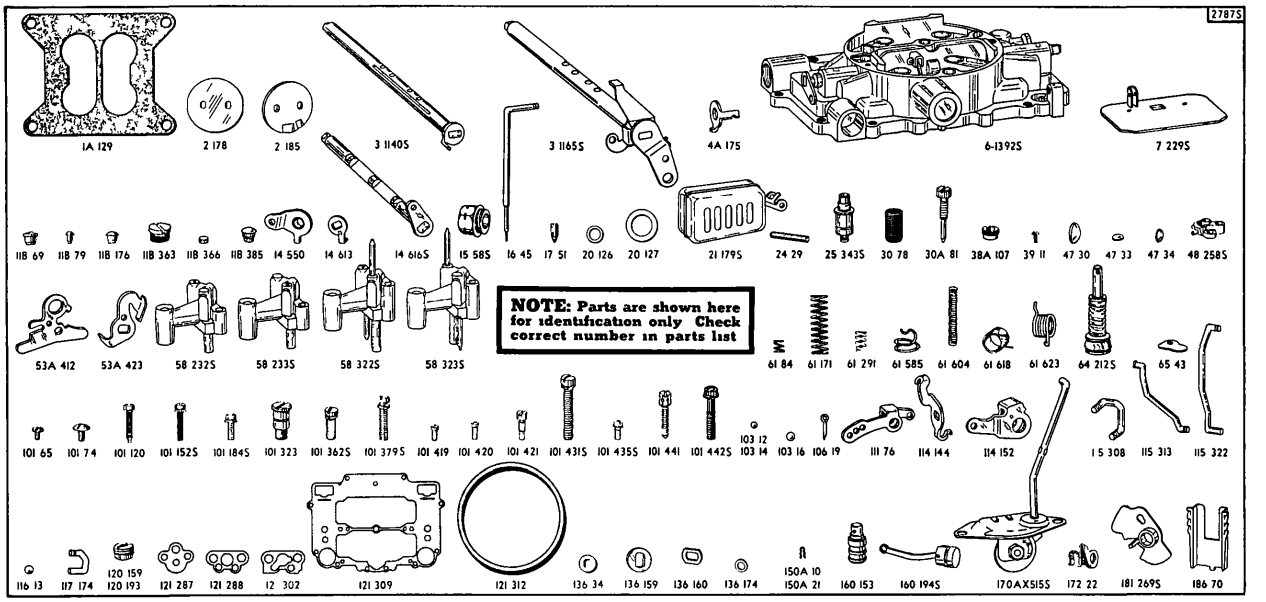
FAST IDLE LINKAGE ADJUSTMENT: With choke valve tightly closed and lug on outer choke shaft lever contacting stop on inner choke shaft lever align center of fast idle screw with index mark on cam. To adjust, bend fast idle connector rod.

FAST IDLE THROTTLE VALVE CLEARANCE: .015 inch (gauge T109-44) between lower edge of valve and bore with adjusting screw on index mark of cam.

FAST IDLE ON CAR: 1400 R. P. M. hot engine with fast idle screw on index mark of cam.

UNLOADER: 1/4 inch (gauge T109-31) between upper edge of choke valve and inner wall of air horn. To adjust, bend unloader lip on throttle lever.

SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Block choke valve wide open. 2. With 3/8 inch between lower edge of primary valve and bore (opposite idle port) secondary valves should just start to open. To adjust, bend throttle operating rod. NOTE: At wide open throttle primary and secondary valves will reach full vertical position. 3. With primary and secondary throttle valves in tightly closed position there should be .010" to .030" (gauge T109-29) between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever.



SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. To adjust, bend tang on secondary throttle lever.

CHOKE ADJUSTMENT (CROSS OVER TYPE) SEE FORM 3661: 1. Loosen mounting post lock nut and turn mounting post with screw driver until index mark on disk is positioned as listed on carbureter specification page. Hold in this position with screw driver and tighten lock nut. NOTE: Screw driver may be held in vise so that one hand may be used to support housing while tightening nut. 2. After adjustment is completed and coil housing and rod assembly and carbureter is installed on engine lift cover disk and open and close choke valve manually to see if connector rod clears sides of hole in housing cover. If rod does not clear hole in housing cover without binding replace with a new unit since connector rod cannot be bent without affecting calibration.

AFB Four-Bore Down-Draft Climatic® Control **Carbureter No. 2801S**

CARBURETER SPECIFICATIONS

For Dodge 8 Cylinder 360 Cu. In. Engine: Vacuum at Idle 19.5 Inches

Dimensions: Flange, four bore—4 bolt type.
Throttle bore 1-7/16 inch
Primary venturi size, primary side 7/16 inch, secondary side, 11/32 inch I D
Main venturi size, 1-3/16 inch

Vents Inside (4) in air horn, Outside (4) in body, (5) in air horn

Low Speed Circuit: (Primary side only)
Jet size No 66 (.033 inch) drill
By-pass, size (.0492 inch) diameter.
Economizer, size (.0492 inch) diameter
Idle bleed, size (.0492 inch) diameter.
Idle port slot type, length .198 inch, width .030 inch

Idle Port Opening: .142 to .148 inch above top edge of valve with valve tightly closed

Set Idle Adjustment Screw: ¾ to 1¾ turns open For richer mixture turn screw out Do not idle engine below 500 r p m Transmission in neutral.

Main Nozzle: Install permanently DO NOT REMOVE Anti-percolator bleed primary (tube in venturi assembly), size No 68 (.031 inch) drill Secondary (drilled hole in venturi assembly) size No 60 (.040 inch) drill

Main Vent Tube: (In venturi assembly) Side holes primary side 1—size No 70 (.028 inch) 1—size No 65 (.035 inch) drill, secondary side 2—size No 57 (.043 inch) 1—size No 70 (.028 inch) drill

Accelerating Pump: Discharge jet (twin) primary side only, size No 70 (.028 inch) drill Intake ball check seat (screw plug) size .115 to .120 inch diameter Discharge needle seat size No 50 (.070 inch) drill

Choke: Carter Climatic® Control Cross Over type set 2 points rich Butterfly type offset valve, primary side only Choke heat suction hole in air horn, size No 44 (.086 inch) drill

Vacuum Spark Port: Slot type (round end) .045 x .110 inch Top of port .026 to .034 inch above top edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .017"	Ignition Timing Breaker Points to Open: 6° B. T. C. At Vibration Damper	Float Setting (See Adjustments)	Idle Adjustment Screw Setting ¾ to 1¾ Turns Open 500 R. P. M. In Neutral

NOTE: These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3735

FLOAT ALIGNMENT: Side of floats parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding. To adjust, bend float lever.

FLOAT LEVEL: 5/16 inch (gauge T109-107) for 21-188S floats (identify by smooth sides); 7/32 inch (gauge T109-106) for 21-179S floats (identify by ribs on floats) between top of floats (at outer end) and air horn gasket. To adjust, bend float lever.

FLOAT DROP: 23/32 inch between top of foats (at outer end) and air horn gasket. To adjust, bend stop tabs on float brackets.

PUMP: 7/16 inch from the top of the bowl cover to the top of the plunger shaft with throttle connector rod in center hole (medium stroke) of pump arm. To adjust, bend throttle connector rod.

FAST IDLE LINKAGE ADJUSTMENT: With choke valve tightly closed and fast idle lug on outer choke shaft lever contacting stop on inner choke shaft lever align center of fast idle screw with index mark on cam. To adjust, bend fast idle connector rod.

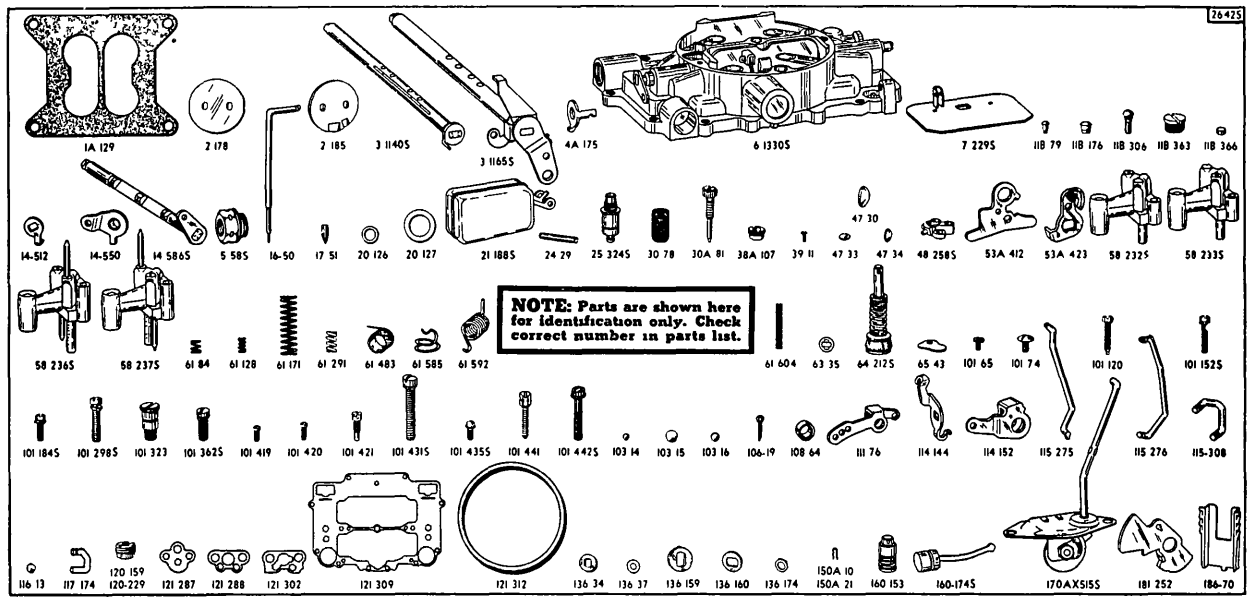
FAST IDLE THROTTLE VALVE CLEARANCE: .012 inch (gauge T109-200) between lower edge of valve and bore with adjusting screw on index mark of cam.

FAST IDLE ON CAR: 1400 R. P. M. hot engine with fast idle screw on index mark of cam.

UNLOADER: 1/4 inch (gauge T109-31) between upper edge of choke valve and inner wall of air horn. To adjust, bend unloader lip on throttle lever.

SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Block choke valve wide open. 2. With 3/8 inch between lower edge of primary valve and bore (opposite idle port) secondary valves should just start to open. To adjust, bend throttle operating rod. NOTE: at wide open throttle primary and secondary valves will reach full vertical position. 3. With primary and secondary throttle valves in tightly closed position there should be .010" to .030" (gauge T109-29) between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever.

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. To adjust, bend tang on secondary throttle lever.



CHOKE ADJUSTMENT (CROSS OVER TYPE) SEE FORM 3661: 1. Loosen mounting post lock nut and turn mounting post with screw driver until index mark on disk is positioned as listed on carbureter specification page. Hold in this position with screw driver and tighten lock nut. NOTE: Screw driver may be held in vise so that one hand may be used to support housing while tightening nut. 2. After adjustment is completed and coil housing and rod assembly and carbureter is installed on engine lift cover disk and open and close choke valve manually to see if connector rod clears sides of hole in housing cover. If rod does not clear hole in housing cover without binding replace with a new unit since connector rod cannot be bent without affecting calibration.

CARTER MODEL AFB CARBURETER FOR DODGE (SERVICE ADJUSTMENT PROCEDURE)

NOTE: The parts and specification pages referred to are catalog pages. These pages can be obtained from Carter Carburetor, Catalog Department, St. Louis (7), Missouri. Specify the carbureter number found on the base of the carbureter, when requesting specification pages.

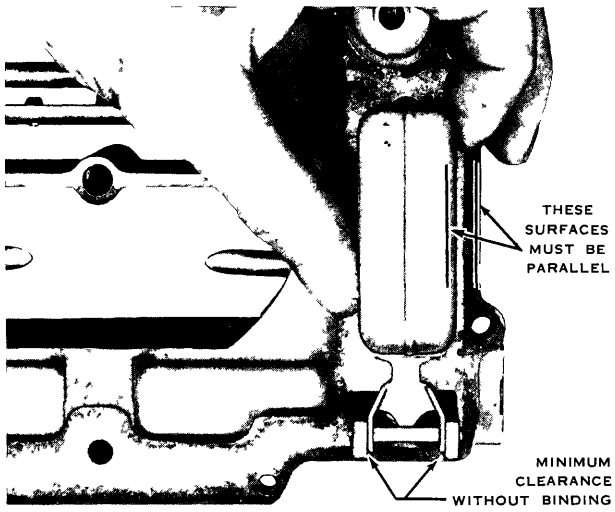

Figure 1

FLOAT ALIGNMENT ADJUSTMENT (Fig. 1):

1. Sight down the side of the float shell to determine if the side of the float is parallel to the outer edge of the air horn casting. TO ADJUST: Bend float lever by applying pressure to the end of the float shell with the fingers while supporting the float lever with the thumb.

   CAUTION: To avoid damaging the float, apply only enough pressure to bend float lever.

2. After aligning float, remove as much clearance as possible between arms of float lever and lugs on air horn by bending the float lever. Arms of float lever should be as parallel to the inner surfaces of lugs on air horn as possible.

   Floats must operate freely without excess clearance on its hinge pin.

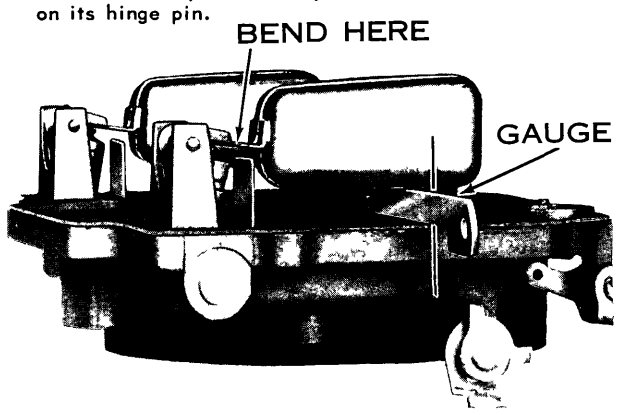

Figure 2

FLOAT LEVEL ADJUSTMENT (Fig. 2):

With air horn inverted, bowl cover gasket in place and needle seated, the clearance between top of float (at outer end) and air horn gasket should be as listed on carbureter specification page. To adjust, bend float arm. Adjust both floats. Recheck float alignment.

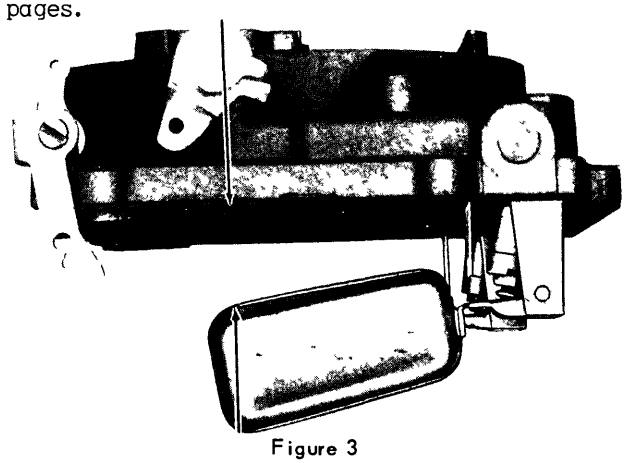

Figure 3

FLOAT DROP ADJUSTMENT (Fig. 3):

With bowl cover held in upright position and measuring from outer end of each float, the distance between top of floats and bowl cover gasket should be as listed on carbureter specification page. To adjust, bend stop tabs on float brackets.

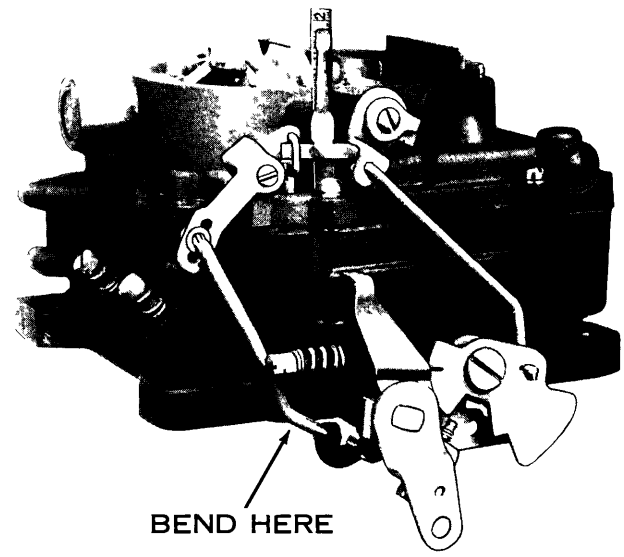

Figure 4

PUMP ADJUSTMENT (Fig. 4):

1. Back out idle speed screw until throttle valves seat in bores of carbureter. NOTE: Be sure fast idle adjusting screw does not contact fast idle cam and hold throttle valves open.
2. With throttle connector rod in center hole (medium stroke) of pump arm, the distance from the top of the bowl cover to the top of the plunger shaft should be as listed on carbureter specification page.
3. Adjust by bending throttle connector rod at lower angle (use tool T109-213).

CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

S S PRINTED IN U.S.A.

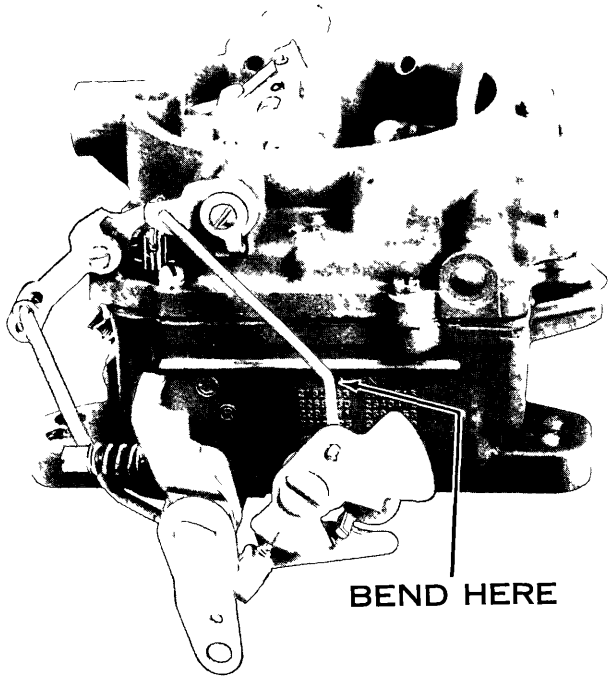

Figure 5

FAST IDLE LINKAGE ADJUSTMENT (Fig. 5):

With choke valve tightly closed and lug on outer choke shaft l ver contacting stop on inner choke shaft lever align center f fast idle screw with index mark on cam. T adjust, bend fast idle connector rod. (Use tool T109-213.)

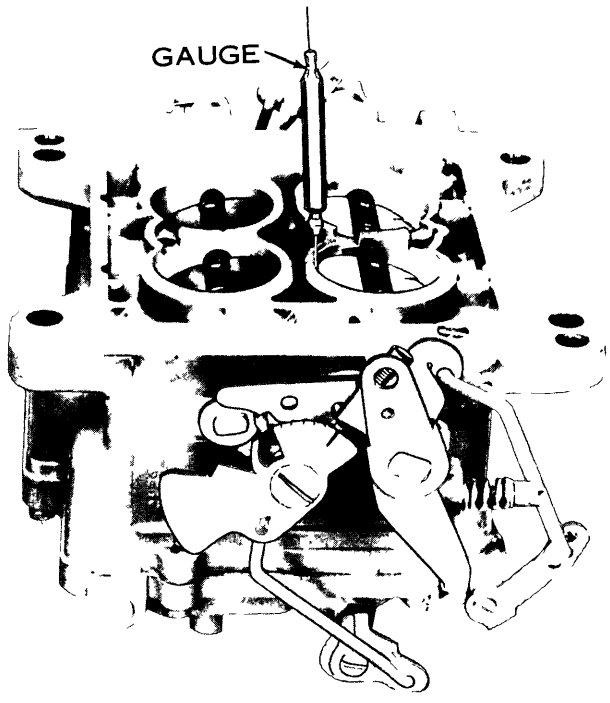

Figure 6

FAST IDLE THROTTLE VALVE CLEARANCE ADJUSTMENT (Fig. 6):

With choke valve tightly closed, tighten fast idle adjusting screw (on index mark of cam) until the clearance between throttle valve and bore of carbureter, side opposite idle port, is as listed on carbureter specification page.

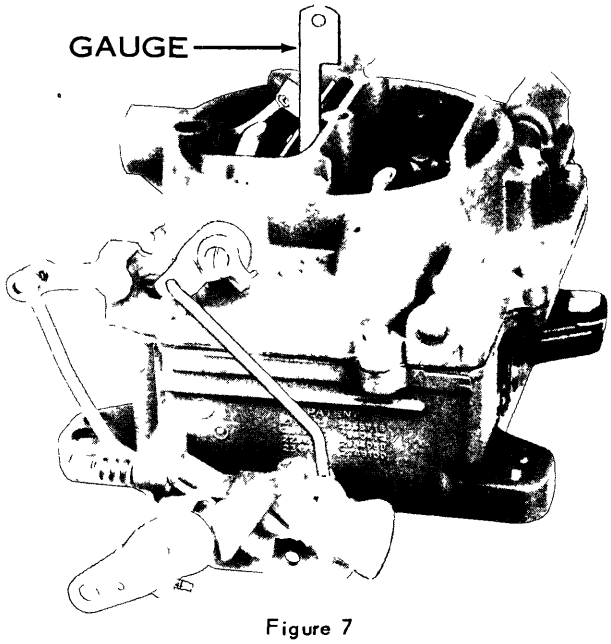

Figure 7

UNLOADER ADJUSTMENT (Fig. 7):

With throttle wide open, th clearance between upper edge of choke valve and inner wall f air horn sh uld be as listed on carbureter specification page. To adjust, bend unloader lip on throttle shaft lever. (Use tool T109-41.)

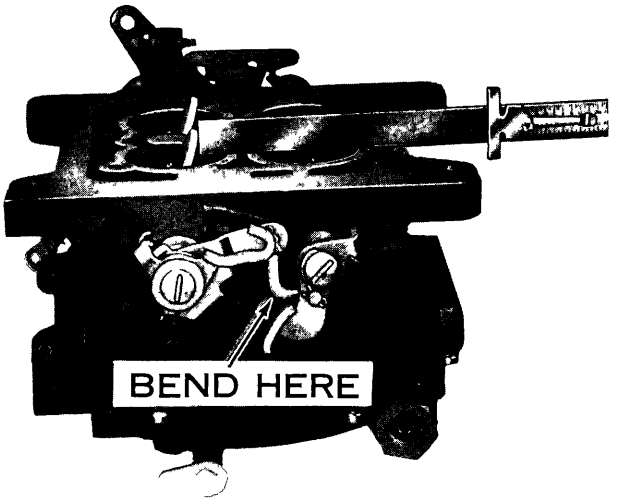

Figure 8A

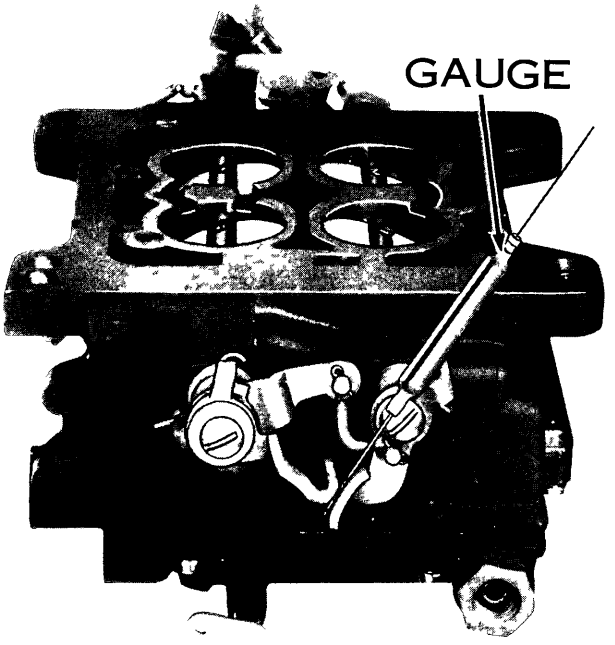

Figure 8B

SECONDARY THROTTLE LEVER ADJUSTMENT (Figs. 8A & 8B):

1. Block choke valve wide open
2. Secondary throttle valves should just start to open when primary throttle valves are opened to the clearance as listed on specification page between lower edge of valve and bore (opposite idle port). To adjust, bend throttle operating rod. (Use bending tool T109-213). (See Fig. 8A) NOTE: Primary and secondary throttle valves should reach wide open position, full vertical, at th same time.
3. With primary and secondary throttle valves in tightly closed position, there should be the clearance as listed on specification page between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever. (Se Fig. 8B)

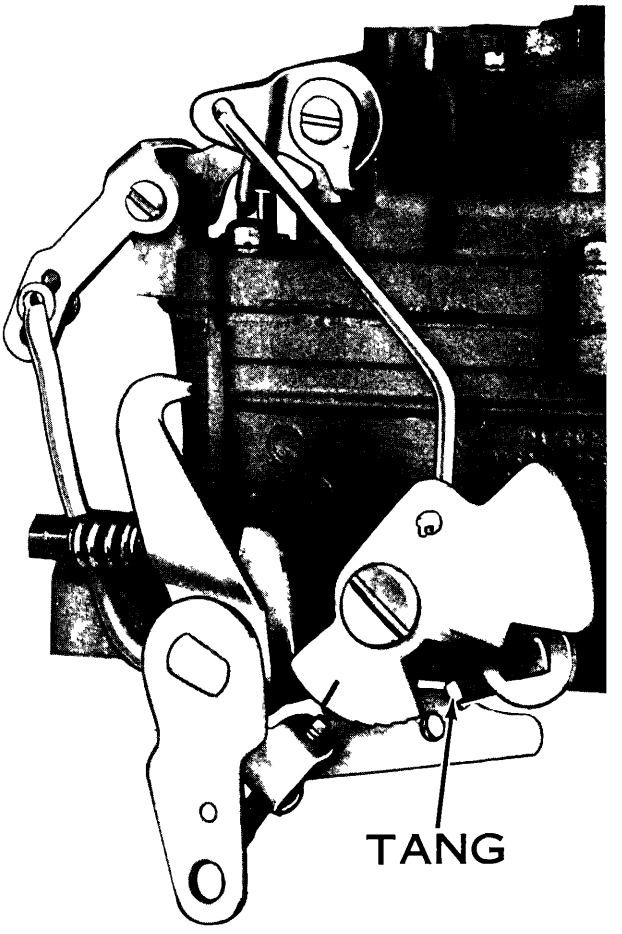

Figure 9

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT (Fig. 9):

Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle l ver should freely engage in notch of lock-out dog. If necessary to adjust, bend tang on secondary throttle lever.

NOTE: See last page for pertinent service information.

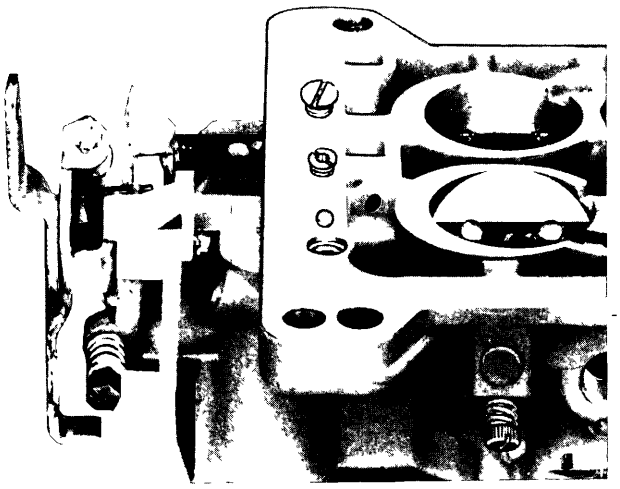

Figure 10

(Fig. 10):

Pump intake check ball, seat and screw plug are removed by inverting carbureter and removing from lower side of flange.

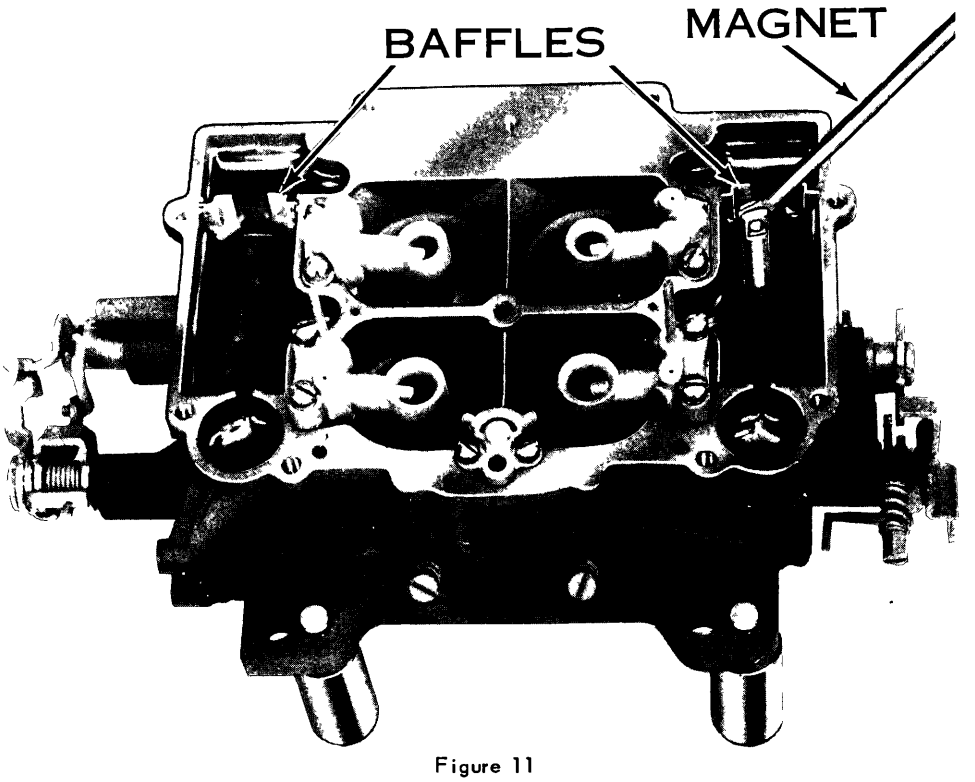

Figure 11

(Fig. 11):

Flooding, stumble on acceleration and other performance complaints are, in many instances, caused by the presence of dirt, water or other foreign matter in the carbureter. To aid in diagnosing the cause of the complaint, the carbureter should be carefully removed from the engine without draining the fuel from the bowl. The contents of the fuel bowl may then be examined for contamination as the carbureter is disassembled.

Check the fuel in the bowl for contamination by dirt, water, gum or other foreign matter. A magnet moved through the fuel in the bowl will pick up and identify any iron oxide dust that may have caused intake needle and seat leakage.

Inspect gasketed surfaces between body and air horn. Small nicks or burrs should be smoothed down to eliminate air or fuel leakage. Be especially particular when inspecting the top surface of the inner wall of the bowl around the vacuum piston passage. A poor seal at this location may contribute to a "cutting-out" on turns complaint.

Install fuel baffles as shown (Fig. 11) to prevent damage to floats. Use caution when installing air horn assembly. Baffles on air horn assembly must fit inside of fuel bowl baffles toward primary side of carbureter.

Fill the carbureter bowl with clean fuel before installing on the manifold. This will help prevent dirt trapped in the fuel system from being dislodged by the free flow of fuel as the carbureter is primed. The operation of the floats and intake needle and seats may be checked under pressure if a fuel pump is used at the bench to fill the carbureter bowl. Operate the throttle several times and visually check the discharge from the pump jets.

Before installing the carbureter, hold choke valve open and turn the idle speed screw until it just contacts the throttle lever, then 1/2 a turn more to open the throttle valves enough to keep the engine running until the idle mixture and final R.P.M. adjustment can be made.

MODEL LD2-M

POWER PACKAGE

1958

WCFB Four-Bore Down-Draft Climatic® Control Carbureter No. 2660S

CARBURETER SPECIFICATIONS

For Dodge 8 Cylinder 325 Cu. In. Engine: Vacuum at Idle 19.5 Inches

Dimensions: Flange size 1¼ inch Four Bore—4 bolt type
Primary venturi size 11/32 inch I D
Main venturi size 1-3/16 inch I D

Vents: Inside (5)

Low Speed Circuit: Jet size No 67 (.032 inch) drill By pass tube in body size (.057 inch) diameter Economizer, plug in body size No 56 (.0465 inch) drill Idle bleed in body, size No 46 (.081 inch) drill Idle port, slot type primary length 140 inch width 030 inch Secondary length 103 inch width 030 inch

Idle Port Opening: Primary 092 to 098 inch secondary 065 to 071 inch above top edge of valve with valve tightly closed

Lower Port: Primary (for idle adjustment screw), size No 53 (.0595 inch) drill Secondary (no idle adjustment screw) size No 57 (.043 inch) drill

Set Idle Adjustment Screw: ½ to 1½ turns open For richer mixture turn screw out Do not idle engine below 500 R P M in neutral

Main Nozzle: Installed permanently DO NOT REMOVE Anti percolating jet (4) size No 70 (.028 inch) drill

Accelerating Pump: Discharge jet (twin) primary side only size No 70 (.028 inch) drill Intake ball check seat size 115 to 120 inch diameter Discharge needle seat size No 50 (.070 inch) drill Relief passage (vent) to fuel chamber size No 42 (.0935 inch) drill

Choke: Carter Climatic® Control Cross Over Type set on index Butterfly type offset choke valve primary side only Choke heat suction hole restriction in piston housing size No 40 (.098 inch) drill

Vacuum Spark Port: Horizontal slot (round end) .045 x .110 inch Top of port .022 to .032 inch above top edge of valve with valve tightly closed

Motor Tune-Up — Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .017"	Ignition Timing Breaker Points to Open 6° B T C At Vibration Damper	Float Setting Primary 7/32 Inch (Gauge T109-283) Secondary 9/32 Inch (Gauge T109-284)	Idle Adjustment Screw Setting ½ to 1½ Turns Open Idle engine at 500 R P. M in neutral

NOTE: These cars are equipped with Hydraulic Valve Lifters — NO ADJUSTMENT.

MARCA REGISTRADA

SS PRINTED IN U.S.A.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical **LATERAL ADJUSTMENT:** With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting Side of floats should just clear the vertical uprights of float gauge Adjustment should be made by bending arms of floats **VERTICAL ADJUSTMENT:** With float gauge in same position floats should just clear the horizontal portion of gauge Vertical distance between top of float and machined surface of casting must be 7/32" (gauge T109-283) for primary floats and 9/32 (gauge T109-284) for secondary floats Adjust by bending float arms

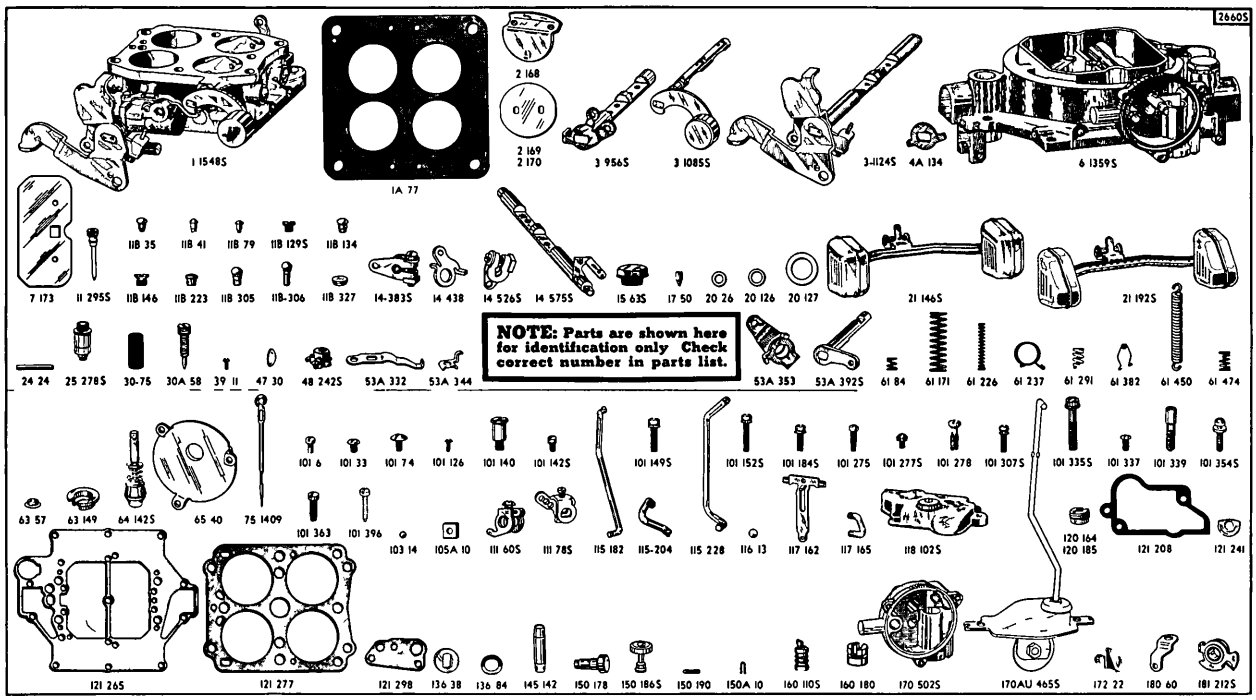
FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of floats, the distance between top of floats and bowl cover should be 23/32 for primary floats and 25/32 for secondary floats Adjust by bending stop tabs on float bracket

PUMP ADJUSTMENT: Install pump connector link in center hole (medium stroke) of pump arm, with ends extending toward countershaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter Hold sraight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bend ing throttle connector rod at lower angle (Use tool T109 213)

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment No metering rod gauges are necessary Procedure is as follows 1 Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw 2 With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting 3 Holding rods in downward position and throttle valves seated revolve metering rod arm until finger on arm contacts lip of vacumeter link Hold in place and carefully tighten clamp screw

BOWL VAPOR VENT ADJUSTMENT: This adjustment should be made after completing pump and metering rod adjustments Install dust cover and dust cover gasket Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter There should be 1/16 inch (gauge T109-197) between lower edge of bowl vapor vent valve and dust cover To adjust remove dust cover and bend vapor vent arm

FAST IDLE ADJUSTMENT: (a) Loosen choke lever clamp screw on choke shaft Insert 020 ' feeler gauge (T109-29) between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing lever towards closed position—hold in place and tighten clamp screw (b) With choke valve tightly closed, tighten fast idle adjusting screw until there is 010 (gauge T109-200) opening between throttle valve and bore of carbureter (side opposite idle port) Be sure fast idle adjusting screw is on high step of cam while making this adjustment



FAST IDLE ON CAR: 1400 R P M , with fast idle screw on high step of cam

UNLOADER ADJUSTMENT: With throttle wide open there should be 11/64 clearance between upper edge of choke valve and inner wall of air horn (gauge T109-166) Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41)

SECONDARY THROTTLE LEVER ADJUSTMENT: The stop lug on both primary and secondary throttle levers should contact boss on flange at the same time To adjust bend secondary throttle operating rod at angle (use bending tool T109-213)

AUXILIARY THROTTLE LOCK-OUT ADJUSTMENT: This adjustment should be made after completing fast idle adjustment 1 With choke valve closed, edge of hook on lockout arm should contact auxiliary throttle lever making maximum contact of locking step on lever 2 Open choke valve Auxiliary throttle valve should become unlocked a few degrees before the choke reaches wide open position Adjust by bending lockout arm

CHOKE ADJUSTMENT (CROSS OVER TYPE) See Form 3661: 1 Loosen mounting post lock nut and turn mounting post with screw driver until index mark on disk is positioned as listed on carbureter specification page Hold in this position with screw driver and tighten lock nut NOTE screw driver may be held in vise so that one hand may be used to support housing while tightening nut 2 After adjustment is completed and coil housing and rod assembly and carbureter is installed on engine lift cover disk and open and close choke valve manually to see if connector rod clears sides of hole in housing cover If rod does not clear hole in housing cover without binding replace with a new unit since connector rod cannot be bent without affecting calibration

1957

WCFB Four-Bore Down-Draft Climatic® Control **Carbureter No. 2698S**

CARBURETER SPECIFICATIONS

For Dodge 8 Cylinder Engine 3.69 Inch Bore, 3.80 Inch Stroke • Vacuum at Idle 19.5 Inches

Dimensions: Flange size 1¼ inch Four Bore – 4 bolt type
Primary venturi size, 11/32 inch I. D.
Main venturi size, 1-3/16 inch I. D.

Vents: Inside, (5).

Gasoline Intake, Size No. 42 (.0935 inch) drill, in needle seat.

Low Speed Jet Tube: Jet, size (.035 inch) diameter. By-pass, tube in body, size (.057 inch) diameter. Economizer plug in body, size (.0465 inch) diameter. Idle bleed, in body, size No. 46 (.081 inch) drill.

Idle Port: Upper, slot type, primary, length .150 inch, width .030 inch. Secondary, length .103 inch, width .030 inch.

Idle Port Opening: Primary .082 to .088 inch, secondary .065 to .071 inch above top edge of valve with valve tightly closed.

Lower Port: Primary (for idle adjustment screw), size No. 53 (.0595 inch) drill. Secondary (no idle adjustment screw), size No. 57 (.043 inch) drill.

Set Idle Adjustment Screw: ¼ to 1¼ turns open. For richer mixture turn screw out. Do not idle engine below 500-600 R.P.M. in neutral.

Main Nozzle: Installed permanently. DO NOT REMOVE. Anti-percolating jet (4) size No. 70 (.028 inch) drill.

Metering Rod: *(Vacumeter type) see parts list for size.*

Metering Rod Jet: Primary Size .098 inch diameter. Secondary Size .082 inch diameter.

Accelerating Pump Discharge jet (twin) primary side only, size No. 74 (.0225 inch) drill. Intake ball check seat, size .115 to .120 inch diameter. Discharge needle seat, size No. 50 (.070 inch) drill. Relief passage (vent) to fuel chamber, size No. 42 (.0935 inch) drill.

Choke: Carter Climatic® Control Cross Over Type set on index. Butterfly type offset choke valve, primary side only. Choke heat suction hole, restriction in piston housing, size No. 40 (.098 inch) drill.

Vacuum Spark Port: Horizontal slot (round end) .045 x .110 inch. Top of port .022 to .032 inch above top edge of valve with valve tightly closed

Motor Tune-Up – Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carburet r.

Spark Plug Gap	Breaker Point Setting	Ignition Timing Breaker Points to Open	Float Setting	Idle Adjustment Screw Setting
.035"	.017"	6° B. T. D. C. At Vibration Damper	Primary 7/32 Inch (Gauge T109-283) Secondary 9/32 Inch (Gauge T109-284)	¼ to 1¼ Turns Op n Idl ngine at 500-600 R.P.M. in neutral

NOTE: Th s cars are equipped with Hydraulic Valve Lifters – NO ADJUSTMENT.

S S PRINTED IN U.S.A.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made–lateral and vertical. **LATERAL ADJUSTMENT:** With bowl cover assembly inverted bowl cover gasket removed and float resting on seated needle, place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting. Side of floats should just clear the vertical uprights of float gauge. Adjustment should be made by bending arms of floats. **VERTICAL ADJUSTMENT:** With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance between top of float and machined surface of casting must by 7/32" (gauge T109-283) for primary floats; and 9/32" (gauge T109-284) for secondary floats. Adjust by bending float arms.

FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of floats, th distance between top of floats and bowl cover should be 23/32" for primary floats and 25/32" for secondary floats. Adjust by bending stop tabs on float bracket.

PUMP ADJUSTMENT: Install pump connector link in center hole (medium stroke) of pump arm, with ends extending toward countershaft arm. Back out throttle lever set screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at lower angle. (Use tool T109-213.)

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. 2. With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.

BOWL VAPOR VENT ADJUSTMENT: This adjustment should be made after completing pump and metering rod adjustments. Install dust cover and dust cover gasket. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter. There should be 1/16 inch (gauge T109-197) between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm.

FAST IDLE ADJUSTMENT: (a) Loosen choke lever clamp screw on choke shaft. Insert .020" feeler gauge (T109-29) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing lever towards closed position – hold in place and tighten clamp screw. (b) With choke valve tightly closed, tighten fast idle adjusting screw until there is .010" (gauge T109-200) opening between throttle valve and bore of carbureter (side opposite idle port). Be sure fast idle adjusting screw is on high step of cam while making this adjustment.

FAST IDLE ON CAR: 1350 to 1400 R.P.M.

UNLOADER ADJUSTMENT: With throttle wide open there should be 15/64" clearance between upper edge of choke valve and inner wall of air horn (gauge T109-32). Adjust be bending unloader lip on throttle shaft lever (use bending tool T109-41).

SECONDARY THROTTLE LEVER ADJUSTMENT: The stop lug on both primary and secondary throttle levers should contact boss on flange at the same time. To adjust bend secondary throttle operating rod at angle (use bending tool T109-213).

AUXILIARY THROTTLE LOCK-OUT ADJUSTMENT: This adjustment should be made after completing fast idle adjustment. 1. With choke valve closed, edge of hook on lockout arm should contact auxiliary throttle lever, making maximum contact of locking step on lever. 2. Open choke valve. Auxiliary throttle valve should become unlocked a few degrees before the choke reaches wide open position. Adjust by bending lockout arm.

CHOKE ADJUSTMENT (CROSS OVER TYPE) See Form 3661: 1. Loosen mounting post lock nut and turn mounting post with screw driver until index mark on disk is positioned as listed on carbureter specification page. Hold in this position with screw driver and tighten lock nut. NOTE: Screw driver may be held in vise so that one hand may be used to support housing while tightening nut. 2. After adjustment is completed and coil housing and rod assembly and carbureter is installed on engine lift cover disk and open and close choke valve manually to see if connector rod clears sides of hole in housing cover. If rod does not clear hole in housing cover without binding replace with a new unit since connector rod cannot be bent without affecting calibration.

Dodge "V-8" – 1957 – Carbureter No. 2698S

WHEN SERVICING, USE GASKET ASSORTMENT No. 299

BBS Down-Draft Climatic® Control **Carbureters Nos. 2658S-2659S**

CARBURETER SPECIFICATIONS

For Dodge Six Cylinder 230 Cu. In. Engine Vacuum at Idle 17 Inches

Dimensions: Flange size 1½ inch, S A E
Throttle bore 1 11/16 inch
Main venturi 1 11/32 inch I D

Vents: Outside none Inside balance vent tube

Low Speed Circuit: Jet, size 0315 inch diameter Idle passage air bleed in body, size 061 inch diameter Restriction in body size 057 inch diameter Idle port slot type, length 195 inch, width 030 inch

Idle Port Opening: Top of port located 140 to 144 inch above top edge of valve, with valve tightly closed

Lower Port (For Idle Adjustment Screw): Size 053 to 057 inch diameter

Set Idle Adjustment Screw: ½ to 1½ turns open For richer mixture turn screw out Idle engine at 500 r p m in neutral

Main Vent Tube: Side holes 6—0354 inch diameter Bleed in top of tube 0236 inch diameter

Accelerating Pump: Pump intake passage ball check seat, size 110 to 120 inch diameter Pump discharge passage ball check seat 110 to 120 inch diameter in body Pump (discharge) jet, size 0275 inch drill Bleed hole in pump plunger plate size 020 inch diameter

Choke: Carter Climatic® Control, set on index Choke heat suction hole, in body size No 38 (1015 inch) drill NOTE Thermostatic coil should not be removed from delayer mounting post If defective replace with complete thermostatic coil and housing assembly

Vacuum Spark Port: Slot (round end) type Size 030 by 110 inch Top of port 044 to 050 inch above top edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION· Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .020"	Ignition Timing Breaker Points to Open· 2° B. T. D. C. At Vibration Damper	Valve Setting (Hot) Intake .010" Exhaust .014"	Float Setting 7/32 Inch (Use Gauge T109-239)	Idle Adjustment Screw Setting ½ to 1½ Turns Open Idle Engine at 500 R.P.M. In Neutral

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: This adjustment must be made with the bowl cover gasket and float pin retainer removed Hold the lip on float arm against the seated intake needle, making sure the float pin is at the bottom of its guide slots The distance from the top surface of the body casting to the top of each float should be 7/32 inch (gauge T109-239) If one float is lower than the other, equalize by bending the float arm If both floats require the same correction, adjust by bending lip on float arm The floats must not rub anywhere against the inner walls of the bowl If necessary bend float arms slightly to provide clearance on all sides of floats

PUMP ADJUSTMENT Back out throttle adjusting screw and open choke valve so that throttle valve seats in bore of carbureter Install throttle connector rod in center hole of throttle lever The distance from the top of the bowl cover to the top of plunger shaft (not pump arm) should be 54/64 inch Adjust by bending throttle connector rod at lower angle (use Tool T109-213)

FAST IDLE ADJUSTMENT· Remove thermostatic coil housing assembly, gasket and baffle plate With throttle adjusting screw backed out, crack throttle valves and hold

PRINTED IN U S A

choke valve in fully closed position Then close throttle This will allow fast idle cam to revolve to fast idle position There should now be 016- 020 inch clearance (use gauge T109-44) between throttle valve and bore of carbureter (side opposite idle port) Adjust by bending the choke connector rod at lower angle (use Tool T109-213)

CAUTION: Be sure cam trip lever is all the way in piston housing with lug contacting cam

FAST IDLE ON CAR 1600 to 1700 R P M hot engine, with choke trip lever on high step of cam

UNLOADER ADJUSTMENT This adjustment must be made after the fast idle adjustment Hold throttle valve wide open and close choke valve as far as possible without forcing There should now be 9/64 inch clearance (use gauge T109-34) between upper edge of choke valve and inner wall of air horn Adjust by bending arm on choke trip lever (use tool T109-214) When fast idle and unloader adjustments have been made assemble baffle plate, coil housing gasket and thermostatic coil housing assembly on air horn Set Climatic® Control as specified making sure that hook on coil has picked up coil shaft lever

DASHPOT (SLOW CLOSING THROTTLE ADJUSTMENT). (2659S only) The purpose of the dashpot is to prevent the car from stalling when the throttle is released rapidly Maximum dashpot action is obtained by loosening lock nut and adjusting the dashpot unit so that the dashpot plunger shaft can be moved inward approximately 3/32 inch with the throttle valve tightly closed Then tighten lock nut

BBR2 DOWN-DRAFT CARBURETER No. 2681S

CARBURETER SPECIFICATIONS

For Dodge Truck 6 Cylinder Engine: 3.25 Inch Bore, 4.63 Inch Stroke

Dimensions: Flange size 1½ inch Throttle bore 1 11/16 inch Main venturi, 1-11/32 inch I D

Float Setting: See adjustments
Vents: Outside none Inside balance vent tube 218 inch diameter

Gasoline Intake Needle: Triangular horizontal No 44 (086 inch) drill in needle seat

Idle Orifice Tube: Jet size 0276 inch drill Idle passage air bleed in air horn size 053 inch diameter Restriction in body size 0452 inch diameter

Idle Ports: Upper port Slot type length 149 inch width 030 inch Top of port located 118 to 122 inch above top edge of valve Lower port size 053 to 057 inch drill (For idle adjustment screw)

Set Idle Adjustment Screw: 1 to 2 turns open For richer mixture turn screw out Idle engine between 450 500 r p m

Main Metering Jet: Calibrated to flow 315 to 319 cc per minute (Do not gauge for size If in doubt replace with new part)

Main Vent: Through diffuser (air bleed inside bowl) Size 0315 inch drill

Main Vent Tube: Side holes 4—0354 inch diameter

Step-Up Jet: Power orifice 0315 inch drill

Accelerating Pump: Type—delayed action seasonal adjustment Stroke—Summer setting (inner hole, short stroke) Intermedi ate setting (center hole) Winter setting (outer hole long stroke) Pump intake passage ball check seat size 115 to 120 inch diameter in body Pump discharge passage Restriction (under ball check) size 062 to 065 inch diameter in body Pump (discharge) jet size 0374 inch drill

Pump Adjustment: 26/64 inch plunger travel—full throttle posi tion medium stroke Use gauge T109-117S

Choke: Offset butterfly type (with poppet valve)

Vacuum Spark Port: Slot (round end) type size 040 by 110 inch Top of port 052 to 058 inch above top edge of valve

Motor Tune-Up — Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .020"	Ignition Timing Breaker Points to Open T. D. C. At Vibration Damper	Valve Setting (Hot) Intake .010" Exhaust 014"	Float Setting 5/64 Inch (Use Gauge T109 50)	Idle Adjustment Screw Setting 1 t 2 Turns Open Idle engine at 450 to 500 R.P.M. In Neutral

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: This adjustment must be made with the bowl cover gasket and float pin retainer removed Place a 050 inch feeler gauge (T109-226) between lip of float and intake pin Hold the lip on float arm against the seated intake needle fully compressing the intake needle spring The distance from the top surface of the body casting to the top of the float should be 5/64 inch (gauge T109 50) To adjust bend lip on float arm

PUMP ADJUSTMENT: Remove air horn assembly back out throttle adjustment screw and be sure pump operating link is in center of throttle shaft arm Place Universal pump travel gauge T109 117S on edge of bowl cover so that lip of gauge extends over top of plunger shaft With throttle valve seated turn knurled nut of gauge until lip contacts top of plunger shaft Take reading indi cated on gauge Repeat with throttle valve wide open and plung er pushed to bottom of cylinder The difference in reading obtained should be '26' (26/64 inch) Adjust by bending hori zontal portion of pump lifter link
Pump stroke adjustable for high or low temperatures Set to long est stroke for cold weather shorter stroke for hot weather driving

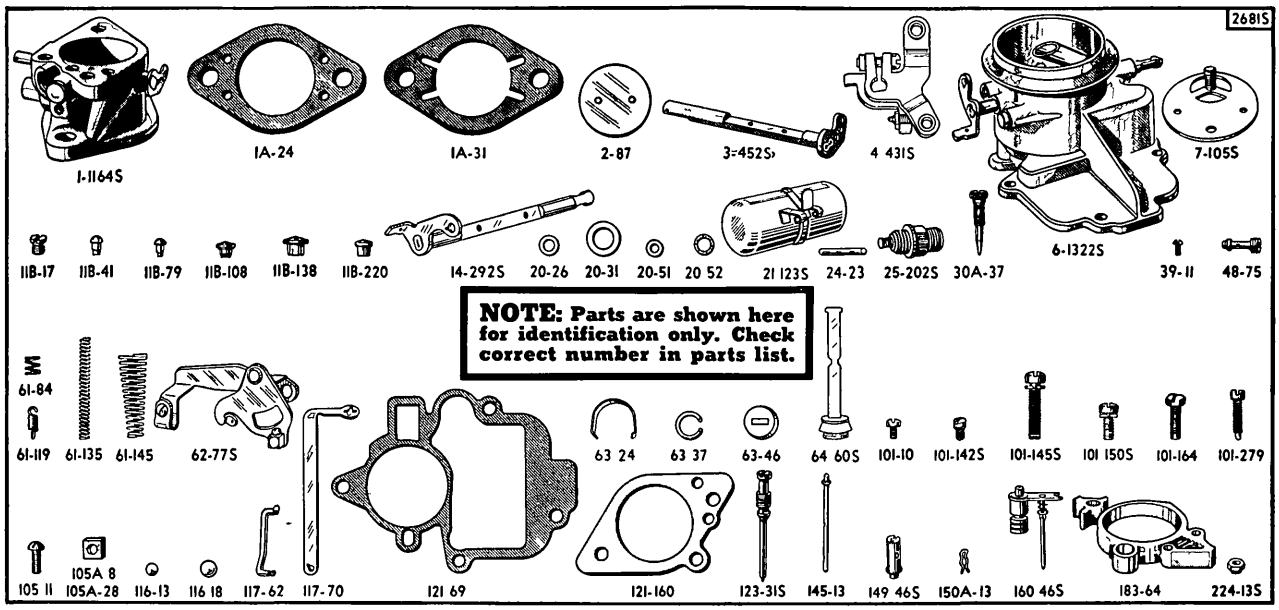
EXCESSIVE RICHNESS above 50 miles per hour may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with tool No T109-210 main vent tube can be removed and a new tube inserted with tool No T109 195 Care must e exercised in inserting new tube which must seat tightly Use new rivet to complete the installation

MAXIMUM ECONOMY and performance are secured only when breaker points spark plugs valves and motor timing are set to manufacturer s specifications After motor is properly tuned the following should also be done to insure satisfactory performance and economy



(a) Float level must be set as above

(b) Step up rod in step up jet must seat and move freely When reassembling jet must be screwed in tight against seat

(c) Step up piston in body casting should not bind and must be free of dirt

(d) Main metering jet can be replaced with leaner than stand ard metering jets for altitude

CAUTION: Do not attempt to gauge metering jets with drills These jets have been flow tested to insure correct fuel flow

BBD DUAL DOWN-DRAFT CARBURETERS Nos. 2620S-2620SA

CARBURETER SPECIFICATIONS

For Dodge Truck 8 Cylinder Engine: 3.94 Inch Bore, 3.63 Inch Stroke

Dimensions: Flange size, 1 1/4 inch dual, 4 bolt type. Throttle bore, 1-7/16 inch I. D. Primary venturi, 3/8 inch I. D. Main venturi, 1-3/16 inch I. D.

Vent: Inside, balance vent tube to bowl, in air horn above choke valve.

Gasoline Intake: Size No. 38 (.1015 inch) drill hole in needle seat.

Idle Tube: Jet, in venturi assembly, size .0255 inch diameter. Idle bleed (in venturi cluster screw), size .051 inch diameter. Idle restriction (in venturi cluster screw), size .055 inch diameter.
Venturi idle bleed, in body, size .0472 inch diameter.

Models S have idle passage through top of venturi cluster; Models SA have diagonal passage to screw hole.

Idle Port: Upper, slot type, length .195 inch; width, .030 inch.

Idle Port Opening: .140 to .144 inch above upper edge of valve with valve tightly closed.

Lower Port (For Idle Adjustment Screw): Size .053 to .057 inch diameter.

Set Idle Adjustment Screw: 1/4 to 1 1/4 turns open. For richer mixture, turn screw out. With gear shift lever in neutral position, idle engine at 450 to 500 R.P.M.

Main Nozzle: Nozzle is installed permanently. DO NOT REMOVE.

Main Vent Tube: Side holes 10—size .0433 inch, 1—size .0393 inch diameter.
Main vent in bottom of tube, size .0393 inch diameter.

Step-Up Rod: (Vacuum operated) .024 inch diameter.

Metering Jet: Calibrated to flow 337 to 343 cc per minute. (Do not gauge for size, if in doubt, replace with new part.)

Accelerating Pump: Pump discharge jets (2—in venturi cluster), size .0275 inch diameter. Intake ball check seat, size .130 to .140 inch diameter. Discharge ball check seat, size .110 to .120 inch diameter.

Choke: Manual, offset butterfly type, with poppet valve.

Vacuum Spark Port: None.

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .017"	Ignition Timing Breaker Points to Open: 4° B. T. D. C. At Vibration Damper	Float Setting 9/32 Inch (Use Gauge T109-239)	Idle Adjustment Screw Setting 1/4 to 1 1/4 Turns Open Idle engine at 450 to 500 R.P.M. In Neutral

NOTE: These trucks equipped with Hydraulic Valve Lifters. NO ADJUSTMENT.

BBD Dual Down-Draft **Carbureters Nos. 2550S-2550SA**

CARBURETER SPECIFICATIONS

For Dodge 8 Cylinder Engine: 3.94 Inch Bore, 3.63 Inch Stroke

Dimensions: Flange size, 1¼ inch dual, 4 bolt type. Throttle bore, 1-7/16 inch I. D. Primary venturi, ⅜ inch I. D. Main venturi, 1-3/16 inch I. D.

Vent: Inside, balance vent tube to bowl, in air horn above choke valve.

Gasoline Intake: Size No. 38 (.1015 inch) drill hole in needle seat.

Idle Tube: Jet, in venturi assembly, size .0255 inch diameter. Idle bleed (in venturi cluster screw), size .051 inch diameter. Idle restriction (in venturi cluster screw), size .055 inch diameter. Venturi idle bleed, in body, size .0472 inch diameter. Models S have idle passage through top of venturi cluster; models SA have diagonal passage to screw hole.

Idle Port: Upper, slot type, length .195 inch; width, .030 inch.

Idle Port Opening: .140 to .144 inch above upper edge of valve with valve tightly closed.

Lower Port (For Idle Adjustment Screw): Size .053 to .057 inch diameter.

Set Idle Adjustment Screw: ¼ to 1¼ turns open. For richer mixture, turn screw out. With gear shift lever in neutral position, idle engine at 500 R.P.M.

Main Nozzle: Nozzle is installed permanently. DO NOT REMOVE.

Main Vent Tube: Side holes 10—size .0433 inch, 1—size .0393 inch diameter. Main vent in bottom of tube, size .0393 inch diameter.

Step-Up Rod: (Vacuum operated) .019 inch diameter.

Metering Jet: Calibrated to flow 317 to 323 cc per minute. (Do not gauge for size, if in doubt, replace with new part.)

Accelerating Pump: Pump discharge jets (2—in venturi cluster), size .0275 inch diameter. Intake ball check seat, size .130 to .140 inch diameter. Discharge ball check seat, size .110 to .120 inch diameter.

Choke: Manual, offset butterfly type, with poppet valve.

Vacuum Spark Port: None.

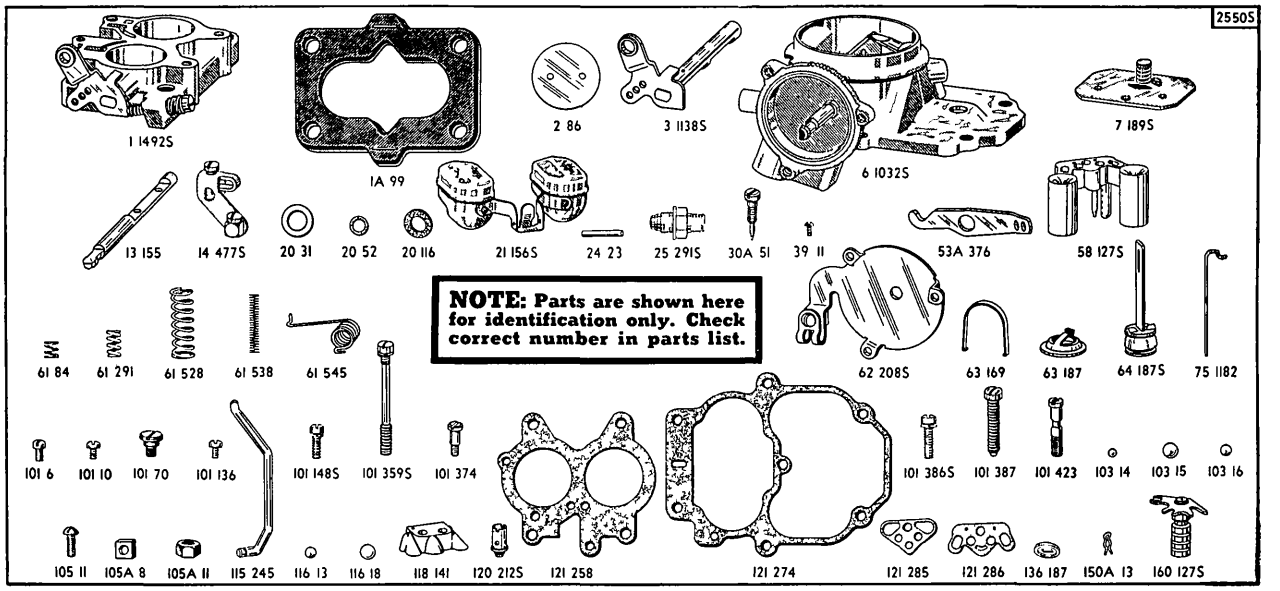
Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .017"	Ignition Timing Breaker Points to Open: 4° B. T. C. At Vibration Damper	Float Setting 9/32 Inch (Use Gauge T109-239)	Idle Adjustment Screw Setting ¼ to 1¼ Turns Open Idle Engine at 500 R.P.M.

NOTE: These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT.

CARBURETER ADJUSTMENTS



Float Adjustment: This adjustment must be made with float pin retainer removed. Hold the lip on float arm against the seated intake needle, making sure the float pin is at the bottom of its guide slots. The distance from the top surface of the body casting to the top of each float ridge (at center of float) should be 9/32 inch (gauge T109-239). If one float is lower than the other, equalize by bending the float arm. If both floats require the same correction, adjust by bending lip on float arm. The floats must not rub anywhere against the inner walls of the bowl. If necessary, bend float arms slightly to provide clearance on all sides of floats.

Pump Adjustment: Back out throttle adjusting screw so that throttle valves seat in bores of carbureter. Install pump connector rod in middle hole of throttle lever and inner hole of pump arm. The distance from the top of the bowl cover to the top of plunger shaft (not pump arm) should be 1 inch. Adjust by bending pump connector rod at lower angle (use Tool T109-213).

DODGE "V-8"

MODEL D-500

1957

WCFB Four-Bore Down-Draft Climatic® Control **Carbureters Nos. 2622S-2622SA**

CARBURETER SPECIFICATIONS

For Dodge 8 Cylinder Engine: 3.69 Inch Bore, 3.80 Inch Stroke

Dimensions Flange size 1¼ inch Four Bore—4 bolt type
Primary venturi size 11/32 inch I D
Main venturi size, 1 3/16 inch I D

Vents Inside, (5)

Gasoline Intake. Size No 42 (0935 inch) drill, in needle seat

Low Speed Jet Tube Jet size (2622S) (032 inch) diameter, (2622SA) (035 inch) diameter By pass tube in body, size (057 inch) diameter Economizer plug in body size (0465 inch) diameter Idle bleed in body size No 46 (081 inch) drill

Idle Port Upper slot type, primary length 150 inch, width 030 inch Secondary length 103 inch, width 030 inch

Idle Port Opening Primary 082 to 088 inch secondary 065 to 071 inch above top edge of valve with valve tightly closed

Lower Port Primary (for idle adjustment screw), size No 53 (0595 inch) drill Secondary (no idle adjustment screw), size No 57 (043 inch) drill.

Set Idle Adjustment Screw ¾ to 1¾ turns open For richer mixture turn screw out Do not idle engine below 650 R P M in neutral.

Main Nozzle: Installed permanently DO NOT REMOVE Anti percolating jet (4) size No 70 (028 inch) drill

Metering Rod: (Vacumeter type) see parts list for size

Metering Rod Jet. Primary Size 0945 inch diameter Sec ondary Size 067 inch diameter

Accelerating Pump Discharge jet (twin) primary side only size No 74 (0225 inch) drill Intake ball check seat, size 115 to 120 inch diameter Discharge needle seat, size No 50 (070 inch) drill Relief passage (vent) to fuel chamber size No 42 (0935 inch) drill

Choke: Carter Climatic® Control Cross Over Type set on index Butterfly type offset choke valve, primary side only Choke heat suction hole, restriction in piston housing size No 40 (098 inch) drill

Vacuum Spark Port. Horizontal slot (round end) 045 x 110 inch Top of port 022 to 032 inch above top edge of valve with valve tightly closed

CARBURETER
TRADE MARK REG U S PAT. OFF.
MARCA REGISTRADA

S S PRINTED IN U S A

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical. **LATERAL ADJUSTMENT:** With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting. Side of floats should just clear the vertical uprights of float gauge. Adjustment should be made by bending arms of floats. **VERTICAL ADJUSTMENT:** With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance between top of float and machined surface of casting must be 7/32" (gauge T109-283) for primary floats; and 9/32" (gauge T109-284) for secondary floats. Adjust by bending float arms.

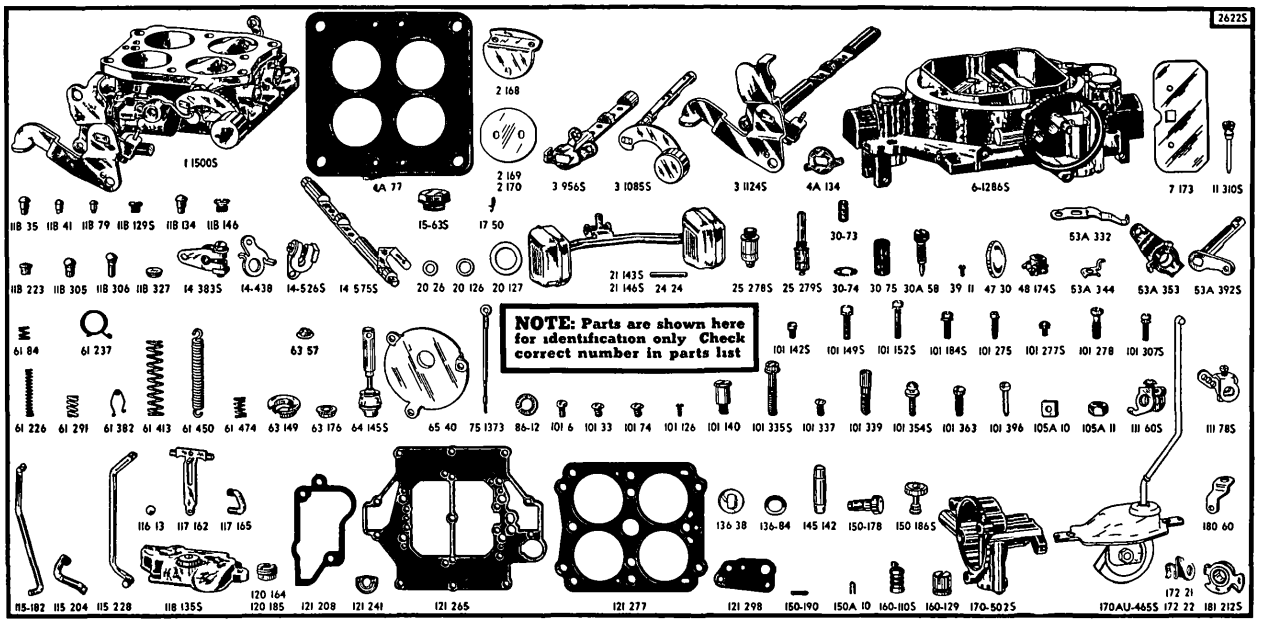
FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of floats, the distance between top of floats and bowl cover should be 23/32" for primary floats and 25/32" for secondary floats. Adjust by bending stop tabs on float bracket.

PUMP ADJUSTMENT: Install pump connector link in center hole (medium stroke) of pump arm, with ends extending toward countershaft arm. Back out throttle lever set screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at lower angle. (Use tool T109-213.)

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. 2. With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.

BOWL VAPOR VENT ADJUSTMENT: This adjustment should be made after completing pump and metering rod adjustments. Install dust cover and dust cover gasket. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter. There should be 1/16 inch (gauge T109-197) between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm.

FAST IDLE ADJUSTMENT: (a) Loosen choke lever clamp screw on choke shaft. Insert .020" feeler gauge (T109-29) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing lever towards closed position — hold in place and tighten clamp screw. (b) With choke valve tightly closed, tighten fast idle adjusting screw until there is .010" (gauge T109-200) opening between throttle valve and bore of carbureter (side opposite idle port). Be sure fast idle adjusting screw is on high step of cam while making this adjustment.



FAST IDLE ON CAR: 1350 to 1400 R.P.M.

UNLOADER ADJUSTMENT: With throttle wide open there should be 15/64" clearance between upper edge of choke valve and inner wall of air horn (gauge T109-32). Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

SECONDARY THROTTLE LEVER ADJUSTMENT: The stop lug on both primary and secondary throttle levers should contact boss on flange at the same time. To adjust bend secondary throttle operating rod at angle (use bending tool T109-213).

AUXILIARY THROTTLE LOCK-OUT ADJUSTMENT: This adjustment should be made after completing fast idle adjustment. 1. With choke valve closed, edge of hook on lockout arm should contact auxiliary throttle lever, making maximum contact of locking step on lever. 2. Open choke valve. Auxiliary throttle valve should become unlocked a few degrees before the choke reaches wide open position. Adjust by bending lockout arm.

CHOKE ADJUSTMENT (CROSS OVER TYPE) See Form 3661: 1. Loosen mounting post lock nut and turn mounting post with screw driver until index mark on disk is positioned as listed on carbureter specfication page. Hold in this position with screw driver and tighten lock nut. NOTE: Screw driver may be held in vise so that one hand may be used to support housing while tightening nut. 2. After adjustment is completed and coil housing and rod assembly and carbureter is installed on engine lift cover disk and open and close choke valve manually to see if connector rod clears sides of hole in housing cover. If rod does not clear hole in housing cover without binding replace with a new unit since connector rod cannot be bent without affecting calibration.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical. **LATERAL ADJUSTMENT:** With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting. Side of floats should just clear the vertical uprights of float gauge. Adjustment should be made by bending arms of floats. **VERTICAL ADJUSTMENT:** With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance between top of float and machined surface of casting must be 7/32" (gauge T109-283) for primary floats; and 9/32" (gauge T109-284) for secondary floats. Adjust by bending float arms.

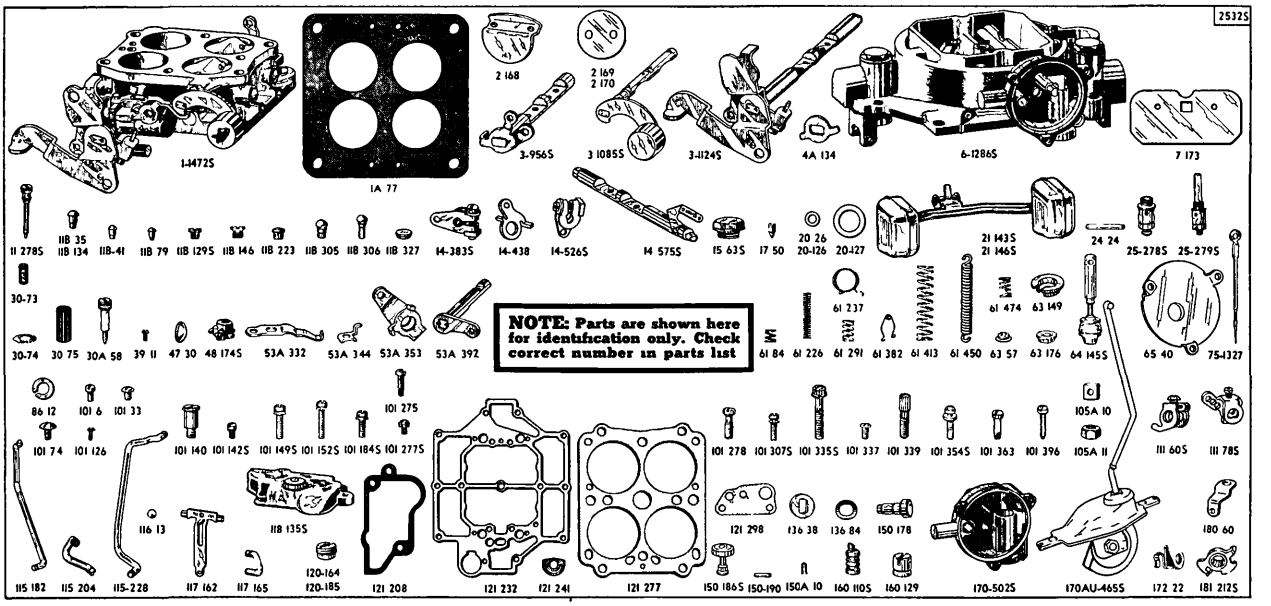
FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of floats, the distance between top of floats and bowl cover should be 23/32" for primary floats and 25/32" for secondary floats. Adjust by bending stop tabs on float bracket.

PUMP ADJUSTMENT: Install pump connector link in outer hole (long stroke) of pump arm, with ends extending toward countershaft arm. Back out throttle lever set screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at lower angle. (Use tool T109-213.)

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. 2. With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.

BOWL VAPOR VENT ADJUSTMENT: This adjustment should be made after completing pump and metering rod adjustments. Install dust cover and dust cover gasket. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter. There should be 1/16 inch (gauge T109-197) between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm.

FAST IDLE ADJUSTMENT: (a) Loosen choke lever clamp screw on choke shaft. Insert .020" feeler gauge (T109-29) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing lever towards closed position — hold in place and tighten clamp screw. (b) With choke valve tightly closed, tighten fast idle adjusting screw until there is .010" (gauge T109-200) opening between throttle valve and bore of carbureter (side opposite idle port). Be sure fast idle adjusting screw is on high step of cam while making this adjustment.



FAST IDLE ON CAR: 1350 to 1400 R.P.M.

UNLOADER ADJUSTMENT: With throttle wide open there should be 15/64" clearance between upper edge of choke valve and inner wall of air horn (gauge T109-32). Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

SECONDARY THROTTLE LEVER ADJUSTMENT: The stop lug on both primary and secondary throttle levers should contact boss on flange at the same time. To adjust bend secondary throttle operating rod at angle (use bending tool T109-213).

AUXILIARY THROTTLE LOCK-OUT ADJUSTMENT: This adjustment should be made after completing fast idle adjustment. 1. With choke valve closed, edge of hook on lockout arm should contact auxiliary throttle lever, making maximum contact of locking step on lever. 2. Open choke valve. Auxiliary throttle valve should become unlocked a few degrees before the choke reaches wide open position. Adjust by bending lockout arm.

CHOKE ADJUSTMENT (CROSS OVER TYPE) See Form 3661: 1. Loosen mounting post lock nut and turn mounting post with screw driver until index mark on disk is positioned as listed on carbureter specification page. Hold in this position with screw driver and tighten lock nut. NOTE: Screw driver may be held in vise so that one hand may be used to support housing while tightening nut. 2. After adjustment is completed and coil housing and rod assembly and carbureter is installed on engine lift cover disk and open and close choke valve manually to see if connector rod clears sides of hole in housing cover. If rod does not clear hole in housing cover without binding replace with a new unit since connector rod cannot be bent without affecting calibration.

CARTER CLIMATIC® CONTROL CROSS OVER CHOKE TYPE
(SERVICE INFORMATION AND ADJUSTMENT PROCEDURE)

NOTE: Coil housing and rod assembly may be cleaned in carbureter parts cleaner without disassembling. After cleaning rinse in solvent and blow out inside of housing with compressed air. After rinsing make sure housing revolves freely on mounting post. If disassembly is necessary for thorough cleaning, follow steps under "reassembly" to be sure coil is installed properly.

Figure A

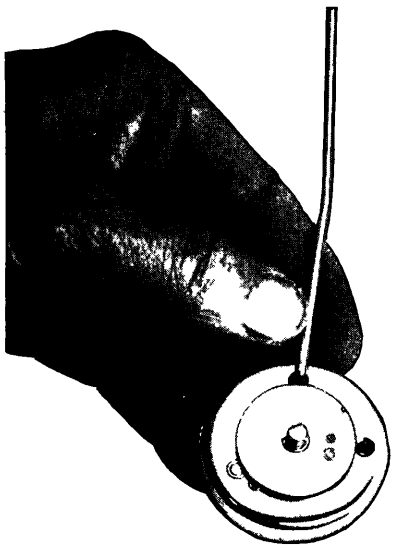

Figure B

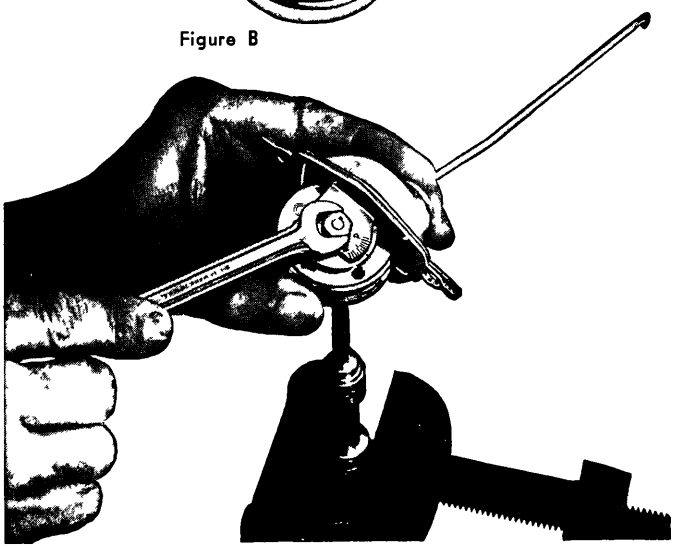

Figure C

TWO PIECE CLOSED HOUSING

REASSEMBLY:

1. Place coil mounting post in either half of coil housing.
2. Insert thermostatic coil on mounting post with hook facing clockwise. (See Fig. A.)
3. Assemble second half of housing and secure on mounting post with washer and hair pin. Be sure holes in both housings are in alignment.
4. Install connector rod with hair pin end extending through either hole toward split end of mounting post. Secure with washer and hair pin. (Eye of hair pin extending outward.)
5. Place index disk on mounting post with flat on disk aligning with flat on post and turn disk and post counter-clockwise until hook on coil engages connector rod. Index mark on disk should be just to the right (approximately 2 o'clock position) of connector rod when holding housing with rod pointing to 12 o'clock position. (See Fig. B.) If incorrectly installed turn index disk over.
6. Assemble housing cover to mounting post and install lock washer and nut.
7. Install cover disk on connector rod.

ADJUSTMENT:

1. Loosen mounting post lock nut and turn mounting post with screw driver until index mark on disk is positioned as listed on carbureter specification page. Hold in this position with screw driver and tighten lock nut. (See Fig. C.)

   NOTE: Screw driver may be held in vise so that one hand may be used to support housing while tightening nut.
2. After adjustment is completed and coil housing and rod assembly and carbureter is installed on engine lift cover disk and open and close choke valve manually to see if connector rod clears sides of hole in housing cover. If rod does not clear hole in housing cover without binding replace with a new unit since connector rod cannot be bent without effecting calibration.

ONE PIECE OPEN HOUSING

REASSEMBLY:

1. Place housing with circular edge downward and center web at 3 o'clock position. (See Fig. D.)
2. Insert thermostatic coil into housing with hook on coil in 4 o'clock position and pointing toward web of housing.
3. Insert mounting post through housing and coil with index mark toward hook on coil. (See Fig. E.)
4. Secure mounting post to housing with washer and pin spring.
5. Install cover disk on connector rod.
6. Install connector rod through housing cover into housing toward split end of mounting post. Secure with washer and pin spring. (Eye of pin spring extending outward.)
7. Assemble housing cover to mounting post with lock washer and nut. Rotate mounting post counterclockwise until hook on coil picks up connector rod and tighten nut.
8. Check positive spring action by pushing connector rod downward through housing cover.

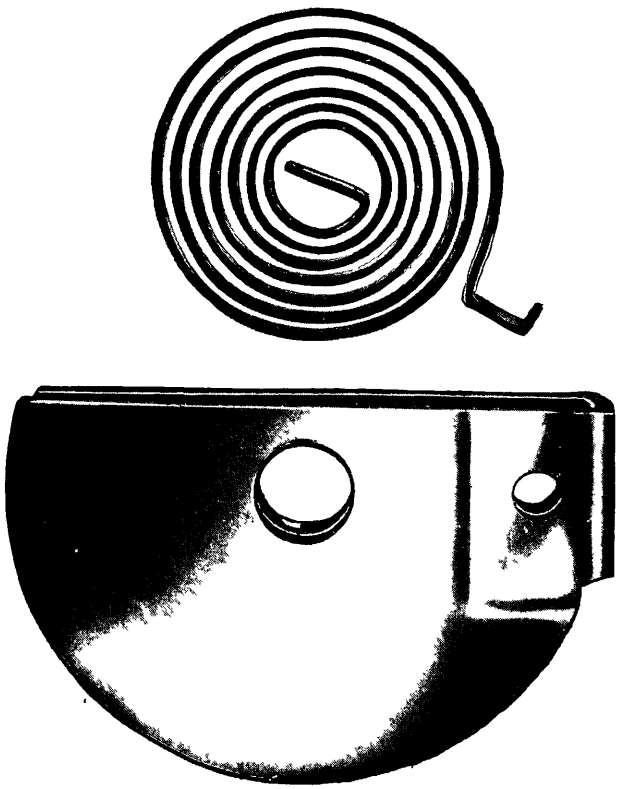

Figure D

ADJUSTMENT:

Same as two piece housing. (See Fig. C.)

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: This adjustment must be made with the bowl cover gasket and float pin retainer removed Hold the lip on float arm against the seated intake needle making sure the float pin is at the bottom of its guide slots The distance from the top surface of the body casting to the top of each float should be 7/32 inch (gauge T109 239) If one float is lower than the other, equalize by bending the float arm If both floats require the same correction adjust by bending lip on float arm The floats must not rub anywhere against the inner walls of the bowl It necessary bend float arms slightly to provide clearance on all sides of floats

PUMP ADJUSTMENT· Back out throttle adjusting screw and open choke valve so that throttle valve seats in bore of carbureter Install throttle connector rod in center hole of throttle lever The distance from the top of the bowl cover to the top of plunger shaft (not pump arm) should be 54/64 inch Adjust by bending throttle connector rod at lower angle (use Tool T109-213)

CARBURETER
TRADE MARK REG U S PAT. OFF.
MARCA REGISTRADA

FAST IDLE ADJUSTMENT Remove thermostatic coil housing assembly gasket and baffle plate With throttle adjusting screw backed out crack throttle valve and hold choke valve in fully closed position Then close throttle This will allow fast idle cam to revolve to fast idle position There should now be 016 020 inch clearance (use gauge T109 44) between throttle valve and bore of carbureter (side opposite idle port) Adjust by bending the choke connector rod at lower angle (use Tool T109 213)

Caution Be sure cam trip lever is all the way in piston housing with lug contacting cam

UNLOADER ADJUSTMENT This adjustment must be made after the fast idle adjustment Hold throttle valve wide open and close choke valve as far as possible without forcing There should now be 9/64 inch clearance (use gauge T109 34) between upper edge of choke valve and inner wall of air horn Adjust by bending arm on choke trip lever (use tool T109 214) When fast idle and unloader adjustments have been made assemble baffle plate coil housing gasket and thermostatic coil housing assembly on air horn Set Climatic® Control as specified making sure that hook on coil has picked up coil shaft lever

(Two Carbureters Per Engine)

BBS Down-Draft **Carbureters Nos. 2421S-2421SA**

CARBURETER SPECIFICATIONS

For Dodge Eight Cylinder Engine: 3.81 Inch Bore, 3.63 Inch Stroke (C-4-T8, C-4-TX8)

For Dodge Eight Cylinder Engine: 3.94 Inch Bore, 3.63 Inch Stroke (C-4-Y8, C-4-YX8, K8-L8-900, T900)

Dimensions Flange size 1½ inch S A E
Throttle bore 1-11/16 inch I D
Main venturi, 1-11/32 inch I D.

Float Setting: See adjustments

Vents: Outside none Inside, balance vent tube.

Gasoline Intake: Size No 44 (.086 inch) drill in needle seat.

Idle Tube Jet size (2421S) 0314 inch (2421SA) 0256 inch diameter Idle passage air bleed in body size No 68 (.031 inch) drill Restriction in body 0394 inch diameter

Idle Port: Upper slot type, length 143 inch; width, 030 inch.

Idle Port Opening: Top of port located .111 to .115 inch above top edge of valve, with valve tightly closed

Lower Port (For Idle Adjustment Screw): Size, 053 to 057 inch diameter

Set Idle Adjustment Screw: ¼ to 1 turn open For richer mixture turn screw out Idle engine between 450-500 r p m

Main Metering Jet: Calibrated to flow 406 cc per minute (Do not gauge for size, if in doubt, replace with new part)

Main Vent Tube: Side holes, 6—0354 inch diameter Bleed in top of tube 0315 inch diameter.

Step-Up Rod: (Vacuum operated) See parts list for size

Accelerating Pump: Pump intake passage, ball check seat, size 110 to 120 inch diameter
Pump discharge passage, restriction (under ball check), size 110 to 120 inch diameter in body
Pump (discharge) jet, size 0393 inch drill

Pump Adjustment: See adjustments

Choke: Manual—butterfly type with poppet valve

Vacuum Spark Port: None

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .017"	Ignition Timing Breaker Points to Open: 4° B.T.D.C. At Vibration Damper	Float Setting (See Adjustments)	Idle Adjustment Screw Setting ¼ t 1 Turn Open Idle engine at 450 to 500 R.P.M.

NOTE: These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT This adjustment must be made with the bowl cover gasket and float pin retainer removed Hold the lip on float arm against the seated intake needle making sure the float pin is at the bottom of its guide slots The distance from the top surface of the body casting to the top of each float should be 9/32 inch (gauge T109-239) If one float is lower than the other equalize by bending the float arm If both floats require the same correction, adjust by bending lip on float arm The float must not rub any where against the inner walls of the bowl If necessary bend float arms slightly to provide clearance on all sides of floats

PUMP ADJUSTMENT Back out throttle adjusting screw and open choke valve so that throttle valve seats in bore of carbureter Install throttle connector rod in center hole (medium stroke) of throttle lever The distance from the top of the bowl cover to the top of plunger shaft (not pump arm) should be 55/64 inch Adjust by bending pump connector rod at lower angle (use tool T109-213)

CARBURETER
TRADE MARK REG. U. S. PAT OFF.
MARCA REGISTRADA

FAST IDLE ADJUSTMENT. Remove thermostatic coil housing assembly, gasket and baffle plate With throttle adjusting screw backed out, crack throttle valve and hold choke valve in fully closed position Then close throttle This will allow fast idle cam to revolve to fast idle position There should now be 022- 026 inch clearance (use gauge T109-189) between throttle valve and bore of carbureter (side opposite idle port) Adjust by bending the choke connector rod at lower angle (use tool T109-213)

UNLOADER ADJUSTMENT This adjustment must be made after the fast idle adjustment Hold throttle valve wide open and close choke valve as far as possible without forcing There should now be 9/64 inch clearance (use gauge T109-34) between upper edge of choke valve and inner wall of air horn Adjust by bending arm on choke trip lever (use tool T109-214) When fast idle and unloader adjustments have been made, assemble baffle plate, coil housing gasket and thermostatic coil housing assembly on air horn Set Climatic® Control as specified making sure that hook on coil has picked up coil shaft lever

B-B DOWN-DRAFT CARBURETER—**MODELS E7T1-E7T2**

CARBURETER SPECIFICATIONS

Dimensions: Flange size, 1 1/2 inch.
Throttle bore, 1-11/16 inch.
Main venturi, 1-11/32 inch I. D

Float Setting: When using a solid needle, the distance from the top of float should be 5/64 inch (gauge T109-50), plus or minus 1/64 inch, below top surface of carbureter body casting Float setting for spring loaded needle and seat assembly See footnote * on page two

Vents: Outside none Inside balance vent tube 218 inch diameter

Gasoline Intake Needle: Triangular, horizontal No. 44 (086 inch) drill in needle seat

Idle Orifice Tube: Jet size 0276 inch drill. Idle passage air bleed in air horn, size 0465 inch diameter Restriction in body, size 0452 inch diameter.

Idle Ports: Upper port Slot type length 149 inch, width 030 inch Top of port located 118 to .122 inch above top edge of valve Lower port size 053 to 057 inch drill (For idle adjustment screw)

Set Idle Adjustment Screw: 1/2 to 1 1/2 turns open. For richer mixture turn screw out Idle engine between 450-500 r p m

Main Metering Jet: Calibrated to flow 315 to 319 cc per minute (Do not gauge for size If in doubt replace with new part)

Main Vent: Through diffuser (air bleed inside bowl). Size 0315 inch drill.

Main Vent Tube: Side Holes 4—0354 inch diameter.

Step-Up Jet: Power orifice 0413 inch drill

Accelerating Pump: Type—delayed action, seasonal adustment Stroke—Summer setting (inner hole, short stroke). Intermediate setting (center hole) Winter setting (outer hole, long stroke) Pump intake passage ball check seat, size .115 to 120 inch diameter in body Pump discharge passage· Restriction (under ball check) size 062 to 065 inch diameter in body Pump (discharge) jet size, 0374 inch drill.

Pump Adjustment: 26/64 inch plunger travel—full throttle position medium stroke Use gauge T109-117S.

Choke: Offset butterfly type (with poppet valve)

Vacuum Spark Port: Slot (round end) type; size 040 by 110 inch Top of port 052 to 058 inch above top edge of valve

Motor Tune-Up—Be Accurate!

CAUTION· Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjustiag carbureter.

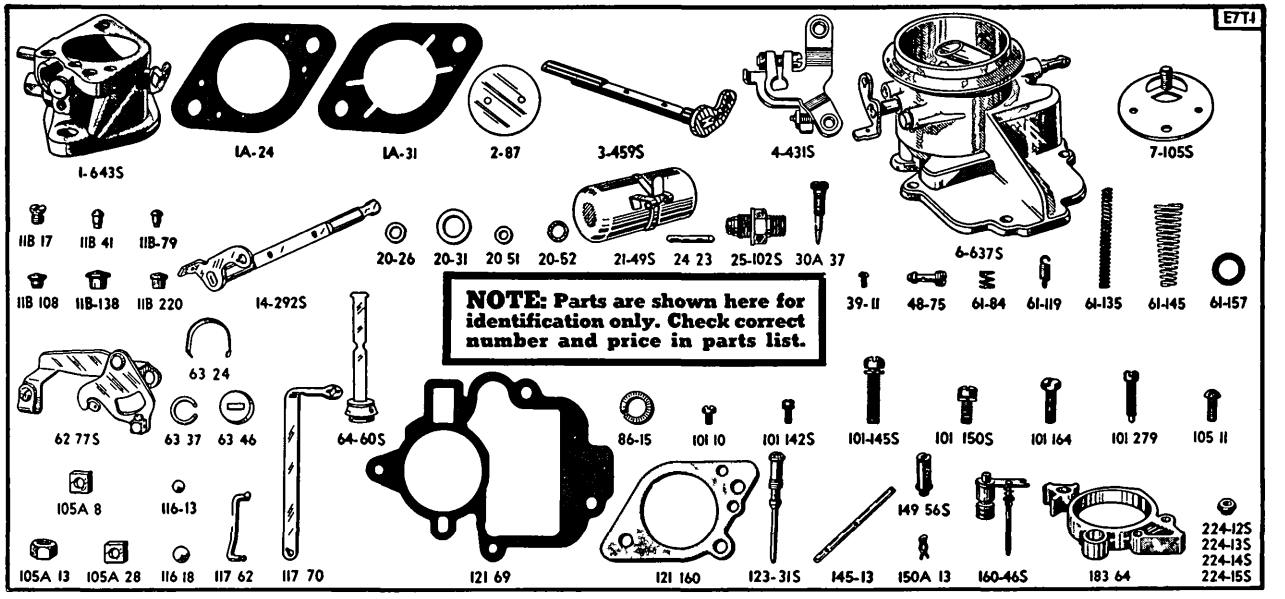
CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service, check float level Wear on lip of float lever will raise float level Before adjusting float, be sure float lever pin is firmly seated Reset float level by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level Bend vertical lip of float only

If motor stalls while idling, set throttle lever adjusting screw so motor runs between 450-500 r p m Then set idle adjustment screw to specifications If these adjustments do not correct the trouble, remove idle orifice tube and plug assembly Clean tube passages with compressed air



If acceleration is not satisfactory, remove pump jet and clean with compressed air However, it is usually advisable to replace the pump jet, as its cost is nominal All jets must be seated gasoline tight Poor acceleration may be due to damaged or worn plunger leather in accelerating pump, sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather

Correct air fuel ratio is provided by a "balance tube" in the air horn The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner Should the cleaner become clogged, the capacity will be reduced but the air-fuel mixture ratio will not be changed

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with tool No T109-43 main vent tube can be removed and a new tube inserted with tool No T109-195 Care must be exercised in inserting new tube which must seat tightly Use new rivet to complete the installation

Pump Adjustment Remove air horn assembly, back out throttle adjustment screw, and place pump operating link in center hole of throttle shaft arm Place gauge T109-117S on edge of bowl cover so that lip of gauge extends over top of plunger shaft Turn knurled nut of gauge until lip contacts plunger shaft at closed and wide open throttle positions Difference in readings obtained at closed and wide open throttle positions should be ' 26 (26/64") plunger travel Adjustments can be made by bending horizontal portion of pump lifter link

Pump stroke adjustable for high or low temperature Set to long stroke for cold weather, short stroke for hot weather driving

Dodge Truck—1950-1958—Nos. E7T1-E7T2

BB DOWN-DRAFT CARBURETER WITH GOVERNOR—**E7S1**

CARBURETER SPECIFICATIONS

Six Cylinder Engine: 3¼ Inch Bore, 4⅝ Inch Stroke

Dimensions: Flange size, 1½ inch S. A. E.
Throttle bore, 1-11/16 inch (42.86 mm).
Main venturi, 1-11/32 inch (3.413 mm).

Float Setting: Top of float 5/64 inch (1.98 mm) plus or minus 1/64 inch (.397 mm) below top surface of carbureter body casting.

Vents: Outside: none. Inside: balance vent tube .218 inch (5.56 mm) inside diameter.

Gasoline Intake Needle: Triangular, horizontal, needle seat size No. 44 (2.18 mm) drill.

Idle Orifice Tube: Jet size .0276 inch (.70 mm).
Idle passage air bleed (in air horn), size .059 inch (1.50 mm).
Idle restriction in body, size .055 inch (1.397 mm).

Idle Ports: Upper port: slot type. Length, .128 inch (3.251 mm). Width, .027 inch (.686 mm).
Top of port .104 inch (2.642 mm) to .110 inch (2.794 mm) above top edge of valve, in slot (early production); .096 inch (2.388 mm) to .100 inch (2.540 mm) above top edge of valve, in slot (late production).
Lower port size: .053 to .057 inch (1.35 to 1.45 mm) diameter (For idle adjustment screw).

Set Idle Adjustment: ½ to 1½ turns open. For richer mixture turn screw out. Do not idle engine below 450 to 500 r.p.m. motor speed.

Vacuum Spark Port: None.

Main Metering Jet: Calibrated to flow 328 to 332 cc per minute. Do not gauge for size. If in doubt, replace with new part.

Main Vent: Fuel chamber to vent tube well (in air horn), size .063 inch (1.60 mm) diameter. In vent tube plug, size .0433 (1.10 mm) diameter.

Main Vent Tube: Side holes: 1—.0354 (.90 mm) diameter, 3/32 inch (2.381 mm) from end.
1—.0354 inch (.90 mm) diameter, ⅛ inch (3.175 mm) from end.
1—.0236 inch (.60 mm) diameter, ½ inch (12.70 mm) from end.
1—.0236 inch (.60 mm) diameter, 17/32 inch (13.49 mm) from end.
1—.0157 inch (.40 mm) diameter, 1-15/32 inch (37.31 mm) from end.

Step-Up Jet: Size, .0492 inch (1.25 mm) diameter.

Accelerating Pump: Type, vacuum operated. Stroke, non-adjustable. Pump intake passage ball check seat, size .107 to .112 inch (2.72 to 2.845 mm) diameter.
Pump discharge passage, ball check restriction size, .062 to .065 inch (1.58 to 1.65 mm) diameter.
Pump discharge jet, size .0315 inch (.80 mm) diameter.

Choke: Offset butterfly type, with poppet valve.

CARBURETER ADJUSTMENTS

Correct float adjustment is important and should be made in the following way:

Place float gauge (No. T109-50) across the carbureter body. Press float lever down to hold float pin against the bottom of the slot in the body casting. Floats should just clear the projections on the gauge. If adjustment is necessary, bend lip on float lever toward intake needle to lower level or away from the needle to raise the float level.

If motor stalls while idling, set throttle lever adjusting screw so motor runs between 450 and 500 R.P.M. Then set idle adjustment screw ½ to 1½ turns open from closed position. If a vacuum gauge is available, adjust to highest steady gauge reading.

Accelerating pump is actuated by the intake manifold vacuum and no adjustment is necessary. However, be sure the bowl cover gasket and flange gasket seal to prevent any air leaks to the pump vacuum passages.

If engine misses when load is suddenly increased, remove pump jet and clean with compressed air. However, it is usually advisable to replace the pump jet, as its cost is nominal. (All jets must be seated gasoline tight). This condition may also be due to damaged or worn plunger leather in accelerating pump cylinder or discharge check in discharge passage. If plunger is removed from cylinder, use care when installing to avoid damage to plunger leather.

Correct air fuel ratio is provided by a "balance tube" in the air horn. The balance tube should be checked each time the carbureter is serviced to see that the passage is open. The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner. Should the cleaner become clogged, the capacity will be reduced but the air-fuel mixture ratio will not be changed.

CARBURETER ADJUSTMENTS

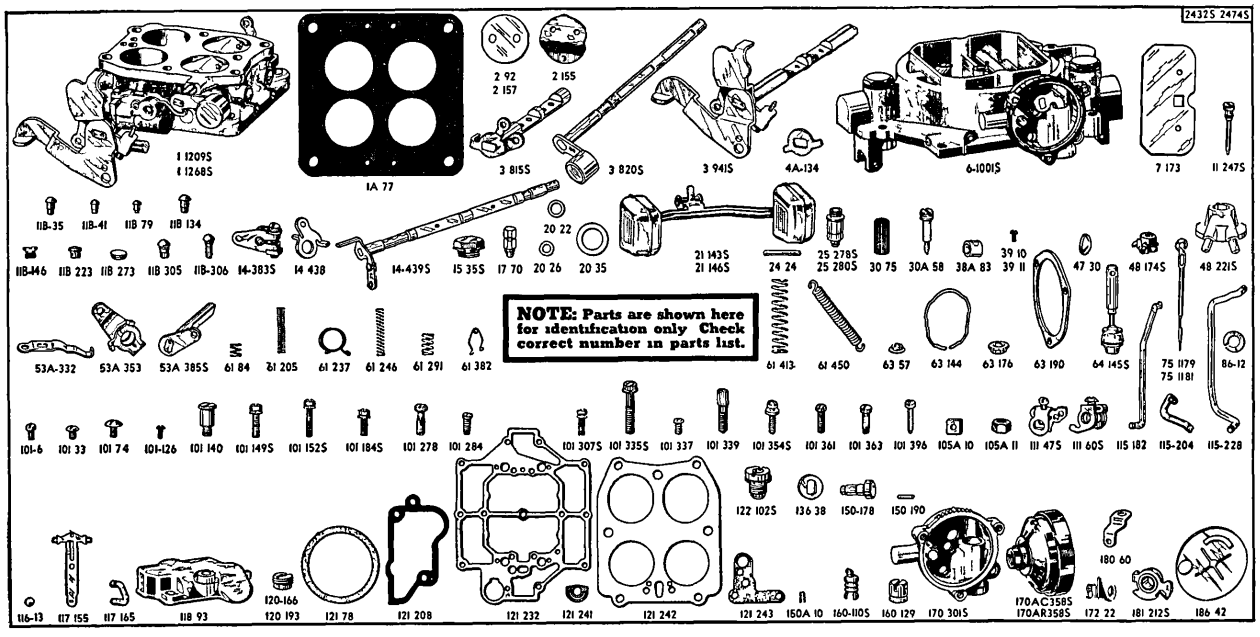
FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical. LATERAL ADJUSTMENT: With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting. Side of floats should just clear the vertical uprights of float gauge. Adjustment should be made by bending arms of floats. VERTICAL ADJUSTMENT: With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance between top of float and machined surface of casting must be 1/8" (gauge T109-232) for primary floats; and 3/16" (gauge T109-222) for secondary floats. Adjust by bending float arms.

FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of floats, the distance between top of floats and bowl cover should be 5/8" for primary floats and 11/16" for secondary floats. Adjust by bending stop tabs on float bracket.

PUMP ADJUSTMENT: Install pump connector link in outer hole (long stroke) of pump arm, with ends extending toward countershaft arm. Back out throttle lever set screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod (Early) at upper angle, (Late) at lower angle. (Use tool T109-213.)

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. 2. With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.

FAST IDLE ADJUSTMENT: (a) Loosen choke lever clamp screw on choke shaft. Insert .020" feeler gauge (T109-29) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing lever towards closed position—hold in place and tighten clamp screw. (b) With choke valve tightly closed, tighten fast idle adjusting screw until there is .012" (gauge T109-200) opening between throttle valve and bore of carbureter (side opposite idle port). Be sure fast idle adjusting screw is on high step of cam while making this adjustment.



UNLOADER ADJUSTMENT: With throttle wide open there should be 3/16" clearance between upper edge of choke valve and inner wall of air horn (gauge T109-28). Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

AUXILIARY THROTTLE VALVE ADJUSTMENT: (a) Disconnect secondary throttle operating rod. (b) Adjust stop lug on secondary throttle lever (use bending tool T109-214) until there is 27/64" clearance (gauge T109-242) between lower edge of auxiliary throttle valve and bore, when lug is against stop on flange.

SECONDARY THROTTLE LEVER ADJUSTMENT: The stop lug on both primary and secondary throttle levers should contact boss on flange at the same time. To adjust bend secondary throttle operating rod at angle (use bending tool T109-213). NOTE: Secondary throttle valves will be a few degrees from wide open position.

AUXILIARY THROTTLE LOCK-OUT ADJUSTMENT: This adjustment should be made after completing fast idle adjustment. 1. With choke valve closed, edge of hook on lock-out arm should contact auxiliary throttle lever, making maximum contact of locking step on lever. 2. Open choke valve. Auxiliary throttle valve should become unlocked a few degrees before the choke reaches wide open position. Adjust by bending lock-out arm.

WCFB Four-Bore Down-Draft Climatic® Control **Carbureters Nos. 2443S-2443SA**

CARBURETER SPECIFICATIONS

For Dodge 8 Cylinder Engine: 3.63 Inch Bore, 3.80 Inch Stroke

Dimensions Flange size 1¼ inch Four Bore—4 bolt type
Primary venturi size 11/32 inch I D
Main venturi size 1 3/16 inch I D

Vents 5 inside 4 outside

Gasoline Intake: Size No 42 (0935 inch) drill; in needle seat

Low Speed Jet Tube: Jet size 035 inch diameter By-pass in body size (057 inch) diameter Economizer plug in body size No 56 (0465 inch) drill Idle bleed, in body, size No 46 (081 inch) drill

Idle Port Upper slot type, primary length 140 inch, width 030 nch Secondary, length 103 inch, width 030 inch

Idle Port Opening: Primary 092 to 098 inch, secondary 065 to 071 inch above top edge of valve with valve tightly closed

Lower Port: Primary (for idle adjustment screw), size No 55 (052 inch) drill Secondary (no idle adjustment screw), size No 57 (043 inch) drill

Set Idle Adjustment Screw: ¾ to 1¾ turns open For richer mixture turn screw out Do not idle engine below 450 to 500 R P M in neutral

Main Nozzle: Installed permanently DO NOT REMOVE. Anti-percolating jet (4) size No 70 (028 inch) drill

Metering Rod: Primary; Economy step 077 inch diameter Middle step tapers to 068 inch diameter Power step 045 inch diameter Secondary, none

Metering Rod Jet: Primary: Size 0995 inch diameter. Secondary Size 067 inch diameter

Accelerating Pump: Discharge jet (twin) primary side only, size No 74 (0225 inch) drill Intake ball check seat, size 115 to 120 inch diameter Discharge needle seat, size No 50 (070 inch) drill Relief passage (vent) to fuel chamber size No 42 (0935 inch) drill

Choke. Carter Climatic® Control set on index Butterfly type offset choke valve, primary side only Choke heat suction hole restriction in piston housing size No 47 (0785 inch) drill

Vacuum Spark Port: Horizontal slot (round end) 045 x 110 inch Top of port 022 to 032 inch above top edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical. **LATERAL ADJUSTMENT:** With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting. Side of floats should just clear the vertical uprights of float gauge. Adjustment should be made by bending arms of floats. **VERTICAL ADJUSTMENT:** With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance between top of float and machined surface of casting must be 7/32" (gauge T109-283) for primary floats; and 9/32" (gauge T109-284) for secondary floats. Adjust by bending float arms.

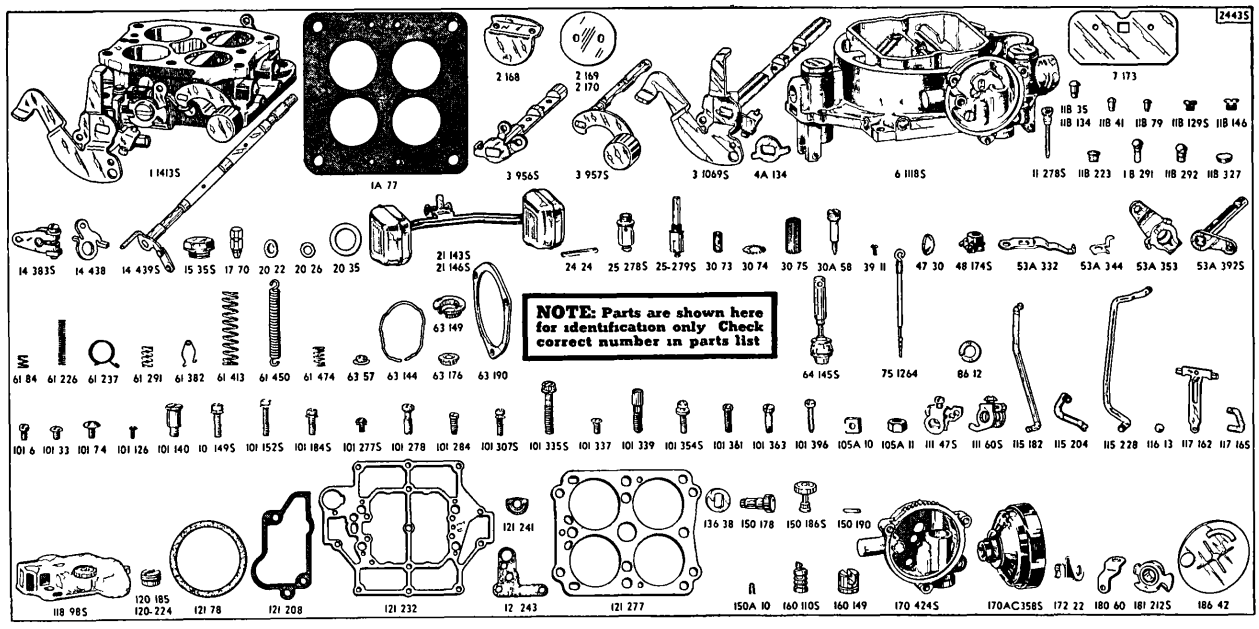
FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of floats, the distance between top of floats and bowl cover should be 23/32" for primary floats and 25/32" for secondary floats. Adjust by bending stop tabs on float bracket.

PUMP ADJUSTMENT: Install pump connector link in outer hole (long stroke) of pump arm, with ends extending toward countershaft arm. Back out throttle lever set screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod (early) at upper angle, (late) at lower angle. (Use tool T109-213.)

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. 2. With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.

BOWL VAPOR VENT ADJUSTMENT: This adjustment should be made after completing pump and metering rod adjustments. Install dust cover and dust cover gasket. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter. There should be 1/16 inch (gauge T109-197) between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm.

FAST IDLE ADJUSTMENT: (a) Loosen choke lever clamp screw on choke shaft. Insert .020" feeler gauge (T109-29) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing lever towards closed position — hold in place and tighten clamp screw. (b) With choke valve tightly closed, tighten fast idle adjusting screw until there is .012" (gauge T109-200) opening between throttle valve and bore of carbureter (side opposite idle port). Be sure fast idle adjusting screw is on high step of cam while making this adjustment.



FAST IDLE ON CAR: 1300-1350 R.P.M.

UNLOADER ADJUSTMENT: With throttle wide open there should be 11/64" clearance between upper edge of choke valve and inner wall of air horn (gauge T109-166). Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

SECONDARY THROTTLE LEVER ADJUSTMENT: The stop lug on both primary and secondary throttle levers should contact boss on flange at the same time. To adjust bend secondary throttle operating rod at angle (use bending tool T109-213).

AUXILIARY THROTTLE LOCK-OUT ADJUSTMENT: This adjustment should be made after completing fast idle adjustment. 1. With choke valve closed, edge of hook on lockout arm should contact auxiliary throttle lever, making maximum contact of locking step on lever. 2. Open choke valve. Auxiliary throttle valve should become unlocked a few degrees before the choke reaches wide open position. Adjust by bending lockout arm.

CARBURETER ADJUSTMENTS

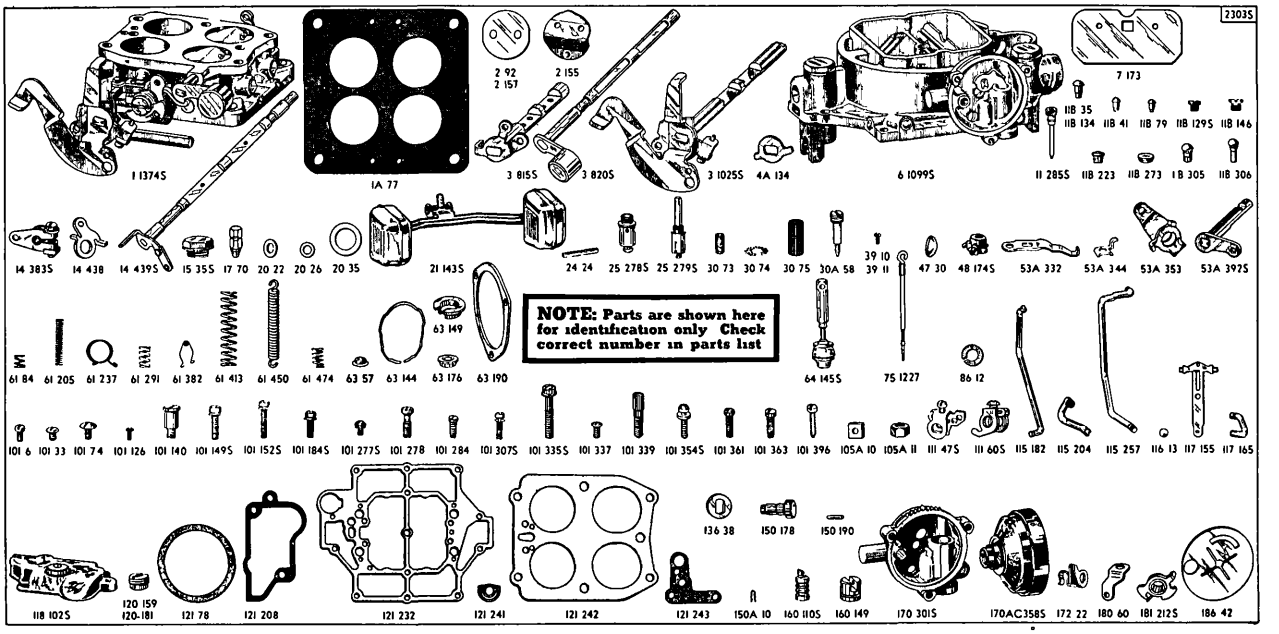
FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical. LATERAL ADJUSTMENT: With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting. Side of floats should just clear the vertical uprights of float gauge. Adjustment should be made by bending arms of floats. VERTICAL ADJUSTMENT: With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance between top of float and machined surface of casting must be 7/32" (gauge T109-283) for primary floats; and 9/32" (gauge T109-284) for secondary floats. Adjust by bending float arms.

FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of floats, the distance between top of floats and bowl cover should be 23/32" for primary floats and 25/32" for secondary floats. Adjust by bending stop tabs on float bracket.

PUMP ADJUSTMENT: Install pump connector link in outer hole (long stroke) of pump arm, with ends extending toward countershaft arm. Back out throttle lever set screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at upper angle. (Use tool T109-213.)

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. 2. With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.

BOWL VAPOR VENT ADJUSTMENT: This adjustment should be made after completing pump and metering rod adjustments. Install dust cover and dust cover gasket. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter. There should be 1/16 inch (gauge T109-197) between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm.



FAST IDLE ADJUSTMENT: (a) Loosen choke lever clamp screw on choke shaft. Insert .020" feeler gauge (T109-29) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing lever towards closed position — hold in place and tighten clamp screw. (b) With choke valve tightly closed, tighten fast idle adjusting screw until there is .012" (gauge T109-200) opening between throttle valve and bore of carbureter (side opposite idle port). Be sure fast idle adjusting screw is on high step of cam while making this adjustment.

UNLOADER ADJUSTMENT: With throttle wide open there should be 11/64" clearance between upper edge of choke valve and inner wall of air horn (gauge T109-166). Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

AUXILIARY THROTTLE VALVE ADJUSTMENT: (a) Disconnect secondary throttle operating rod. (b) Adjust stop lug on secondary throttle lever (use bending tool T109-214) until there is 27/64" clearance (gauge T109-242) between lower edge of auxiliary throttle valve and bore, when lug is against stop on flange.

SECONDARY THROTTLE LEVER ADJUSTMENT: The stop lug on both primary and secondary throttle levers should contact boss on flange at the same time. To adjust bend secondary throttle operating rod at angle (use bending tool T109-213).

AUXILIARY THROTTLE LOCK-OUT ADJUSTMENT: This adjustment should be made after completing fast idle adjustment. 1. With choke valve closed, edge of hook on lockout arm should contact auxiliary throttle lever, making maximum contact of locking step on lever. 2. Open choke valve. Auxiliary throttle valve should become unlocked a few degrees before the choke reaches wide open position. Adjust by bending lockout arm.

Dodge "V-8"—1956—Carbureters Nos. 2303S-2303SA-2303SB

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT This adjustment must be made with bowl cover gasket and float pin retainer removed Hold the lip on float arm against the seated intake needle, making sure the float pin is at the bottom of its guide slots The distance from the top surface of the body casting to the top of each float should be 7/32 inch (gauge T109-239) If one float is lower than the other, equalize by bending the float arm If both floats require the same correction adjust by bending lip on float arm The floats must not rub anywhere against the inner walls of the bowl If necessary, bend float arms slightly to provide clearance on all sides of floats.

PUMP ADJUSTMENT Back out throttle adjusting screw so that throttle valves seat in bores of carbureter Install pump connector rod in middle hole of throttle lever and innner hole of pump arm The distance from the top of the bowl cover to the top of plunger shaft (not pump arm) should be 1 inch Adjust by bending pump connector rod at lower angle (use Tool T109-213)

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT This adjustment must be made with the bowl cover gasket and float pin retainer removed Place a 050 inch feeler gauge (T109-226) between lip of float and intake pin Hold the lip on float arm against the seated intake needle fully compressing the intake needle spring The distance from the top surface of the body casting to the top of the float should be 5/64 inch (gauge T109-50) To adjust bend lip on float arm

PUMP ADJUSTMENT Remove air horn assembly, back out throttle adjustment screw and be sure pump operating link is in center hole of throttle shaft arm Place Universal pump travel gauge T109-117S on edge of bowl cover so that lip of gauge extends over top of plunger shaft With throttle valve seated turn knurled nut of gauge until lip contacts top of plunger shaft Take reading indicated on gauge Repeat with throttle valve wide open and plunger pushed to bottom of cylinder The difference in reading obtained should be '26" (26/64 inch) Adjust by bending horizontal portion of pump lifter link

Pump stroke adjustable for high or low temperatures Set to longest stroke for cold weather, shorter stroke for hot weather driving

RECOMMENDED PROCEDURE FOR SETTING IDLE

1 Back out idle speed screw on rear carb (fully closed throttle)
2 Adjust idle speed screw on front carb to give 450 r p m
3 Adjust idle mixture on front carb to best operation and readjust idle speed if necessary
4 Back out idle speed screw on front carb two full turns (or whatever is necessary to insure closed throttle)
5. Adjust idle speed screw on rear carb to give 450 r p m
6 Adjust idle mixture screw on rear carb to give best operation and readjust idle speed if necessary
7 Turn in idle speed screw on front carbureter same number of turns as in step No 4

This should result in balancing the two carbureters Any further adjustment to idle speed or mixture should be made by turning the screw the same amount on each carbureter

Dodge Truck—1953-1956—Carbureters Models E9K1-E9Y1

BB Down-Draft Carbureters—**Models E7R1-E9J1**

CARBURETER SPECIFICATIONS

For Dodge Truck Six Cylinder Engine 3¼ Inch Bore 4⅝ Inch Stroke

Dimensions Flange size 1½ inch
Throttle bore 1 11/16 inch
Main venturi 1 11/32 inch I D

Float Setting When using a solid needle the distance from the top of float should be 5/64 inch (gauge T109 50) plus or minus 1/64 inch below top surface of carbureter body casting Float setting for spring loaded needle and seat assembly See footnote (†) on page two

Vents Outside none Inside balance vent tube 218 inch diameter

Gasoline Intake Needle Triangular horizontal No 44 (086 inch) drill in needle seat

Idle Orifice Tube Jet size 0276 inch drill Idle passage air bleed in air horn size 0465 inch diameter Restriction in body size 0452 inch diameter

Idle Ports Upper port Slot type length 149 inch width 030 inch Top of port located 118 to 122 inch above top edge of valve Lower port size 053 to 057 inch drill (For idle adjustment screw)

Set Idle Adjustment Screw ½ to 1½ turns open For richer mixture turn screw out Idle engine between 450 500 r p m

Main Metering Jet Calibrated to flow 315 to 319 cc per minute (Do not gauge for size If in doubt replace with new part)

Main Vent Through diffuser (air bleed inside bowl) Size 0315 inch drill

Main Vent Tube Side Holes 4—0354 inch diameter

Step-Up Jet Size (E7R1) 0413 inch (E9J1) 037 inch diameter

Accelerating Pump Type—delayed action seasonal adjustment Stroke—Summer setting (inner hole short stroke) Intermediate setting (center hole) Winter setting (outer hole long stroke) Pump intake passage ball check seat size 115 to 120 inch diameter in body Pump discharge passage Restriction (under ball check) size 062 to 065 inch diameter in body Pump (discharge) jet size 0374 inch drill

Pump Adjustment 26/64 inch plunger travel—full throttle position medium stroke Use gauge T109 117S

Choke Offset butterfly type (with poppet valve)

Slow Closing Throttle Dash pot with discharge (by pass) size 0197 inch drill through plunger shaft

Vacuum Spark Port Slot (round end) type size 040 by 110 inch Bottom of port 012 to 018 inch above top edge of valve

Motor Tune-Up—Be Accurate!

CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter

Spark Plug Gap	Set Breaker Points	Ignition Timing Breaker Points to Open	Set Valves (Hot)	Float Setting (Use Gauge T109-50)	Idle Adjustment Screw Setting
035"	020"	1953—T D C 1954 56—2° B T D C	Intake 010" Exhaust 014"	Solid Needle—5/64 Inch Spring Loaded Needle See Footnote on Page 2	½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service check float level Wear on lip of float lever will raise float level Before adjusting float be sure float lever pin is firmly seated Reset float level by bending lip of float lever away from needle to raise level or bend lip toward needle to lower float level Bend vertical lip of float only

If motor stalls while idling set throttle lever adjusting screw so motor runs between 450 500 r p m Then set idle adjustment screw to specifications If these adjustments do not correct the trouble remove idle orifice tube and plug assembly Clean tube and passages with compressed air

If acceleration is not satisfactory, remove pump jet and clean with compressed air However it is usually advisable to replace the pump jet as its cost is nominal All jets must be seated gasoline tight Poor acceleration may be due to damaged or worn plunger leather in accelerating pump sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage If plunger is removed from cylinder use care in installing to avoid damage to plunger leather

Correct air fuel ratio is provided by a balance tube in the air horn The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type size or condition of air cleaner Should the cleaner become clogged the capacity will be reduced but the air fuel mixture ratio will not be changed

CARBURETER
TRADE MARK REG U S PAT OFF
MARCA REGISTRADA

PRINTED IN U S A

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with tool No T109 43 main vent tube can be removed and a new tube inserted with tool No T109 195 Care must be exercised in inserting new tube which must seat tightly Use new rivet to complete the installation

Pump Adjustment Remove air horn assembly back out throttle adjustment screw and be sure pump operating link is in center hole of throttle shaft arm Place universal pump travel gauge T109 117S on edge of bowl cover so that lip of gauge extends over top of plunger shaft Turn knurled nut of gauge until lip contacts top of plunger shaft with throttle valve seated Take reading indicated on gauge Repeat with throttle valve wide open and plunger pushed to bottom of cylinder The difference in reading obtained should be 26 (26/64") plunger travel

Adjust by bending horizontal portion of pump lifter link Pump stroke adjustable for high or low temperatures Set to longest stroke for cold weather shorter stroke for hot weather driving

Dash-Pot Adjustment Engines operating in connection with fluid couplings frequently tend to stall during rapid deceleration unless the throttle closes slowly Slow throttle movement is necessary only during the last part of the closing The dash-pot or decelerating pump acts as a snubber to the throttle allowing fast movement to almost closed position, then slow closing from that point to the idle position

When the throttle is released, the throttle valve closes rapidly until throttle shaft arm contacts the dash-pot pick up arm Then the dash pot plunger must be pushed to the bottom of the cylinder before the throttle can close A ball check located in the lower end of the plunger shaft seals the larger upper opening and the gasoline must leave the cylinder through the small metered hole in lower part of the shaft

This reduces the rate at which plunger can be forced to the bottom of the cylinder making the last part of the throttle closing very slow **The adjusting screw** (in top of bowl cover) **should be opened five full turns from closed position** for average conditions Under extreme driving conditions greater openings may be necessary although extreme dash pot action will affect gear changes and not enough action will allow engine to stall

Be sure plunger leather is soft and pliable and effects a good seal against the cylinder wall

(Two Carbureters Per Engine)

BBS Down-Draft **Carbureter No. 2227S**

CARBURETER SPECIFICATIONS

For Dodge Eight Cylinder Engine: 3.81 Inch Bore, 3.63 Inch Stroke

Dimensions: Flange size, 1½ inch S A E
Throttle bore 1-11/16 inch I D
Main venturi, 1-11/32 inch I D

Float Setting: See adjustments

Vents. Outside, none Inside balance vent tube

Gasoline Intake: Size No 44 (.086 inch) drill in needle seat

Idle Tube: Jet, size .0315 inch diameter Idle passage air bleed in body size No 68 (.031 inch) drill Restriction in body, .0394 inch diameter

Idle Port: Upper slot type length .143 inch, width .030 inch

Idle Port Opening: Top of port located .111 to .115 inch above top edge of valve, with valve tightly closed

Lower Port (For Idle Adjustment Screw): Size .053 to .057 inch diameter

Set Idle Adjustment Screw: ¼ to 1 turn open For richer mixture turn screw out Idle engine between 450-500 r p m

Main Metering Jet: Calibrated to flow 453 cc per minute (Do not gauge for size if in doubt, replace with new part)

Main Vent Tube: Side holes 6—.0354 inch diameter Bleed in top of tube .0315 inch diameter

Step-Up Rod: (Vacuum operated) .024 inch diameter

Accelerating Pump: Pump intake passage ball check seat, size .110 to .120 inch diameter
Pump discharge passage, restriction (under ball check), size .110 to .120 inch diameter in body
Pump (discharge) jet, size .0393 inch drill

Pump Adjustment: See adjustments

Choke: Manual—butterfly type with poppet valve

Vacuum Spark Port: None

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .017"	Ignition Timing Breaker Points to Open: 4° B.T.D.C. At Vibration Damper	Float Setting (See Adjustments)	Idle Adjustment Screw Setting ¼ to 1 Turn Open Idle engine at 450 to 500 R.P.M.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT. This adjustment must be made with the bowl cover gasket and float pin retainer removed Hold the lip on float arm against the seated intake needle, making sure the float pin is at the bottom of its guide slots The distance from the top surface of the body casting to the top of each float should be 9/32 inch (gauge T109-239) If one float is lower than the other, equalize by bending the float arm If both floats require the same correction, adjust by bending lip on float arm The floats must not rub anywhere against the inner walls of the bowl If necessary, bend float arms slightly to provide clearance on all sides of floats

PUMP ADJUSTMENT Back out throttle adjusting screw and open choke valve so that throttle valve seats in bore of carbureter Install throttle connector rod in center hole (medium stroke) of throttle lever The distance from the top of the bowl cover to the top of plunger shaft (not pump arm) should be 55/64 inch Adjust by bending pump connector rod at lower angle (use tool T109-213)

CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT (Fig 1)

Two separate float adjustments must be made—lateral and vertical
LATERAL ADJUSTMENT With bowl cover assembly inverted bowl cover gasket removed and float resting on seated needle place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting Side of floats should just clear the vertical uprights of float gauge (A) Adjustment should be made by bending arms of floats
VERTICAL ADJUSTMENT With float gauge in same position floats should just clear the horizontal portion of gauge Vertical distance (B) between top of float and machined surface of casting must be 1/8" (gauge T109 232) for primary floats and 3/16" (gauge T109 222) for secondary floats Adjust by bending float arms

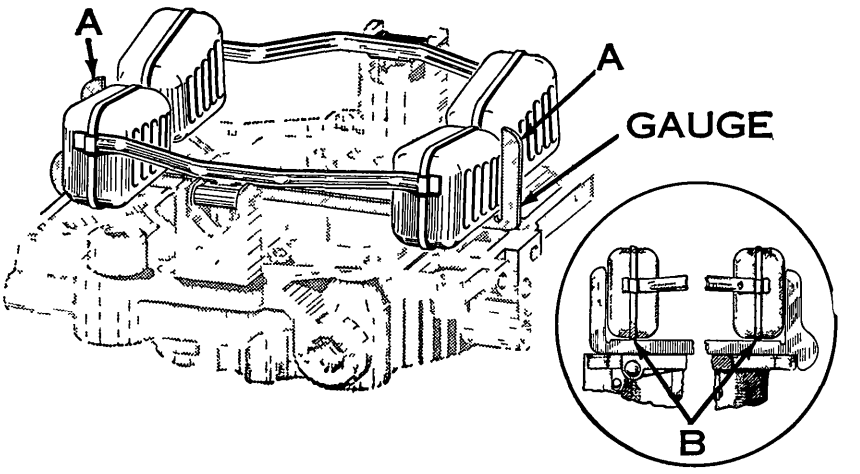

Figure 1
Float Adjustment

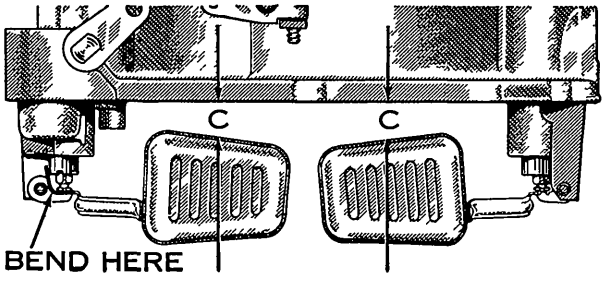

Figure 2
Float Drop Adjustment

FLOAT DROP ADJUSTMENT (Fig. 2)

With bowl cover held in upright position and measuring from center of floats the distance (C) between top of floats and bowl cover should be 5/8" for primary floats and 11/16" for secondary floats Adjust by bending stop tabs on float bracket.

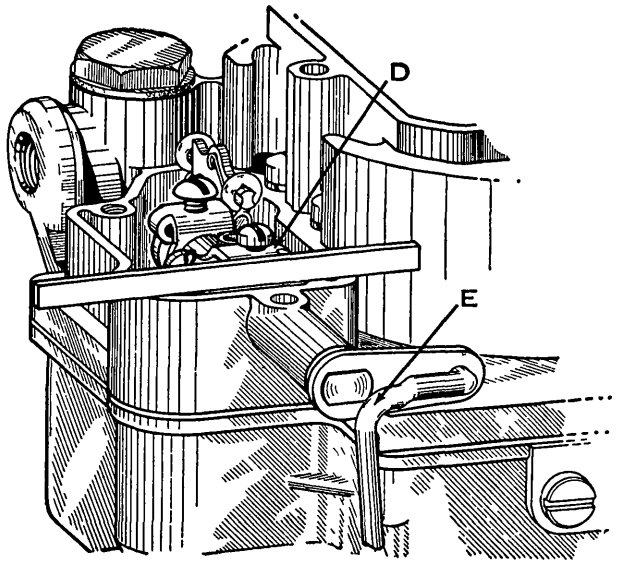

Figure 3
Pump Adjustment

PUMP ADJUSTMENT (Fig 3)

Install pump connector link in outer hole (long stroke) of pump arm with ends extending toward countershaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm (D) should be parallel to straight edge Adjust by bending throttle connector rod (early) at upper angle (E) (late) at lower angle (Use tool T109 213)

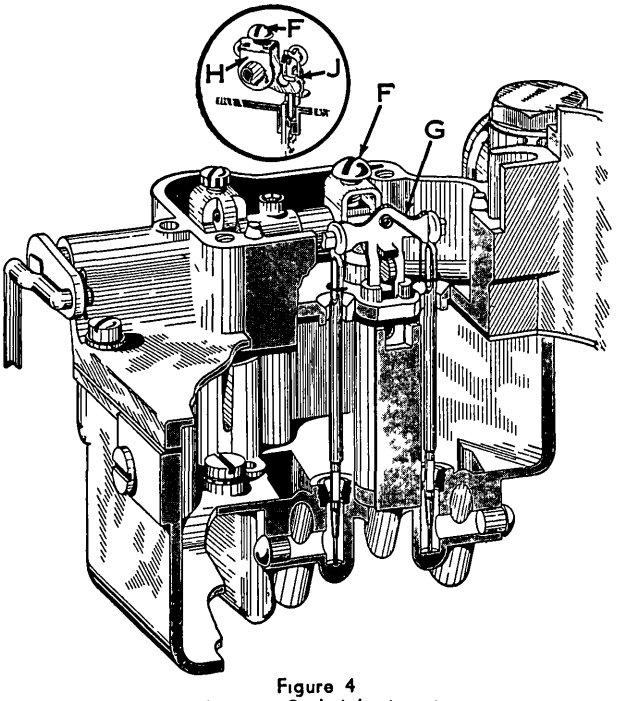

Figure 4
Metering Rod Adjustment

METERING ROD ADJUSTMENT (Fig. 4)

Metering rod adjustment is impo tant and must be made after completing the pump adjustment No metering rod gauges are necessary Procedure is as follows 1 Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw (F) 2 With metering rods in place press down on vacumeter link (G) until metering rods bottom in carbureter body casting 3 Holding rods in downward position and throttle valves seated revolve metering rod arm (H) until finger on arm contacts lip of vacumeter link (J) Hold in place and carefully tighten clamp screw (F).

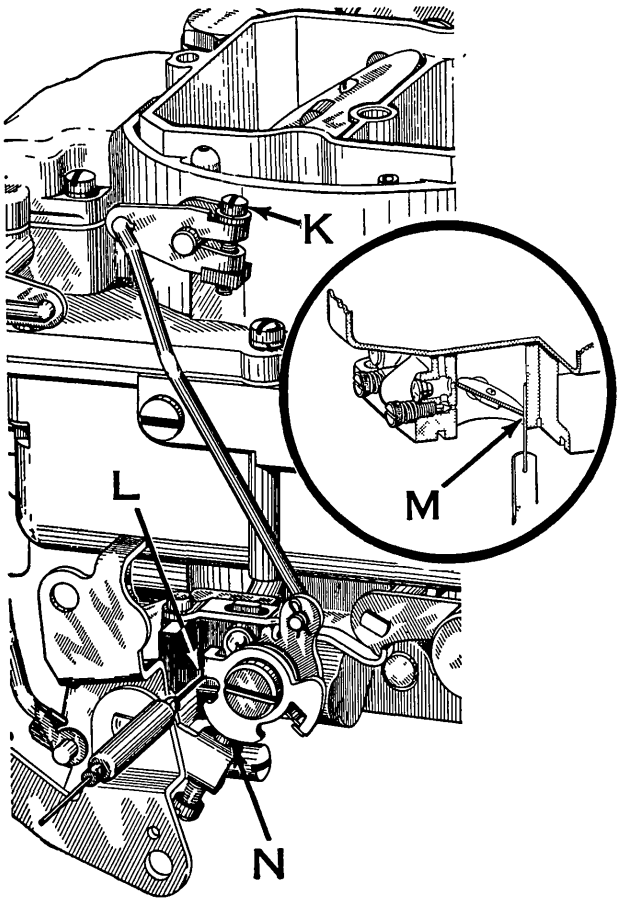

Figure 5
Fast Idle Adjustment

FAST IDLE ADJUSTMENT (Fig. 5):

(a) Loosen choke lever clamp screw (K) on choke shaft. Insert 020" feeler gauge (T109-29) (L) between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing lever towards closed position—hold in place and tighten clamp screw (K).

(b) With choke valve tightly closed, tighten fast idle adjusting screw until there is 012" (gauge T109-200) opening (M) between throttle valve and bore of carbureter (side opposite idle port). Be sure fast idle adjusting screw is on high step of cam (N) while making this adjustment

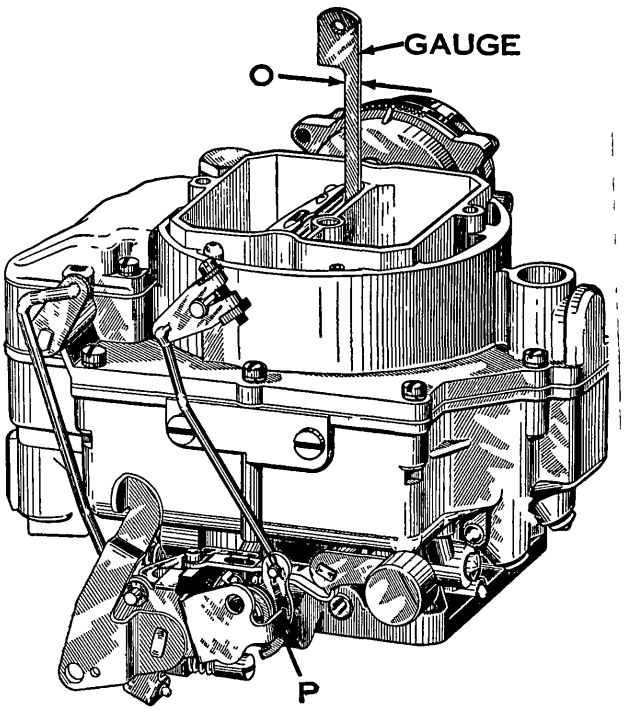

Figure 6
Unloader Adjustment

UNLOADER ADJUSTMENT (Fig. 6):

With throttle wide open there should be 3/16" clearance (O) between upper edge of choke valve and inner wall of air horn (gauge T109-28). Adjust by bending unloader lip (P) on throttle shaft lever (use bending tool T109-41)

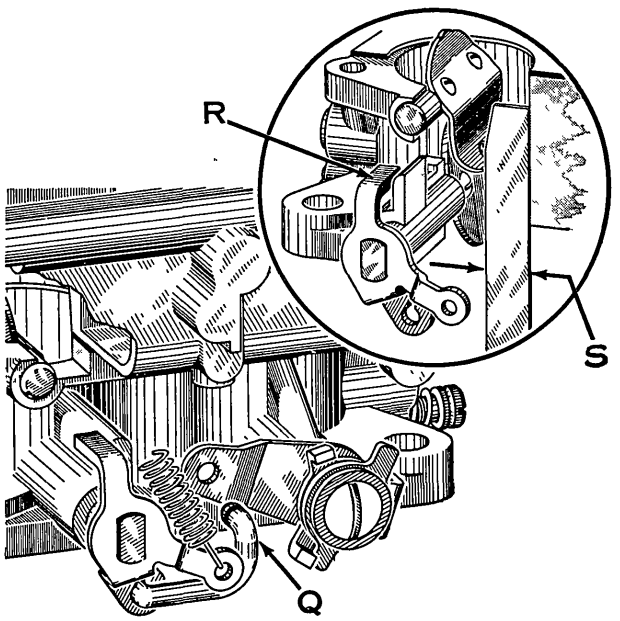

Figure 7
Auxiliary Thr ttle Valve Adjustment

AUXILIARY THROTTLE VALVE ADJUSTMENT (Fig. 7).

(a) Disconnect secondary throttle operating rod (Q). (b) Adjust stop lug (R) on secondary throttle lever (use bending tool T109-214) until there is 27/64" clearance (S) (gauge T109-242) between lower edge of auxiliary throttle valve and bore when lug (R) is against stop on flange.

CARBURETER
TRADE MARK REG U S PAT OFF
MARCA REGISTRADA

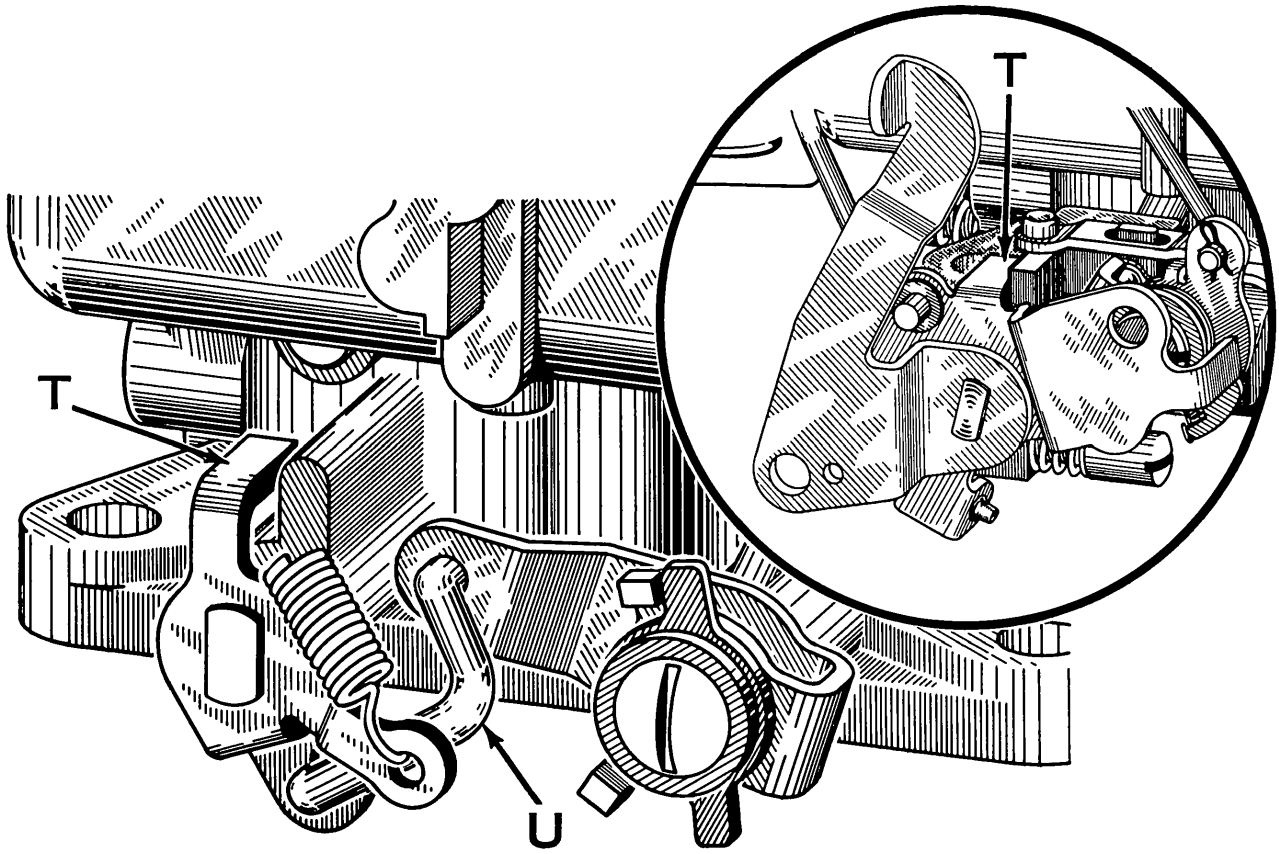

Figure 8
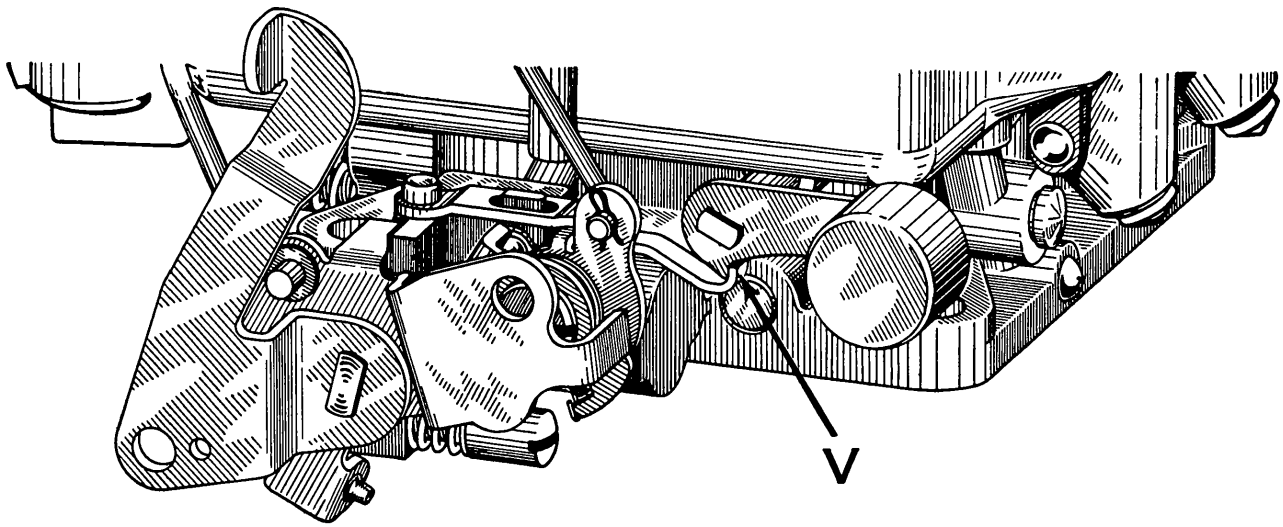
Secondary Throttle Lever Adjustment

SECONDARY THROTTLE LEVER ADJUSTMENT (Fig. 8):

The stop lug (T) on both primary and secondary throttle levers should contact boss on flange at the same time To adjust bend secondary throttle operating rod at angle (U) (use bending tool T109 213) NOTE Secondary throttle valves will be a few degrees from wide open position



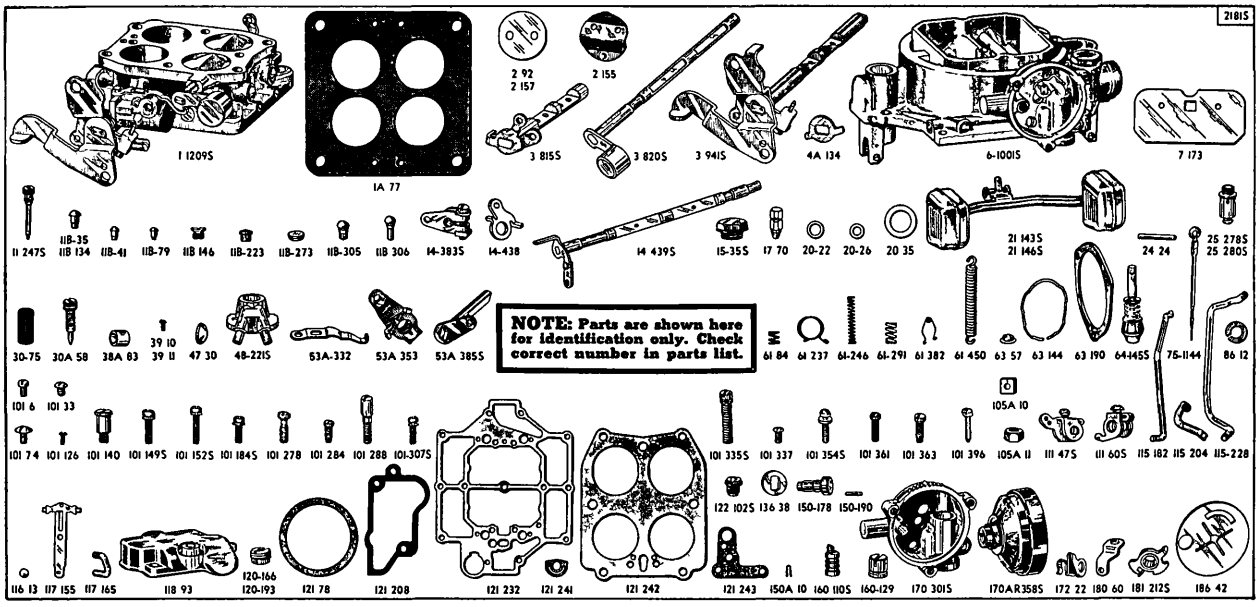


Figure 9
Auxiliary Throttle Lock-Out Adjustment

AUXILIARY THROTTLE LOCK-OUT ADJUSTMENT (Fig. 9)

This adjustment should be made after completing fast idle adjustment 1 With choke valve closed edge of hook (V) on lock-out arm should contact auxiliary throttle lever, making maximum contact of locking step on lever 2 Open choke valve Auxiliary throttle valve should become unlocked a few degrees before the choke reaches wide open position Adjust by bending lock-out arm.

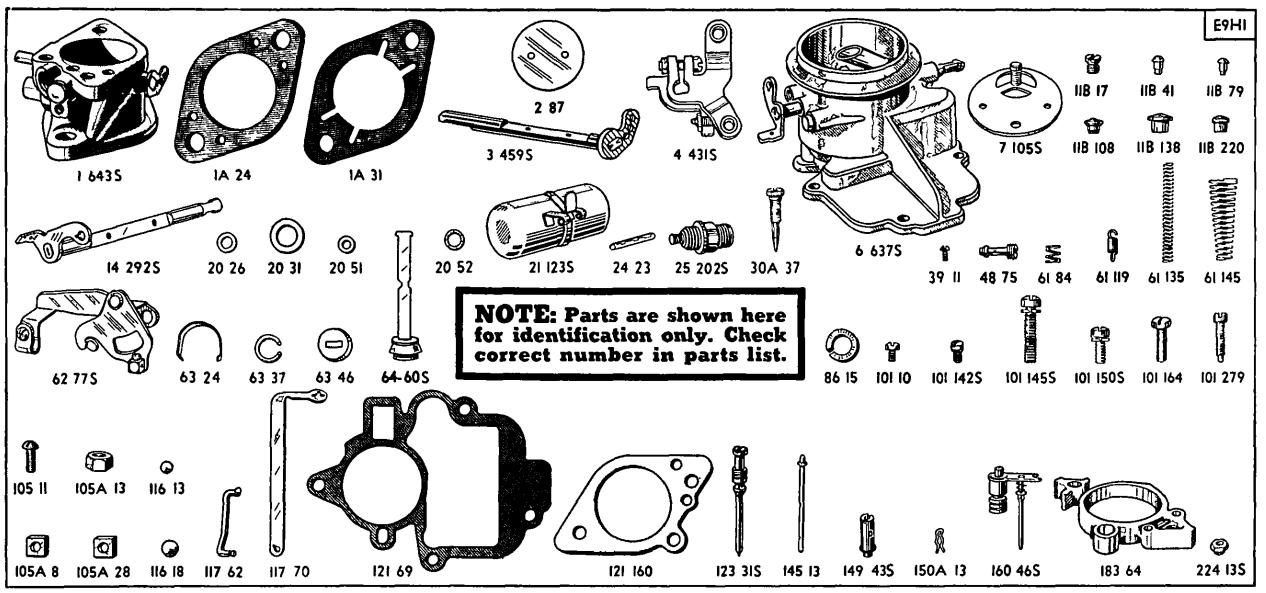
CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT This adjustment must be made with the bowl cover gasket and float pin retainer removed Place a 050 inch feeler gauge (T109-226) between lip of float and intake pin Hold the lip on float arm against the seated intake needle fully compressing the intake needle spring The distance from the top surface of the body casting to the top of the float should be 5/64 inch (gauge T109-50) To adjust bend lip on float arm

PUMP ADJUSTMENT Remove air horn assembly, back out throttle adjustment screw and be sure pump operating link is in center hole of throttle shaft arm Place Universal pump travel gauge T109-117S on edge of bowl cover so that lip of gauge extends over top of plunger shaft With throttle valve seated, turn knurled nut of gauge until lip contacts top of plunger shaft Take reading indicated on gauge Repeat with throttle valve wide open and plunger pushed to bottom of cylinder The difference in reading obtained should be '26 (26/64 inch) Adjust by bending horizontal portion of pump lifter link



Pump stroke adjustable for high or low temperatures Set to longest stroke for cold weather shorter stroke for hot weather driving

EXCESSIVE RICHNESS above 50 miles per hour may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with tool No T109-210 main vent tube can be removed and a new tube inserted with tool No T109-195 Care must be exercised in inserting new tube which must seat tightly Use new rivet to complete the installation

MAXIMUM ECONOMY and performance are secured only when breaker points spark plugs valves and motor timing are set to manufacturer s specifications After motor is properly tuned the following should also be done to insure satisfactory performance and economy

(a) Float level must be set as above
(b) Step-up rod in step up jet must seat and move freely When reassembling jet must be screwed in tight against seat
(c) Step-up piston in body casting should not bind and must be free of dirt
(d) Main metering jet can be replaced with leaner than standard metering jets, for altitude

CAUTION Do not attempt to gauge metering jets with drills These jets have been flow-tested to insure correct fuel flow

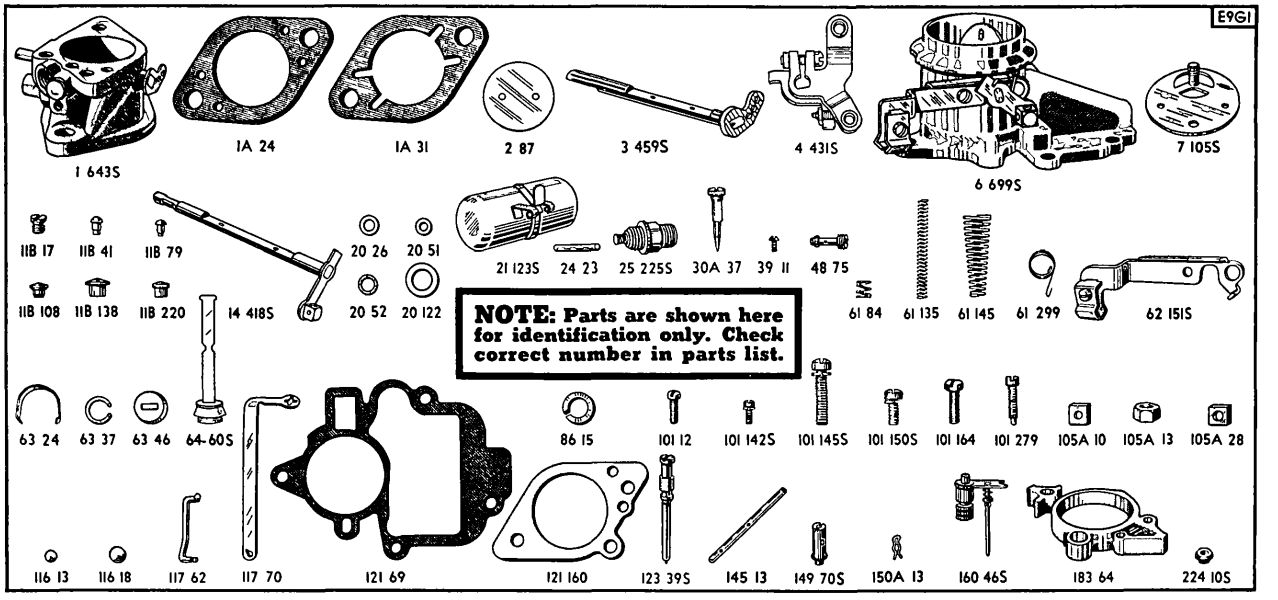
RECOMMENDED PROCEDURE FOR SETTING IDLE

1 Back out idle speed screw on rear carbureter (fully closed throttle)

2 Adjust idle speed screw on front carbureter to give 450 r p m

3 Adjust idle mixture on front carbureter to best operation and readjust idle speed if necessary



4 Back out idle speed screw on front carbureter two full turns (or whatever is necessary to insure closed throttle)

5 Adjust idle speed screw on rear carbureter to give 450 r p m

6 Adjust idle mixture screw on rear carbureter to give best operation and readjust idle speed if necessary

7 Turn in idle speed screw on front carbureter same number of turns as in step No 4

This should result in balancing the two carbureters Any further adjustment to idle speed or mixture should be made by turning the screw the same amount on each carbureter

Dodge Truck—1953-1955—Carbureter Model E9G1

WCFB Four Bore Down-Draft Climatic® Control **Carbureter No. 2191S**

CARBURETER SPECIFICATIONS

For Dodge 8 Cylinder Engine: 3-7/16 Inch Bore, 3¼ Inch Stroke

Dimensions: Flange size, 1⅛ inch Four Bore —4 bolt type.
Primary venturi size, 11/32 inch I. D.
Main venturi size, 1-1/16 inch I. D.

Float Level: See adjustments.

Vents: Inside, primary side (2), secondary side (3). Outside, primary side (2) size No. 38 (.1015 inch) drill; secondary (2) size No. 42 (.0935 inch) drill.

Gasoline Intake: Size No. 42 (.0935 inch) drill hole in needle seat.

Low Speed Jet Tube: Jet, size No. 69 (.0292 inch) drill. By-pass (2 in low speed jet), size No. 56 (.0465 inch) drill. Economizer in body size No. 56 (.0465 inch) drill.
Idle bleed, in body, size .059 inch diameter.

Idle Port: (Upper) Slot type. Primary, length .140 inch; width .030 inch. Secondary length .103 inch; width .030 inch.

Idle Port Opening: Primary, .091 to .097 inch, secondary, .067 to .073 inch, above upper edge of valve, with valve tightly closed.

Lower Port: Primary (For Idle Adjustment Screw) size No. 53 (.0595 inch) drill. Secondary (None).

Set Idle Adjustment Screw: 1 to 2 turns open. For richer mixture turn screw out. Do not idle engine below 475 R.P.M. with shift lever in neutral position.

Main Nozzle: Installed permanently. Do not remove. Anti-percolating jet, size No. 70 (.028 inch) drill.

Metering Rod: Primary economy step .071 inch diameter. Power step, .058 inch diameter.
(These rods designed with stabilizing flats on economy step.)
Secondary, none.

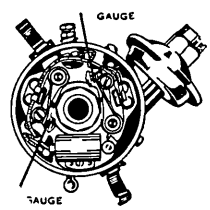
Metering Rod Jet: Primary, size .0935 inch diameter (for metering rod).
Secondary, size .0595 inch diameter (no metering rod).

Metering Rod Setting: See adjustments.

Accelerating Pump: Discharge jet (twin) primary only, size No. 68 (.031 inch) drill. Intake ball check seat size .115 to .120 inch diameter. Discharge needle seat size .070 inch diameter.

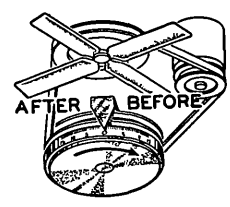
Pump Adjustment: See adjustments.

Choke: Carter Climatic® Control, set 3 points lean. Butterfly type offset choke valve, primary side only. Choke heat suction hole, restriction in piston housing, size No. 40 (.098 inch) drill.



Vacuum Spark Port: Horizontal slot (round end) .045 x .110 inch. Top of port .035 to .045 inch above valve, with valve tightly closed.

Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

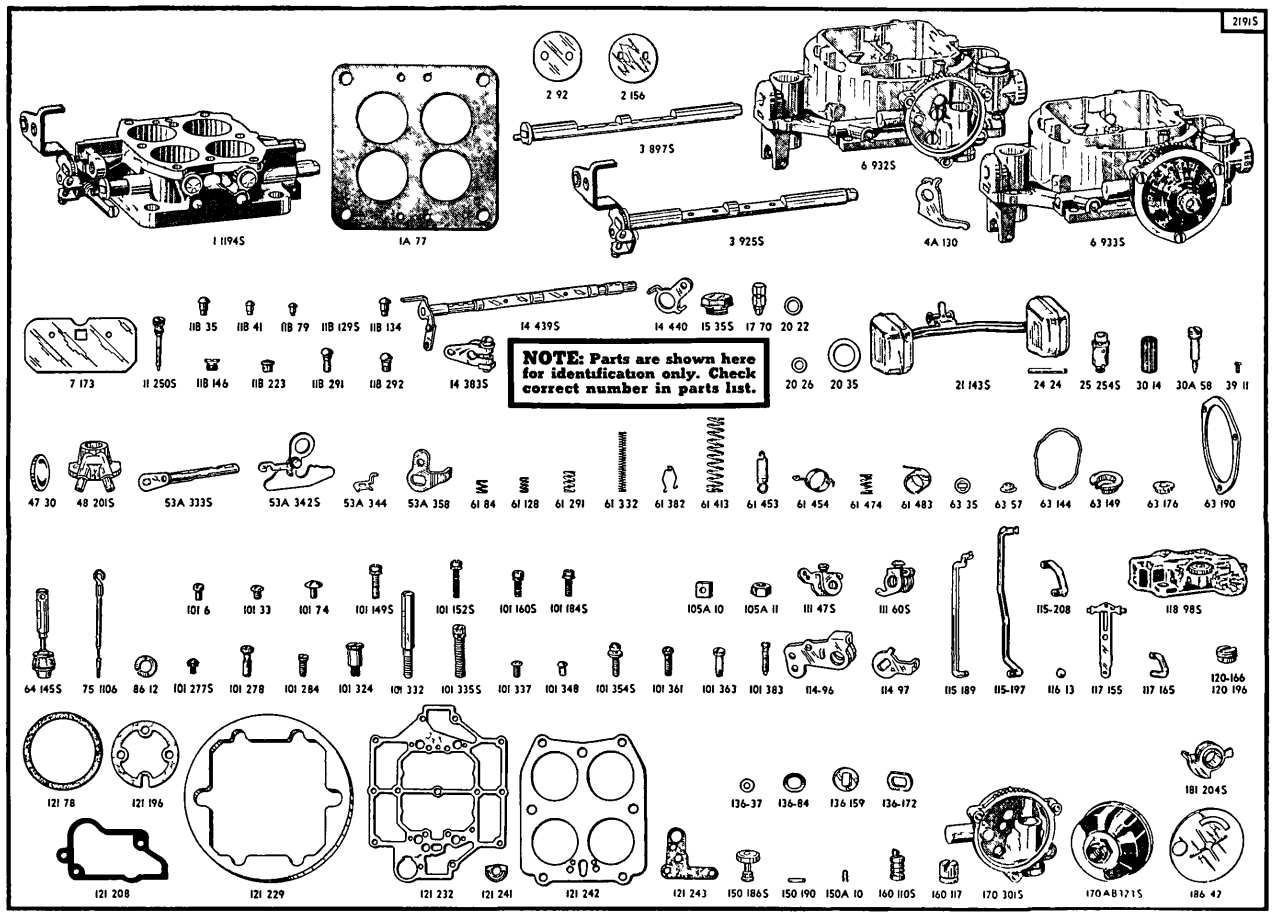
S S PRINTED IN U.S.A.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical. LATERAL ADJUSTMENT: With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge directly under center of floats with notched portions of gauge fitted over edges of casting. Side of floats should just clear the vertical upright of float gauges. Adjustment should be made by bending arms of floats. VERTICAL ADJUSTMENT: With float gauge in same position, floats should just clear the horizontal portion of gauge. The vertical distance between top of float and machined surface of casting must be 1/8 inch (gauge T109-232) for primary floats and 3/16 inch (gauge T109-222) for secondary floats. Adjust by bending float arms.

FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of float, the distance between top of floats and bowl cover should be 5/8 inch for primary floats and 11/16 inch for secondary floats. Adjust by bending stop tabs on float bracket.

PUMP ADJUSTMENT: Install pump connector link in outer hole (long stroke) of pump arm, with ends extending toward countershaft arm. Back out throttle lever set screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at lower angle. (Use tool T109-213).



METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. 2. With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.

BOWL VAPOR VENT ADJUSTMENT: This adjustment should be made after completing pump and metering rod adjustments. Install dust cover gasket and dust cover. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter. There should be 1/16 inch (gauge T109-197) between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm.

FAST IDLE AND SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: 1. Preliminary Adjustment: Loosen choke clamp screw on choke shaft. Insert .020 inch feeler gauge (T109-29) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw. 2. Secondary Throttle Lock-Out Adjustment: (a) With choke valve tightly closed, tighten fast idle adjustment screw until there is .015 inch (gauge T109-44) opening between primary throttle valve and bore of carbureter (side opposite idle port). Lock pawl should now be in unlocked position; if not, adjust by bending tang on lock pawl (use bending tool T109-105). (b) Hold primary throttle valves half way open. Open choke valve fully, then open primary throttle valves all the way. Tang on secondary throttle arm should engage in notch on lock out lever preventing secondary throttle shaft movement. Keep choke valve in wide open position. Close primary throttle valves so that lock pawl is unlocked, then open primary throttle valves all the way. Lock-out lever should fall free allowing secondary throttle valves to be open before primary throttle valves are fully open. If necessary, bend tang on secondary throttle lever to provide clearance for proper operation of lock-out lever.

UNLOADER ADJUSTMENT: With throttle wide open there should be 3/16 inch (gauge T109-28) clearance between upper edge of choke valve and inner wall of air horn. Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

SECONDARY THROTTLE LEVER ADJUSTMENT: Primary and secondary throttle valves should reach wide open position at the same time. To adjust bend throttle operating rod at upper angle. (Use bending tool T109-213.)

Dodge "V8"—1954—Carbureter No. 2191S

WHEN SERVICING, USE GASKET ASSORTMENT No. 244; REPAIR PACKAGE No. 1752

(2229S can also be used)

BBD DUAL DOWN-DRAFT **CARBURETER No. 907S**

CARBURETER SPECIFICATIONS

For Dodge Truck 8 Cylinder Engine· 3-13/16 Inch Bore, 3⅝ Inch Stroke

Dimensions. Flange size 1¼ inch dual, 4 bolt type
Throttle bore, 1-7/16 inch I D
Primary venturi, ⅜ inch I. D.
Main venturi, 1-3/16 inch I D

Float Level. See Adjustments.

Vent: Inside balance vent tube to bowl, in air horn above choke valve

Gasoline Intake: Size No 44 (.086 inch) drill hole in needle seat

Idle Tube: Jet, size 0295 inch drill
Idle bleed (in venturi cluster screw), size 059 inch drill
Idle restriction (in venturi cluster screw), size 0472 inch drill.

Idle Port: Upper, slot type length, 149 inch, width, 030 inch

Idle Port Opening: 101 to 105 inch above upper edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw): Size, 053 to .057 inch diameter.

Set Idle Adjustment Screw: ¼ to 1¼ turns open For richer mixture turn screw out Idle engine between 450 and 500 r p m

Main Nozzle Nozzle is installed permanently DO NOT RE MOVE

Main Vent Tube Side holes (4) 0354 inch diameter Bleed in top of tube size 0196 inch diameter

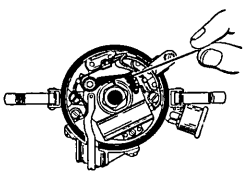
Step-Up Rod· (Vacuum operated) 022 inch diameter Length (end of wire to inside of angle) 1 11/32 inch

Metering Jet Calibrated to flow 390 to 394 cc per minute (Do not gauge for size if in doubt replace with new part)

Accelerating Pump· Pump discharge jets (2) size 0315 inch drill
Intake ball check seat size 115 to 120 inch diameter
Discharge ball check seat size 115 to 120 inch diameter

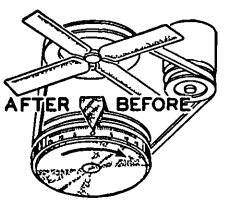
Pump Adjustment See adjustments

Choke Manual offset butterfly type with poppet valve



Vacuum Spark Port· None

Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT This adjustment must be made with the bowl cover gasket and float pin retainer removed Hold the lip on float arm against the seated intake needle, making sure the float pin is at the bottom of its guide slots The distance from the top surface of the body casting to the top of each float should be 9/32 inch (gauge T109-239) for floats with flat top or 7/32 inch (gauge T109-230) for floats with curved top If one float is lower than the other, equalize by bending the float arm If both floats require the same correction, adjust by bending lip on float arm The floats must not rub anywhere against the inner walls of the bowl If necessary bend float arms slightly to provide clearance on all sides of floats

PUMP ADJUSTMENT Back out throttle adjusting screw so that throttle valves seat in bores of carbureter Install pump connector rod in outer hole of throttle lever and pump arm pin in top hole of the plunger shaft The distance from the top of the bowl cover to the top of plunger shaft (not pump arm) should be 57/64 inch Adjust by bending pump connector rod at lower angle (use Tool T109-213)

B-B DOWN-DRAFT CARBURETER—**MODEL E9X1**

CARBURETER SPECIFICATIONS

For Dodge Truck 8 Cylinder Engine: 3-13/16 Inch Bore, 3⅝ Inch Stroke

Dimensions: Flange size, 1½ inch S. A. E.
Throttle bore, 1-11/16 inch.
Main venturi, 1-11/32 inch I. D.

Float Setting: See adjustments.

Vents: Outside, none. Inside, balance vent tube.

Gasoline Intake: Size No. 44 (.086 inch) drill in needle seat.

Idle Orifice Tube: Jet size .0276 inch diameter. Idle passage air bleed (in air horn) size No. 56 (.0465 inch) drill. Restriction in body, size .0452 inch diameter.

Idle Port: Upper port, slot type, length .149 inch; width .030 inch.

Idle Port Opening: Top of port located .118 to .122 inch above top edge of valve, with valve tightly closed.

Lower Port (For Idle Adjustment Screw): Size .053 to .057 inch diameter.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture turn screw out. Idle engine between 450-500 r.p.m.

Main Metering Jet: Calibrated to flow 315 to 319 cc per minute. (Do not gauge for size. If in doubt replace with new part.)

Main Vent: Through diffuser (air bleed inside bowl) size .0315 inch drill.

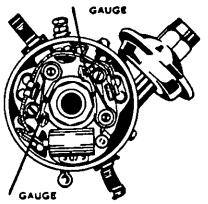
Main Vent Tube: Side Holes, 4—.0354 inch diameter.

Step-Up Jet: Size .0335 inch drill.

Accelerating Pumps: Pump intake passage, ball check seat, size .107 to .112 inch diameter. Pump discharge passage, restriction (under ball check), size .062 to .065 inch diameter in body. Pump (discharge) jet, size .0374 inch diameter.

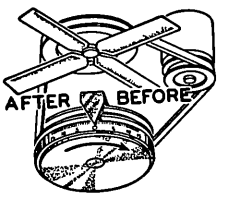
Pump Adjustment: See adjustments.

Choke: Offset butterfly type, with poppet valve.



Vacuum Spark Port: Slot (round end) type. Size .040 by .110 inch. Bottom of port .012 to .018 inch above top edge of valve with valve tightly closed.

Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT This adjustment must be made with the bowl cover gasket and float pin retainer removed Place a 050 inch feeler gauge (T109-226) between lip of float and intake pin Hold the lip on float arm against the seated intake needle fully compressing the intake needle spring The distance from the top surface of the body casting to the top of the float should be 5/64 inch (gauge T109-50) To adjust bend lip on float arm

PUMP ADJUSTMENT Remove air horn assembly, back out throttle adjustment screw and be sure pump operating link is in center hole of throttle shaft arm Place Universal pump travel gauge T109-117S on edge of bowl cover so that lip of gauge extends over top of plunger shaft With throttle valve seated, turn knurled nut of gauge until lip contacts top of plunger shaft Take reading indicated on gauge Repeat with throttle valve wide open and plunger pushed to bottom of cylinder The difference in reading obtained should be '26 (26/64 inch) Adjust by bending horizontal portion of pump lifter link

Pump stroke adjustable for high or low temperatures Set to longest stroke for cold weather, shorter stroke for hot weather driving

CARBURETER SPECIFICATIONS

For Dodge Six Cylinder Engine: 3¼ Inch Bore, 4⅝ Inch Stroke

Dimensions: Flange size, 1½ inch S A E Throttle bore 1-11/16 inch Main venturi, 1-11/32 inch I D

Float Setting: See Adjustments

Vents: Outside, none. Inside, balance vent tube.

Gasoline Intake: Size No 44 (.086 inch) drill in needle seat

Idle Orifice Tube: Jet, size .0276 inch diameter Idle passage air bleed (in air horn) size No. 56 (.0465 inch) drill. Restriction in body, size .0452 inch diameter.

Idle Port: Upper port, slot type, length .149 inch; width .030 inch

Idle Port Opening: Top of port located .118 to .122 inch above top edge of valve, with valve tightly closed.

Lower Port (For Idle Adjustment Screw): Size .053 to .057 inch diameter.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture turn screw out. Idle engine between 450-500 r p m

Main Metering Jet: Calibrated to flow 332 to 336 cc per minute (Do not gauge for size If in doubt replace with new part.)

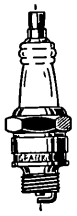
Main Vent: Through diffuser (air bleed inside bowl) size .0315 inch drill.

Main Vent Tube: Side Holes, 4—.0354 inch diameter

Step-Up Jet: Size .0394 inch drill

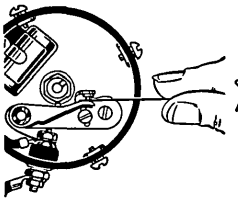
Accelerating Pump: Pump intake passage, ball check seat, size .107 to .112 inch diameter. Pump discharge passage, restriction (under ball check), size .062 to .065 inch diameter in body. Pump (discharge) jet, size .0374 inch diameter

Pump Adjustment: See adjustments



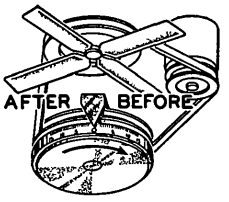
Choke: Butterfly type, with poppet valve Inter-connected to open throttle valve to fast idle position when choke is used.

Slow Closing Throttle: Dash pot with discharge (by-pass), size .019 inch, E9U1—through plunger shaft; E9V1—through valve cage



Vacuum Spark Port: Slot (round end) type. Size .040 by .110 inch Bottom of port .012 to .018 inch above top edge of valve with valve tightly closed.

Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

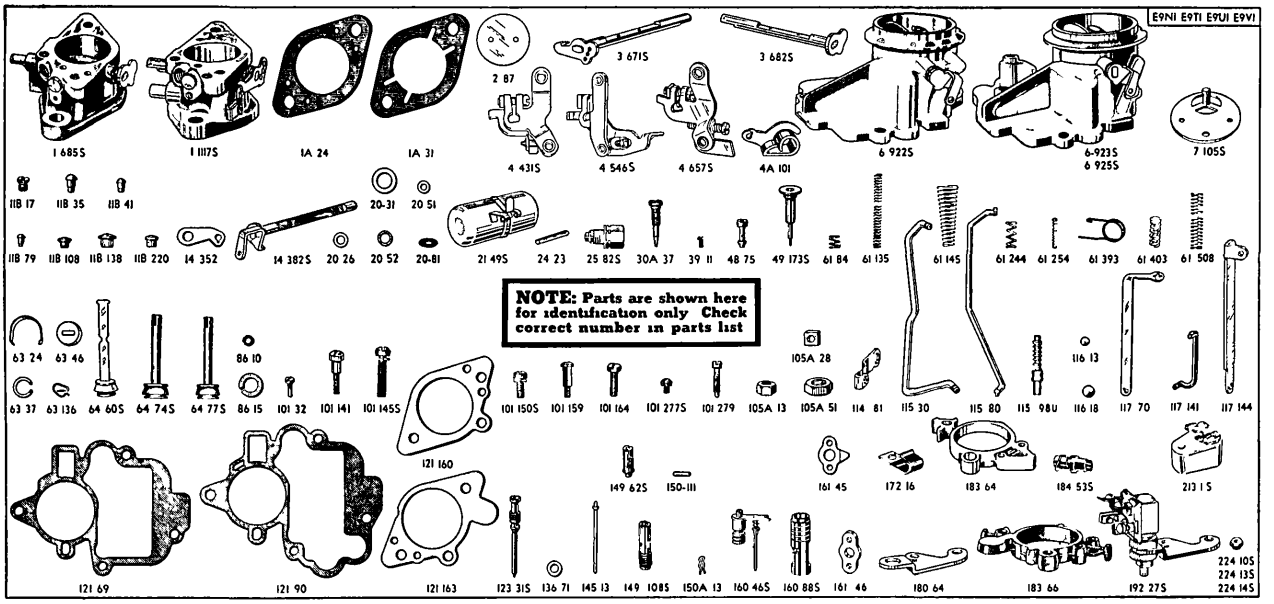
Float Setting (See Adjustments)

Idle Adjustment Screw Setting ½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

Float Adjustment: This adjustment must be made with the bowl cover gasket and float pin retainer removed. Hold the lip on float arm against the seated intake needle, making sure the float pin is at the bottom of its guide slots The distance from the top surface of the body casting to the top of the float should be 5/64 inch (gauge T109-50) (E9N1-E9T1-E9V1); 1/16 inch (gauge T109-49) (E9U1). To adjust bend lip on float arm



Pump Adjustment: No gauge is necessary. Pump lifter arm should be at a right angle to pump lifter shaft Adjustment can be made by bending pump lifter arm up or down (use tool T109-41). Pump stroke adjustable for high or low temperatures Set to longest stroke for cold weather, shorter stroke for hot weather driving.

Dash-pot Adjustment (E9U1 Only): Tighten adjustment screw — then turn counter clockwise 4½ turns Further adjustment outward will increase the action of the dash-pot and lengthen its retarding effect

Overdrive Kickdown Switch Adjustment (E9N1 Only): With throttle valve in wide open position adjust hex nuts on switch to have 1/64 to 3/64 inch clearance between kickdown lever and switch stem guide

24-23	Float lever pin
25-82S	NEEDLE AND SEAT ASSEMBLY
30A-37	Idle adjustment screw
39-11	Valve attaching screw (4)
48-75	PUMP JET
49-173S	Valve plunger rod and plate assembly (E9V1)
61-84	Idle adjustment screw spring
61-135	STEP UP PISTON SPRING
61-145	PUMP SPRING
61-244	Dash pot adjustment screw spring (E9U1)
61-254	Plunger operating spring (E9V1)
61-393	Dash pot pick up arm spring (E9U1 E9V1)
61-403	Push rod sleeve spring (E9V1)
61-508	Switch piston spring (E9V1)
63-24	FLOAT LEVER PIN RETAINER
63-37	INTAKE CHECK BALL RETAINER RING
63-46	Pump spring retainer
63-136	Connector retainer clip (E9V1)
64-60S	PUMP PLUNGER AND ROD ASSEMBLY
64-74S	Dash pot plunger and rod assembly (E9U1)
64-77S	Dash pot plunger and rod assembly (E9V1)

Part No.	PART NAME
86-10	Dash pot lifter link attaching screw lock washer (E9U1-E9V1)
86-15	Flange stud lock washer (2)
101-32	Dash pot lifter link attaching screw (E9U1-E9V1)
101-141	Dash pot adjustment screw (E9U1)
101-145S	Body flange attaching screw and lock washer assembly (3)
101-150S	Air horn attaching screw and washer assembly (4)
101-159	Electro magnet assembly attaching screw (E9V1)
101-164	Throttle lever clamp screw
101-277S	Plate attaching screw and washer assembly (E9V1)
101-279	Throttle lever adjusting screw
105A-13	Flange stud nut (2)
105A-28	Throttle lever clamp nut
105A-51	Kickdown switch bracket attaching nut (E9N1) (2)
114-81	Dash pot pick up arm (E9U1 E9V1)
115-30	Choke connector rod (E9N1 E9T1)
115-80	Choke connector rod (E9U1 E9V1)
115-98U	Push rod assembly and spring unit (consists of 1 61 403 and 1-115-79S) (E9V1)
116-13	PUMP INTAKE CHECK BALL
116-18	PUMP DISCHARGE CHECK BALL
117-70	PUMP LIFTER LINK
117-141	PUMP LINK
117-144	Dash pot lifter link (E9U1 E9V1)
121-69	BODY GASKET (E9N1 E9T1)
121-90	BODY GASKET (E9U1 E9V1)
121-160	BODY FLANGE GASKET (E9N1 E9T1 E9U1)—2) (E9V1—1)
121-163	BODY TO INSULATOR GASKET (E9V1)
123 31S	IDLE ORIFICE TUBE AND PLUG ASSEMBLY
136 71	Switch plunger washer (E9V1)
145-13	MAIN VENT TUBE
149-62S	STEP UP JET ASSEMBLY
149-108S	Dash-pot valve cage assembly (E9V1)
150-111	Dash pot pin (E9U1 E9V1)
150A-13	PIN SPRING (E9V1—2) (E9N1 E9T1 E9U1—1)
160 46S	STEP UP PISTON PLATE AND ROD ASSEMBLY
160-88S	Kickdown switch piston assembly (E9V1)
161-45	Terminal end plate (E9V1)
161-46	Push rod end plate (E9V1)
172-16	Cable clip (E9N1 E9V1)
180-64	Kickdown switch bracket (E9N1)
183-64	Insulator (E9N1 E9T1 E9U1)
183-66	Insulator (E9V1)
184-53S	Terminal block and retainer clip assembly (E9V1)
192-27S	Kickdown switch assembly (complete) (E9N1)
213-11S	Electro magnet and housing assembly (E9V1)
224-10S	MAIN METERING JET ASSEMBLY—STANDARD
224-13S	Main metering jet assembly—1 size lean
224-14S	Main metering jet assembly—2 size lean

NOTE Figures in parentheses indicate number of pieces used in one carbureter. Where no figure is shown, only one is used.

BB DOWN-DRAFT CARBURETERS—**MODELS DTL1-DTL2**

CARBURETER SPECIFICATIONS

For Dodge Six Cylinder Engine: 3¼ Inch Bore, 4⅜ Inch Stroke

Dimensions: Flange size, 1½ inch S. A. E.
Throttle bore, 1-9/16 inch.
Main venturi, 1¼ inch I. D.

Float Setting: See Adjustments.

Gasoline Intake: Size No. 44 (.086 inch) drill in needle seat.

Idle Orifice Tube: Jet, size .0276 inch diameter. Idle passage air bleed (in air horn), size .065 inch diameter. Restriction in body, size .0565 inch diameter.

Idle Port: Upper port, slot type, length .149 inch; width .030 inch.

Idle Port Opening: Top of port located .118 to .122 inch above top edge of valve with valve tightly closed.

Lower Port (For Idle Adjustment Screw): Size .053 to .057 inch diameter.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture turn screw out. Idle engine between 450-500 r.p.m. (gear shift lever in neutral).

Main Metering Jet: Calibrated to flow 256 cc per minute. (Do not gauge for size. If in doubt replace with new part.)

Main Vent: Through diffuser (air bleed inside bowl) size .0315 inch diameter.

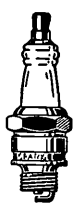
Main Vent Tube: Side holes: 6—.0354 inch diameter.

Step-Up Jet: Size No. 65 (.035 inch) drill.

Accelerating Pump: Pump intake passage ball check seat, size .107 to .112 inch diameter. Pump discharge passage, restriction (under ball check), size .062 to .065 inch diameter in body.

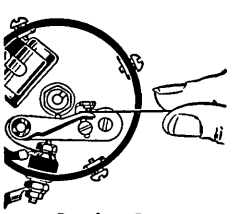
Pump (discharge) jet, size .0276 inch drill.

Pump Adjustment: See Adjustments.



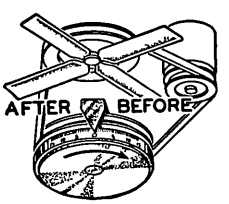
Choke: Butterfly type, with poppet valve.

Slow Closing Throttle: Dash pot with discharge (By-pass), size .019 inch drill through valve cage.



Vacuum Spark Port: Slot (round end) type. Size .040 by .110 inch. Bottom of port .021 to .027 inch above top edge of valve with valve tightly closed.

Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: This adjustment must be made with the bowl cover gasket and float pin retainer removed. Place a .050 inch feeler gauge (T109-226) between lip of float and intake pin. Hold the lip on float arm against the seated intake needle fully compressing the intake needle spring. The distance from the top surface of the body casting to the top of the float should be 5/64 inch (gauge T109-50). To adjust bend lip on float arm.

PUMP ADJUSTMENT: Remove air horn assembly, back out throttle adjustment screw and be sure pump operating link is in center hole of throttle shaft arm. Place Universal pump travel gauge T109-117S on edge of bowl cover so that lip of gauge extends over top of plunger shaft. With throttle valve seated turn knurled nut of gauge until lip contacts top of plunger shaft. Take reading indicated on gauge. Repeat with throttle valve wide open and plunger pushed to bottom of cylinder. The difference in reading obtained should be "22" (22/64") plunger travel. Adjust by bending horizontal portion of pump lifter link.

Pump stroke adjustable for high or low temperatures. Set to longest stroke for cold weather, shorter stroke for hot weather driving.

EXCESSIVE RICHNESS above 50 miles per hour may be caused by a clogged main vent tube. After removal of rivet

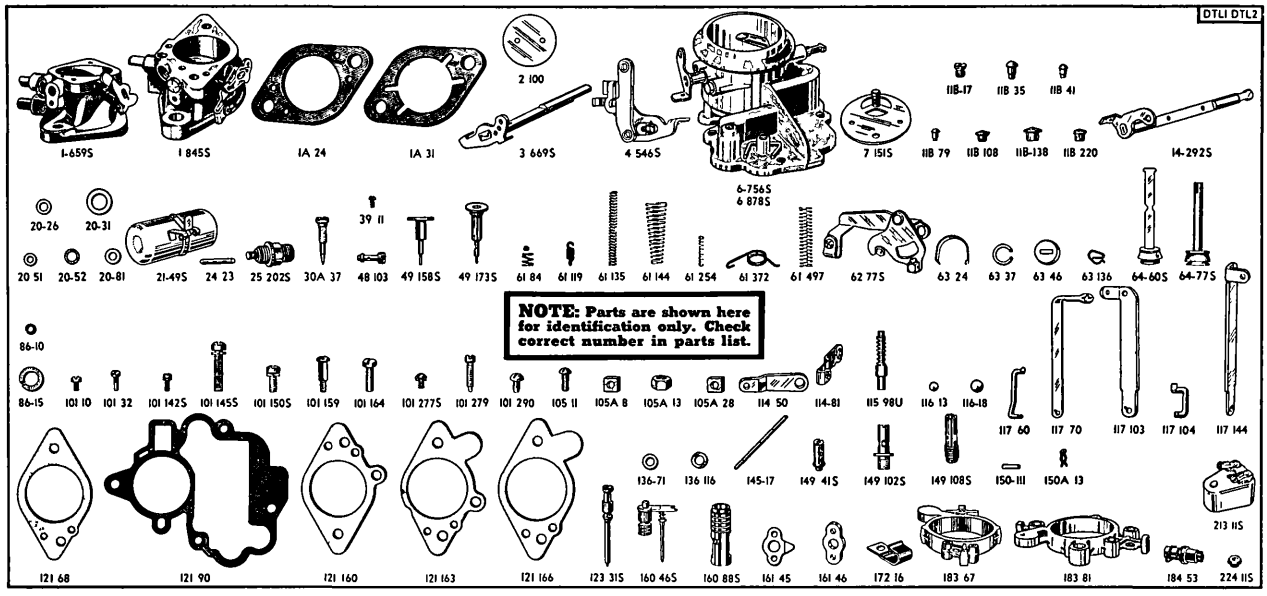
plug beneath float bowl with tool No. T109-210 main vent tube can be removed and a new tube inserted with tool No T109-195 Care must be exercised in inserting new tube which must seat tightly Use new rivet to complete the installation

MAXIMUM ECONOMY and performance are secured only when breaker points, spark plugs, valves and motor timing are set to manufacturer's specifications After motor is properly tuned, the following should also be done to insure satisfactory performance and economy



(a) Float level must be set as above

(b) Step-up rod in step-up jet must seat and move freely When reassembling, jet must be screwed in tight against seat

(c) Step-up piston in body casting should not bind and must be free of dirt

(d) Main metering jet can be replaced with leaner than standard metering jets, for altitude

CAUTION. Do not attempt to gauge metering jets with drills These jets have been flow-tested to insure correct fuel flow

B-B UP-DRAFT CARBURETERS—Nos. 6N1-6N2

CARBURETER SPECIFICATIONS

For Dodge Six Cylinder Engines:

3-7/16 Inch Bore, 4¼ Inch Stroke: B-2-GM, GMA, HM, HMA, HHM, HHMA; B-3-GM, GMA, HM, HMA, HHM, HHMA
3-7/16 Inch Bore, 4½ Inch Stroke: B-2-JM, JMA, KM, KMA; B-3-JM, JMA, KM, KMA; B-4-HM; C-1-HM6; C-3-HM6
3-7/16 Inch Bore, 4¾ Inch Stroke: B-4-JM, KMA; C-1-JM6, KMA6; C-3-HHM6, JM6, KMA6

Dimensions: Flange size, 1½ inch (38.10 mm).
Throttle bore, 1-7/16 inch (38.51 mm).
Main venturi, 1⅛ inch I. D. (28.58 mm).
Air bleed through venturi to idle passage .0885 to .0905 inch diameter (2.25 to 2.30 mm) drill.

Float Setting: Distance from top of float to top surface of lower body casting 1/32 to 1/16 inch (.79 to 1.59 mm).

Vent: To float chamber size, No. 30 (3.26 mm) drill.

Balance Vent Tube: Inside diameter, 7/32 inch (5.56 mm).

Gasoline Intake Needle: Triangular, horizontal. No. 44 (2.18 mm) drill in needle seat.

Idle Jet Tube: Jet size, .0236 inch (.60 mm) drill.

Idle Ports: Lower port size: .078 to .080 inch (1.98 to 2.03 mm) diameter. Top of port located .000 to .004 inch (.0 to .102 mm) below lower edge of valve.
Upper port size: .053 to .057 inch (1.35 to 1.45 mm) diameter (for idle adjustment screw).

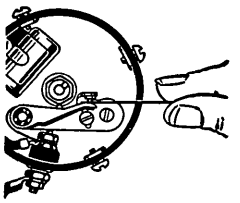
Set Idle Adjustment Screw: ½ to 1 turn open. For richer mixture, turn screw out. Do not idle engine below 300 r.p.m. or 6 m.p.h.

Main Metering Screw: Calibrated to flow 316 to 320 cc per minute. (Do not gauge for size. If in doubt, replace with new part.)

Nozzle: Discharge jet size, No. 33 (2.87 mm) drill.
Side holes: 2—.0394 inch (1.00 mm) drill 1/16 inch (1.59 mm) from shoulder.
1—.051 inch (1.3 mm) drill ⅜ inch (9.525 mm) from shoulder.
1—.063 inch (1.6 mm) drill 23/32 inch (18.256 mm) from shoulder.
1—.051 inch (1.3 mm) drill 1-1/16 inch (26.99 mm) from shoulder.

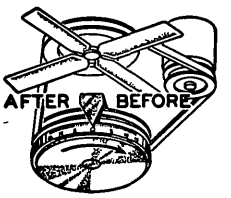
Air Bleed to Nozzle: (Vent tube) Size, .0394 inch (1.00 mm) drill.

Step-Up Jet: (Power Orifice) Size, .0472 inch (1.20 mm) drill.



Accelerating Pump: Type, low pressure, delayed action. Stroke: Summer setting (inner hole, short stroke 9/16 inch (14.29 mm).
Winter setting (outer hole, long stroke) 1 inch (25.40 mm).
Pump intake ball check: Size .125 inch (3.175 mm).
Pump discharge (through nozzle).

Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Idle Adjustment Screw Setting
½ to 1 Turn Open

CARBURETER ADJUSTMENTS

To Secure a Good Idle: Set throttle lever adjusting screw so motor runs approximately 300 r.p.m. Then set idle adjustment screw so motor fires evenly. Correct setting will be found between ½ to 1 turn open. A richer mixture is obtained by backing out adjustment screw—a leaner mixture by turning screw in. If motor stalls while idling, remove idle passage tube and idle jet tube and clean with compressed air.

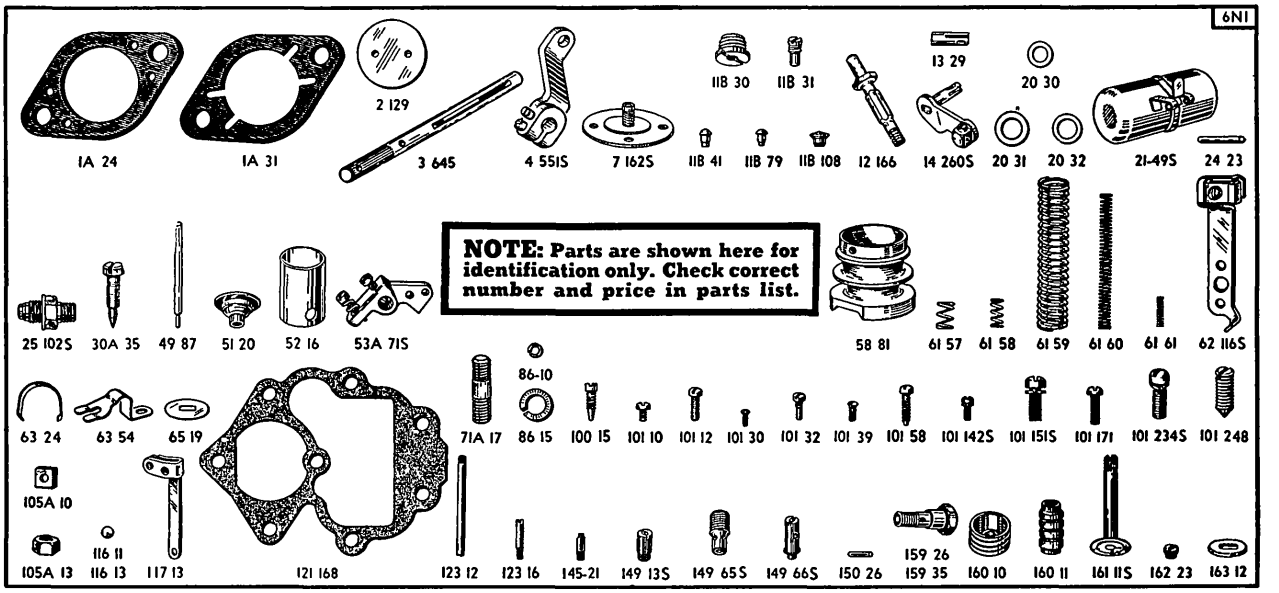
CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.

To Improve Acceleration Examine pump link setting For winter driving link screw should be set in outer hole, giving long stroke, for hot weather, in high altitudes, pump link should be connected in inner hole, giving short stroke If this does not give desired results, the main metering jet, pump metering jet check valve assembly and pump valve assembly should be removed and cleaned with compressed air

If Motor Loads—Check Float Level Wear on lip of float lever will raise float level from factory setting causing carbureter to load up To lower float level, bend lip of float lever toward needle To raise float level bend lip away from needle A very slight bend is sufficient Be sure to bend lip of float **not** bracket



Economy (a) Maximum economy is secured only when breaker points, spark plugs, valves and motor timing are set to manufacturer s specifications

(b Float level must set as instructed on Page 1

(c) Step-up valve cage assembly should be examined Ball check in this assembly must seat and move freely When reassembling valve cage must be screwed in tight against seat

(d) Step-up push rod must move freely in upper and lower guides

(e) Step-up piston in upper casting should not bind and must be free from dirt

B-B DOWN-DRAFT CARBURETERS—**MODELS DTE1-DTE2**

CARBURETER SPECIFICATIONS

For Dodge Truck Six Cylinder Engine: 3¼ Inch Bore, 4⅜ Inch Stroke
For Dodge Truck Six Cylinder Engine: 3¼ Inch Bore, 4⅝ Inch Stroke (B-3-D)

Dimensions: Flange size, 1½ inch S. A. E.
Throttle bore, 1-9/16 inch (39.69 mm).
Main venturi, 1¼ inch (31.75 mm) I. D.

Float Setting: When using a solid needle, the distance from the top of float, should be 5/64 inch (1.98 mm) (gauge T109-50), plus or minus 1/64 inch (.397 mm) below top surface of carbureter body casting. Float setting for spring loaded needle and seat assembly: See footnote (*) on page two.

Vents: Outside, none. Inside balance vent .218 inch (5.54 mm) diameter.

Gasoline Intake Needle: Triangular, horizontal. No. 44 (2.18 mm) drill in needle seat.

Idle Orifice Tube: Jet size, .0276 inch (.70 mm). Idle passage air bleed (in air horn), size .065 inch (1.65 mm). Restriction in body, size .054 to .055 inch (1.37 to 1.39 mm) diameter.

Idle Ports: Upper port, slot type; length .149 inch (3.789 mm): width, .030 inch (.76 mm).
Top of port located .118 to .122 inch (2.997 to 3.099 mm) above top edge of valve.
Lower port: (For Idle Adjustment Screw) Size, .053 to .057 inch (1.35 to 1.45 mm) diameter.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture, turn screw out. Idle engine between 450-500 r.p.m

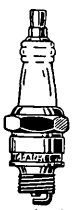
Main Metering Jet: Calibrated to flow 256 cc per minute. (Do not gauge for size. If in doubt, replace with new part.)

Main Vent: Through diffuser (air bleed inside bowl) size .0315 inch (.80 mm) drill.

Main Vent Tube: Side holes, 6—.0354 inch diameter.

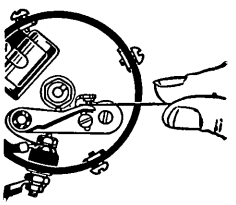
Step-Up Jet: No. 65 (.89 mm) drill size.

Accelerating Pump: Type, delayed action. Stroke, summer setting (inner hole, short stroke). Intermediate setting (center hole). Winter setting (outer hole, long stroke).
Pump intake passage, ball check seat, size .115 to .120 inch (2.93 to 3.05 mm) diameter.
Pump discharge passage; restriction (under ball check), size .062 to .065 inch (1.58 to 1.65 mm) diameter in body.
Pump (discharge) jet, size .0276 inch (.70 mm) drill.



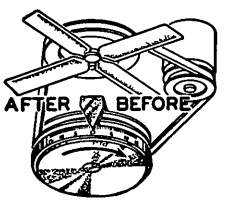
Pump Adjustment: 22/64" (8.731 mm) plunger travel (center hole). Use gauge No. T109-117S.

Choke: Butterfly type, with poppet valve.



Vacuum Spark Port: Slot (round end) type. Size .040 by .110 inch (1.016 to 2.794 mm). Bottom of port, .021 to .027 inch (.533 to .686 mm) above top edge of valve.

Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service, check float level. Wear on lip of float lever will raise float level. Before adjusting float, be sure float lever pin is firmly seated. Reset float level by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level. Bend vertical lip of float only.

If motor stalls while idling, set throttle lever adjusting screw so motor runs between 450-500 r.p.m. Then set idle adjustment screw to specifications. If these adjustments do not correct the trouble, remove idle orifice tube and plug assembly. Clean tube and passages with compressed air.

If acceleration is not satisfactory, remove pump jet and clean with compressed air. However, it is usually advisable to replace the pump jet, as its cost is nominal. All jets must be seated gasoline tight. Poor acceleration may be due to damaged or worn plunger leather in accelerating pump, sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage. If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather.

Correct air fuel ratio is provided by a "balance tube" in the air horn. The balance tube should be checked each time the

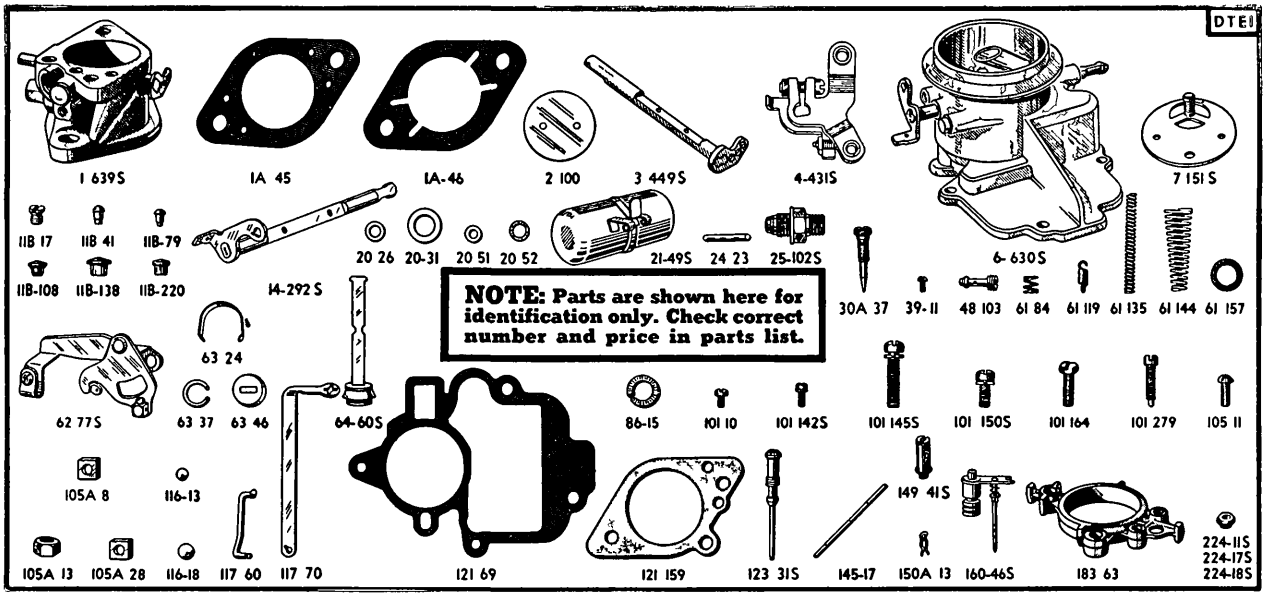
MARCA REGISTRADA

PRINTED IN U.S.A.

carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner Should the cleaner become clogged, the capacity will be reduced but the air-fuel mixture ratio will not be changed

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with tool No T109-43, main vent tube can be removed and a new tube inserted with tool No T109-195 Care must be exercised in inserting new tube which must seat tightly Use new rivet to complete the installation



Pump Adjustment Remove air horn assembly, back out throttle adjustment screw and be sure pump operating link is in center hole of throttle shaft arm Place Universal pump travel gauge T109-117S on edge of bowl cover so that lip of gauge extends over top of plunger shaft Turn knurled nut of gauge until lip contacts top of plunger shaft with throttle valve seated Take reading indicated on gauge Repeat with throttle valve wide open and plunger pushed to bottom of cylinder The difference in reading obtained should be ' 22 (22/64) plunger travel

Adjust by bending horizontal portion of pump lifter link Pump stroke adjustable for high or low temperatures Set to longest stroke for cold weather, shorter stroke for hot weather driving

Maximum economy and performance are secured only when breaker points, spark plugs, valves and motor timing are set to manufacturer s specifications After motor is properly tuned, the following should also be done to insure satisfactory performance and economy

(a) Float level must be set as above
(b) Step-up rod in step-up jet must seat and move freely When reassembling, jet must be screwed in tight against seat
(c) Step-up piston in body casting should not bind and must be free of dirt
(d) Main metering jet can be replaced with leaner than standard metering jets, for altitude

CAUTION Do not attempt to gauge metering jets with drills These jets have been flow-tested to insure correct fuel flow

is in center hole of throttle shaft arm Place universal pump travel gauge T109-117S on edge of bowl cover so that lip of gauge extends over top of plunger shaft Turn knurled nut of gauge until lip contacts top of plunger shaft with throttle valve seated Take reading indicated on gauge Repeat with throttle valve wide open and plunger pushed to bottom of cylinder The difference in reading obtained should be '22' (22/64") plunger travel

Adjust by bending horizontal portion of pump lifter link Pump stroke adjustable for high or low temperatures Set to longest stroke for cold weather, shorter stroke for hot weather driving

Dash-Pot Adjustment Engines operating in connection with fluid couplings frequently tend to stall during rapid deceleration unless the throttle closes slowly Slow throttle movement is necessary only during the last part of the closing The dash-pot or decelerating pump acts as a snubber to the throttle allowing fast movement to almost closed position, then slow closing from that point to the idle position

When the throttle is released, the throttle valve closes rapidly until throttle shaft arm contacts the dash-pot pick-up arm Then the dash-pot plunger must be pushed to the bottom of the cylinder before the throttle can close A ball check located in the lower end of the plunger shaft seals the larger upper opening and the gasoline must leave the cylinder through the small metered hole in lower part of the shaft

This reduces the rate at which plunger can be forced to the bottom of the cylinder making the last part of the throttle closing very slow **The adjusting screw (in top of bowl cover) should be opened five full turns from closed position** for average conditions Under extreme driving conditions greater openings may be necessary, although extreme dash-pot action will affect gear changes, and not enough action will allow engine to stall

Be sure plunger leather is soft and pliable and effects a good seal against the cylinder wall

MODELS
"D-46", "D-47"
1953

(D6H2 and 195-63U can also be used)

BB DOWN-DRAFT CARBURETER—**MODEL D6U1**

CARBURETER SPECIFICATIONS

For Dodge Six Cylinder Engine: 3¼ Inch Bore, 4⅝ Inch Stroke

Dimensions: Flange size, 1½ inch S. A. E.
Throttle bore, 1-9/16 inch.
Main venturi, 1¼ inch I. D.

Float Setting: See adjustments.

Vents: Outside, none. Inside, balance vent tube.

Gasoline Intake: Size No. 44 (.086 inch) drill in needle seat.

Idle Orifice Tube: Jet, size .0276 inch.
Idle passage air bleed (in air horn), size .065 inch.
Restriction in body, size .056 to .057 inch diameter.

Idle Port: Upper port, slot type, length .149 inch; width, .030 inch.

Idle Port Opening: Top of port located .118 to .122 inch above top edge of valve, with valve tightly closed.

Lower Port (For Idle Adjustment Screw): Size, .053 to .057 inch diameter.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture turn screw out. Idle engine between 450-500 r.p.m.

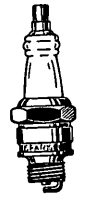
Main Metering Jet: Calibrated to flow 287 cc per minute. (Do not gauge for size. If in doubt, replace with new part.)

Main Vent: Through diffuser (air bleed inside bowl) size .0315 inch drill.

Main Vent Tube: Side holes, 6—.0354 inch diameter.

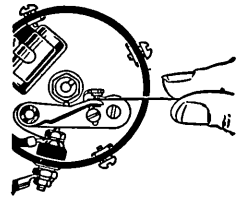
Step-Up Jet: Size .0295 inch diameter.

Accelerating Pump: Pump intake passage, ball check seat, size .115 to .120 inch diameter.
Pump discharge passage, restriction (under ball check), size .062 to .065 inch diameter in body.
Pump (discharge) jet, size .0276 inch drill.



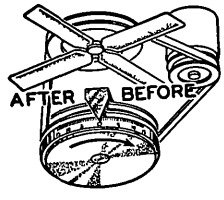
Pump Adjustment: See adjustments.

Choke: Butterfly type, with poppet valve. Inter-connected to open throttle valve to fast idle position when choke is used.

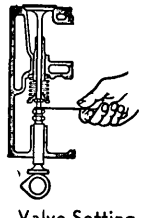


Vacuum Spark Port: Slot (round end) type. Size .040 by .110 inch. Bottom of port, .021 to .027 inch above top edge of valve, with valve tightly closed.

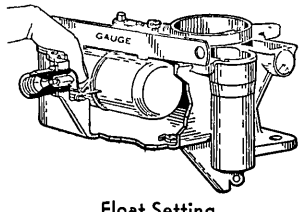
Motor Tune-Up—Be Accurate!



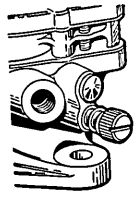
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .035"



Breaker Point Setting .020"



Ignition Timing Breaker Points to Open: 2° B. T. C.

Valve Setting (Hot) Intake .010" Exhaust .010"

Float Setting 5/64 Inch (Use Gauge T109-50)

Idle Adjustment Screw Setting ½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: This adjustment must be made with the bowl cover gasket and float pin retainer removed. Hold the lip on float arm against the seated intake needle, making sure the float pin is at the bottom of its guide slots. The distance from the top surface of the body casting to the top of the float should be 5/64 inch (gauge T109-50). To adjust bend lip on float arm.

PUMP ADJUSTMENT: Remove air horn assembly, back out throttle adjustment screw and be sure pump operating link is in center hole of throttle shaft arm. Place Universal pump travel gauge T109-117S on edge of bowl cover so that lip of gauge extends over top of plunger shaft. With throttle valve seated turn knurled nut of gauge until lip contacts top of plunger shaft. Take reading indicated on gauge. Repeat with throttle valve wide open and plunger pushed to bottom of cylinder. The difference in reading obtained should be "22" (22/64") plunger travel. Adjust by bending horizontal portion of pump lifter link.

Pump stroke adjustable for high or low temperatures. Set to longest stroke for cold weather, shorter stroke for hot weather driving.

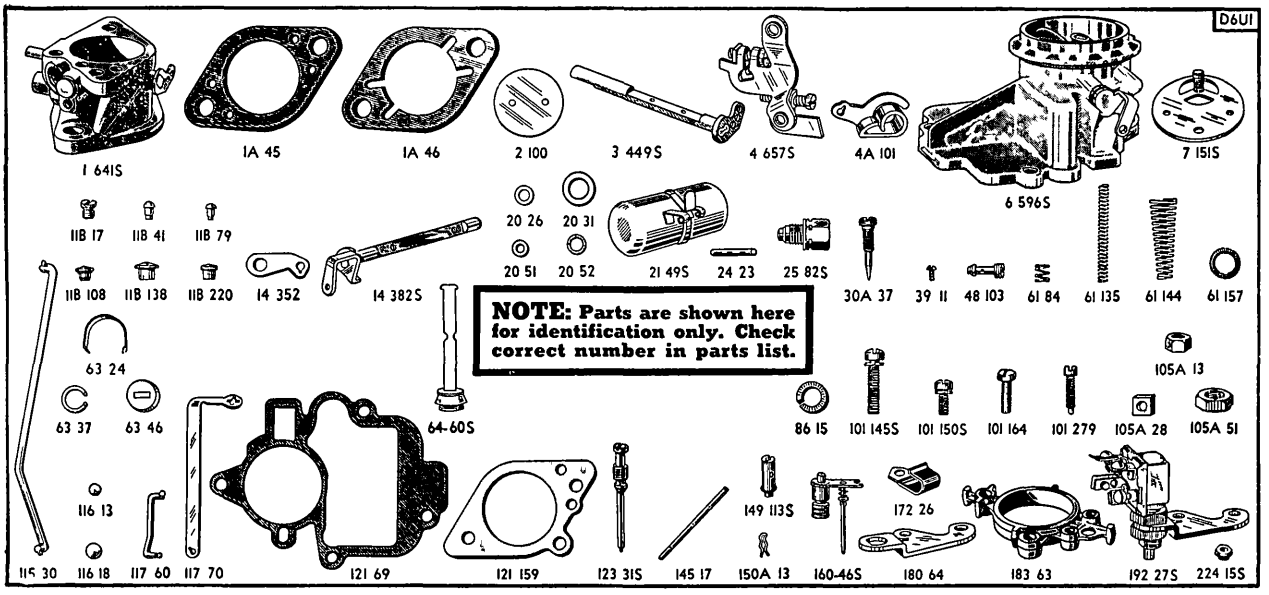
PRINTED IN U.S.A.

OVERDRIVE KICKDOWN SWITCH ADJUSTMENT· With throttle valve in wide open position, adjust hex nuts on switch to have 1/64 inch to 3/64 inch clearance between kickdown lever and switch stem guide

EXCESSIVE RICHNESS above 50 miles per hour may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with tool No T109-210 main vent tube can be removed and a new tube inserted with tool No T109-195 Care must be exercised in inserting new tube which must seat tightly Use new rivet to complete the installation

MAXIMUM ECONOMY and performance are secured only when breaker points, spark plugs valves and motor timing are set to manufacturer s specifications After motor is properly tuned the following should also be done to insure satisfactory performance and economy



(a) Float level must be set as above

(b) Step-up rod in step-up jet must seat and move freely When reassembling, jet must be screwed in tight against seat

(c) Step-up piston in body casting should not bind and must be free of dirt

(d) Main metering jet can be replaced with leaner than standard metering jets, for altitude

CAUTION· Do not attempt to gauge metering jets with drills These jets have been flow-tested to insure correct fuel flow

B-B DOWN-DRAFT CARBURETER—**MODEL D6H2**

CARBURETER SPECIFICATIONS

For Dodge Six Cylinder Engine: 3¼ Inch Bore, 4⅝ Inch Stroke

Dimensions: Flange size, 1½ inch S. A. E.
Throttle bore, 1-9/16 inch.
Main venturi, 1¼ inch I. D.

Float Setting: Top of float 5/64 inch plus or minus 1/64 inch below top surface of carbureter body casting.

Vents: Outside, none. Inside balance vent tube.

Gasoline Intake Needle: Size No. 44 (.086 inch) drill in needle seat.

Idle Orifice Tube: Jet size, .0276 inch. Idle passage air bleed (in air horn), size .065 inch. Restriction in body, size .056 to .057 inch diameter.

Idle Ports: Upper port, slot type; length .149 inch; width, .030 inch.
Top of port located .118 to .122 inch above top edge of valve with valve tightly closed.
Lower port: (For Idle Adjustment Screw) Size, .053 to .057 inch diameter.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture, turn screw out. Idle engine between 450-500 r.p.m.

Main Metering Jet: Calibrated to flow 287 cc per minute. (Do not gauge for size. If in doubt, replace with new part.)

Main Vent: Through diffuser (air bleed inside bowl) size .0315 inch drill.

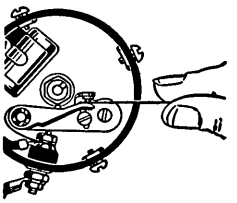
Main Vent Tube: Side holes, 6—.0354 inch diameter.

Step-Up Jet: Size .0295 inch diameter.

Accelerating Pump: Type, delayed action. Stroke, summer setting (inner hole, short stroke). Intermediate setting (center hole). Winter setting (outer hole, long stroke).
Pump intake passage, ball check seat, size .115 to .120 inch diameter.
Pump discharge passage; restriction (under ball check), size .062 to .065 inch diameter in body.
Pump (discharge) jet, size .0276 inch drill.

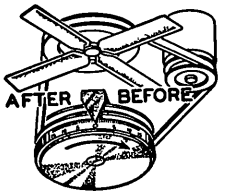
Pump Adjustment: 22/64" plunger travel (center hole). Use gauge No. T109-117S.

Choke: Butterfly type, with poppet valve. Inter-connected to open throttle valve to fast idle position when choke is used.

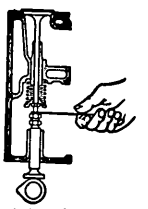


Vacuum Spark Port: Slot (round end) type. Size .040 by .110 inch. Bottom of port, .021 to .027 inch above top edge of valve with valve tightly closed.

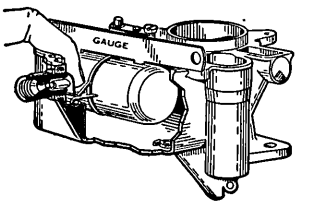
Motor Tune-Up—Be Accurate!



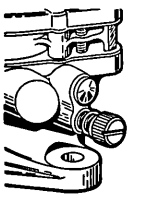
CAUTION: **Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.**



Spark Plug Gap .035"



Breaker Point Setting .020"



Ignition Timing Breaker Points to Open: 2° B. T. C.

Valve Setting (Hot) Intake .010" Exhaust .010"

Float Setting 5/64 Inch (Use Gauge T109-50)

Idle Adjustment Screw Setting ½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service, check float level. Wear on lip of float lever will raise float level. Before adjusting float, be sure float lever pin is firmly seated. Reset float level by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level. Bend vertical lip of float only.

If motor stalls while idling, set throttle lever adjusting screw so motor runs between 450-500 r.p.m. Then set idle adjustment screw to specifications. If these adjustments do not correct the trouble, remove idle orifice tube and plug assembly. Clean tube and passages with compressed air.

If acceleration is not satisfactory remove pump jet and clean with compressed air. However, it is usually advisable to replace the pump jet, as its cost is nominal. All jets must be seated gasoline tight. Poor acceleration may be due to damaged or worn plunger leather in accelerating pump, sediment in pump

PRINTED IN U.S.A.

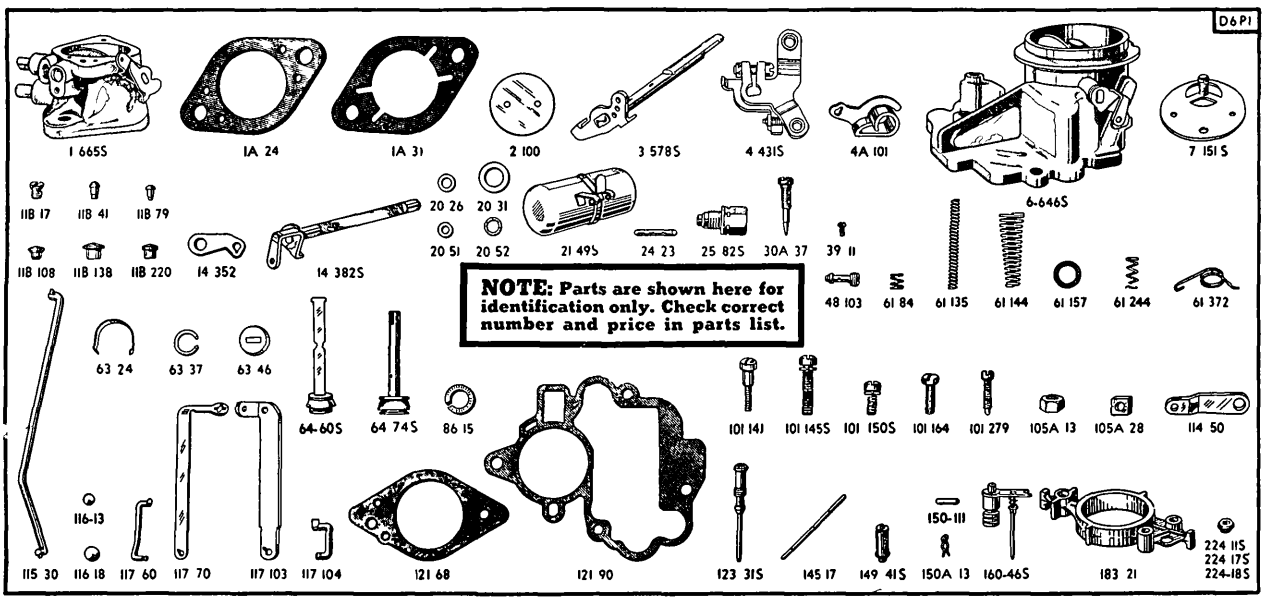
removed from cylinder, use care in installing to avoid damage to plunger leather

Correct air fuel ratio is provided by a 'balance tube" in the air horn The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner Should the cleaner become clogged, the capacity will be reduced but the air-fuel mixture ratio will not changed

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with tool No T109-43 main vent tube can be removed and a new tube inserted with tool No T109-195 Care must be exercised in inserting new tube which must seat tightly Use new rivet to complete the installation

Pump Adjustment Remove air horn assembly, back out throttle adjustment screw and be sure pump operating link is in center hole of throttle shaft arm Place universal pump travel gauge T109-117S on edge of bowl cover so that lip of gauge extends over top of plunger shaft Turn knurled nut of gauge until lip contacts top of plunger shaft with throttle valve seated Take reading indicated on gauge Repeat with throttle valve wide open and plunger pushed to bottom of cylinder The difference in reading obtained should be "22' (22/64") plunger travel



Adjust by bending horizontal portion of pump lifter link Pump stroke adjustable for high or low temperatures Set to longest stroke for cold weather, shorter stroke for hot weather driving

Dash-Pot Adjustment· Engines operating in connection with fluid couplings frequently tend to stall during rapid deceleration unless the throttle closes slowly Slow throttle movement is necessary only during the last part of the closing The dash-pot or decelerating pump acts as a snubber to the throttle, allowing fast movement to almost closed position, then slow closing from that point to the idle position

When the throttle is released, the throttle valve closes rapidly until throttle shaft arm contacts the dash-pot pick-up arm Then the dash-pot plunger must be pushed to the bottom of the cylinder before the throttle can close A ball check located in the lower end of the plunger shaft seals the larger upper opening and the gasoline must leave the cylinder through the small metered hole in lower part of the shaft

This reduces the rate at which plunger can be forced to the bottom of the cylinder making the last part of the throttle closing very slow **The adjusting screw (in top of bowl cover) should be opened five turns for D6P1 or 4½ turns for D6P2 from closed position** for average conditions Under extreme driving conditions greater openings may be necessary, although extreme dash-pot action will affect gear changes, and not enough action will allow engine to stall

Be sure plunger leather is soft and pliable and effects a good seal against the cylinder wall

Dodge Carbureters Nos. D6P1-D6P2—1949-1953

1949-1953

B-B DOWN-DRAFT CARBURETER—**MODEL D6M1**

CARBURETER SPECIFICATIONS

For Dodge Six Cylinder Engine: 3¼ Inch Bore, 4⅝ Inch Stroke

Dimensions: Flange size, 1½ inch S. A. E.
Throttle bore, 1-9/16 inch (39.69 mm).
Main venturi, 1¼ inch (31.75 mm) I. D.

Float Setting: Top of float 5/64 inch (1.98 mm) plus or minus 1/64 inch (.397 mm) below top surface of carbureter body casting.

Vents: Outside, none. Inside balance vent .218 inch (5.54 mm) diameter.

Gasoline Intake Needle: Triangular, horizontal. No. 44 (2.18 mm) drill in needle seat.

Idle Orifice Tube: Jet size, .0276 inch (.70 mm). Idle passage air bleed (in air horn), size .065 inch (1.65 mm). Restriction in body, size .054 to .055 inch (1.37 to 1.39 mm) diameter.

Idle Ports: Upper port, slot type; length .149 inch (3.789 mm); width, .030 inch (.76 mm).
Top of port located .118 to .122 inch (2.997 to 3.099 mm) above top edge of valve.
Lower port: (For Idle Adjustment Screw) Size, .053 to .057 inch (1.35 to 1.45 mm) diameter.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture turn screw out. With gear shift lever in neutral position, idle engine between 450 to 500 r.p.m.

Main Metering Jet: Calibrated to flow 256 cc per minute. (Do not gauge for size. If in doubt, replace with new part.)

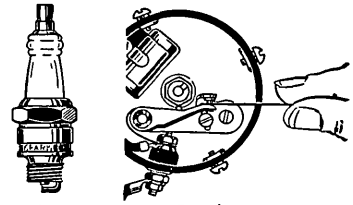
Main Vent: Through diffuser (air bleed inside bowl) size .0315 inch (.80 mm) drill.

Main Vent Tube: Side holes, 6—.0354 inch diameter.

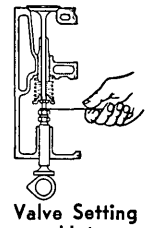
Step-Up Jet: No. 65 (.89 mm) drill size.

Accelerating Pump: Type, delayed action. Stroke, summer setting (inner hole, short stroke). Intermediate setting (center hole). Winter setting (outer hole, long stroke).
Pump intake passage, ball check seat, size .115 to .120 inch (2.93 to 3.05 mm) diameter.
Pump discharge passage; restriction (under ball check), size .062 to .065 inch (1.58 to 1.65 mm) diameter in body.
Pump (discharge) jet, size .0276 inch (.70 mm) drill.

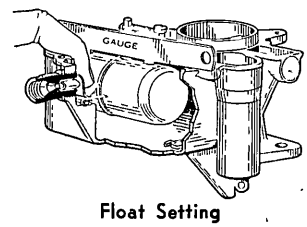
Pump Adjustment: 22/64" (8.731 mm) plunger travel (center hole). Use gauge No. T109-117S.



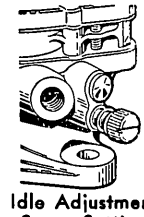
Choke: Butterfly type, with poppet valve. Inter-connected to open throttle valve to fast idle position when choke is used.



Slow Closing Throttle: Dash pot with discharge (By-pass), size .0197 inch (.5 mm) drill, through valve cage.



Vacuum Spark Port: Slot (round end) type. Size .040 by .110 inch (1.016 to 2.794 mm). Bottom of port, .021 to .027 inch (.553 to .686 mm) above top edge of valve.



Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap	Breaker Point Setting	Ignition Timing Breaker Points to Open:	Valve Setting Hot	Float Setting (Use Gauge)	Idle Adjustment Screw Setting
.038"	.020"	T. D. C.	Intake .008" Exhaust .010"	5/64 Inch	½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service, check float level. Wear on lip of float lever will raise float level. Before adjusting float, be sure float lever pin is firmly seated. Reset float level by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level. Bend vertical lip of float only.

If motor stalls while idling, set throttle lever adjusting screw so motor runs 450-500 r. p. m. Then set idle adjustment screw to specifications. If these adjustments do not correct the trouble, remove idle orifice tube and plug assembly. Clean tube passages with compressed air.

If acceleration is not satisfactory, remove pump jet and clean with compressed air. However, it is usually advisable to replace the pump jet as its cost is nominal. All jets must be seated gasoline tight. Poor acceleration may be due to damaged or worn plunger leather in accelerating pump,

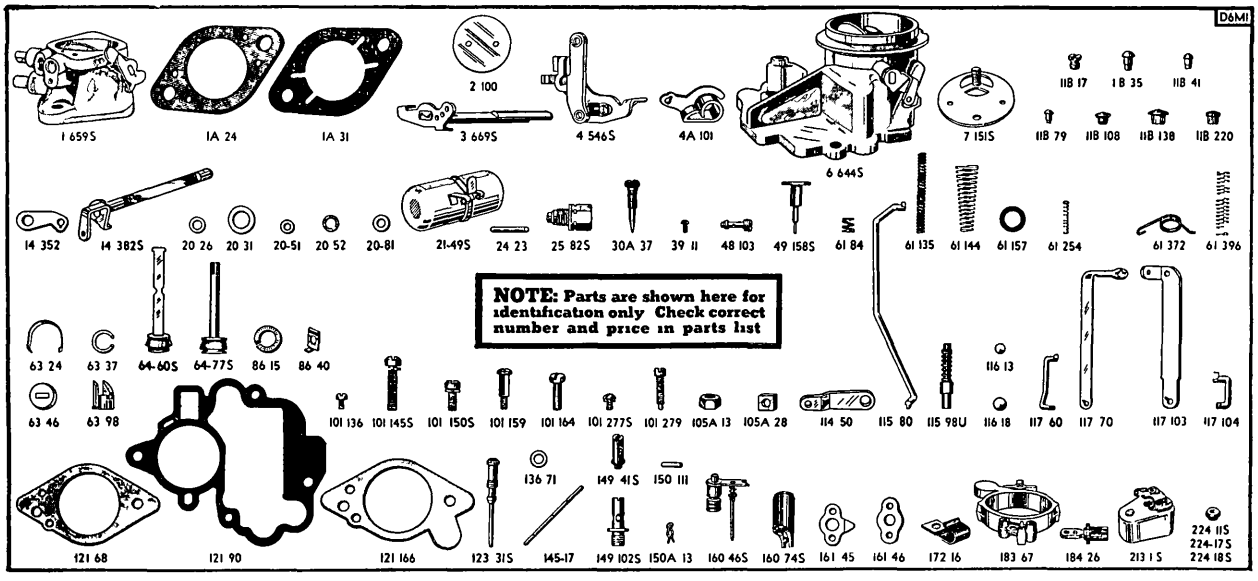
CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.



sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather

Correct air fuel ratio is provided by a balance tube' in the air horn The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner Should the cleaner become clogged, the capacity will be reduced but the air-fuel mixture ratio will not be changed

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with tool No T109-43, main vent tube can be removed and a new tube inserted with tool No T109-195 Care must be exercised in inserting new tube which must seat tightly Use new rivet to complete the installation

Pump Adjustment. Remove air horn assembly, back out throttle adjustment screw and place pump operating link in center hole of throttle shaft arm Place gauge T109-117S on edge of bowl cover so that lip of gauge extends over top of plunger shaft Turn knurled nut of gauge until lip contacts plunger shaft at closed and wide open throttle positions Difference in readings obtained should be "22 ' (22/64" plunger travel) Adjustments can be made by bending horizontal portion of pump connector link

Pump stroke adjustable for high or low temperature Set to long stroke for cold weather, short stroke for hot weather driving

Dodge Six—1949-1953—No. D6MI

DODGE TRUCK 1949-1952

2¾, 3, 3½ and 4 Ton

BB DOWN-DRAFT CARBURETERS—**E7U1-E7U2**

(Two carbureters per engine)

DODGE TRUCK, MODELS T-190, T-320, T-322, T-324, T-325

CARBURETER SPECIFICATIONS

For Dodge Truck Six Cylinder Engines
T190 T324 and T325 4 Inch Bore, 5 Inch Stroke
T320 3¾ Inch Bore 4⅝ Inch Stroke
T322 and T323 3¾ Inch Bore, 5 Inch Stroke

Dimensions Flange size 1½ inch (38 1 mm)
Throttle bore 1 11/16 inch (42 86 mm)
Main venturi 1 11/32 inch (34 13 mm) I D

Float Setting See Adjustments

Vents Outside none Inside balance vent tube 218 inch diameter (5 54 mm)

Gasoline Intake Needle Triangular horizontal No 44 (2 18 mm) drill in needle seat

Idle Orifice Tube Jet size (E7U1) 0276 inch (70 mm) drill (E7U2) 0295 inch (75 mm) drill Idle passage air bleed in air horn size (E7U1) 0465 inch (1 18 mm) diameter (E7U2) 057 inch (1 45 mm) diameter Restriction in body size (E7U1) 0452 inch (1 15 mm) diameter (E7U2) 0531 inch (1 35 mm) diameter

Idle Ports Upper port Slot type length 149 inch (3 78 mm) width 030 inch (76 mm) Top of port located 118 to 122 inch (3 00 to 3 10 mm) above top edge of valve Lower port size 053 to 057 inch (1 35 to 1 45 mm) drill (For idle adjustment screw)

Set Idle Adjustment Screw ½ to 1½ turns open For richer mixture turn screw out Do not idle engine under 400 r p m

Main Metering Screw Calibrated to flow 315 to 319 cc per minute (Do not gauge for size If in doubt replace with new part)

Main Vent Through diffuser (air bleed inside bowl) Size 0315 inch (80 mm) drill

Main Vent Tube Side hole 6— 0354 inch diameter

Step-Up Jet Power orifice 0394 inch (1 00 mm) drill

Accelerating Pump Type—delayed action seasonal adjustment Stroke—Summer setting (inner hole short stroke) Intermediate setting (center hole) Winter setting (outer hole long stroke) Pump intake passage ball check seat size 115 to 120 inch (2 93 to 3 05 mm) diameter in body Pump discharge passage Restriction (under ball check) size 062 to 065 inch (1 58 to 1 65 mm) diameter in body Pump (discharge) jet size 0374 inch (90 mm) drill

Pump Adjustment 26/64 inch plunger travel—full throttle position medium stroke Use gauge T109 117S

Choke Offset butterfly type with poppet valve

Vacuum Spark Port Slot (round end) type size 040 by 110 inch (1 016 by 2 794 mm) (E7U1) Top of port 052 to 058 inch (1 32 to 1 47 mm) above top edge of valve (E7U2) Bottom of port 012 to 018 inch (305 to 457 mm) above top edge of valve

MOTOR TUNE-UP

Spark Plug Gap	Set Breaker Points	Use Motor Gauge Breaker Points to Open	Set Valves	Float Setting (Use Gauge T109 50)	Idle Adjustment Screw Setting
T190 .038" T320, T322, T324, T325 .035"	.020"	T322, T323 T D C T320 1° A T D C T190, T324, T325 2° A T D C	Hydraulic Tappets (No Adjustments)	Solid Needle—5/64 Inch Spring Loaded Needle— See Adjustments	½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

FLOAT SETTING When using a spring loaded needle and seat, place a .050 feeler gauge between lip of float and intake needle pin With intake needle spring fully compressed, top of float should be 5/64 inch (1 98 mm) (gauge T109-50) below top surface of carbureter body casting Adjust by bending lip on float

When using a solid needle, the distance from the top of float, should be 5/64 inch (1 98 mm) (gauge T109-50), plus or minus 1/64 inch (397 mm) below top surface of carbureter body casting DO NOT USE FEELER GAUGE

PUMP ADJUSTMENT. Remove air horn assembly, back out throttle adjustment screw, and place pump operating link in center hole of throttle shaft arm Adjustment can be made by bending horizontal portion of pump lifter link so that top of pump plunger shaft contacts lip of indicator on pump stroke gauge T109-117S Correct travel is 26/64'

PUMP STROKE adjustable for high or low temperature Set to longest stroke for cold weather, shorter stroke for hot weather driving

RECOMMENDED PROCEDURE FOR SETTING IDLE

1 Back out idle speed screw on rear carb (fully closed throttle)
2 Adjust idle speed screw on front carb to give 400 r p m
3 Adjust idle mixture on front carb to best operation and readjust idle speed if necessary
4 Back out idle speed screw on front carb two full turns (or whatever is necessary to insure closed throttle)
5 Adjust idle speed screw on rear carb to give 400 r p m
6 Adjust idle mixture screw on rear carb to give best operation and readjust idle speed if necessary
7 Turn in idle speed screw on front carb same number of turns as in step No 4

This should result in balancing the two carbureters Any further adjustment to idle speed or mixture should be made by turning the screws the same amount on each carbureter

1948-1949

(6N2 can also be used)

B-B UP-DRAFT CARBURETER—**No. 6M1**

CARBURETER SPECIFICATIONS

For Dodge Six Cylinder Engine: 3-7/16 Inch Bore, 4¼ Inch Stroke (T152)

For Dodge Six Cylinder Engine: 3-7/16 Inch Bore, 4½ Inch Stroke (T154)

Dimensions: Flange size, 1½ inch (38.10 mm).
Throttle bore, 1-7/16 inch (38.51 mm).
Main venturi, 1⅛ inch I. D. (28.58 mm).
Air bleed through venturi to idle passage .0885 to .0905 inch diameter (2.25 to 2.30 mm) drill.

Float Setting: Distance from top of float to top surface of lower body casting 1/32 to 1/16 inch (.79 to 1.59 mm).

Vent: To float chamber size, No. 30 (3.26 mm) drill.

Balance Vent Tube: Inside diameter, 7/32 inch (5.56 mm). Restriction hole, upper body 5/32 inch (3.97 mm) diameter.

Gasoline Intake Needle: Triangular, horizontal. No. 44 (2.18 mm) drill in needle seat.

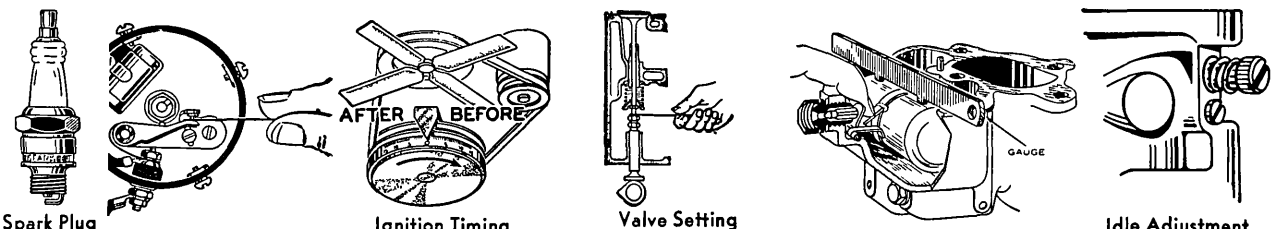
Idle Jet Tube: Jet size, .0236 inch (.60 mm) drill.

Idle Ports: Lower port size: .062 to .064 inch (1.58 to 1.63 mm) diameter.
Top of port located .005 to .009 inch (.13 to .23 mm) below lower edge of valve. Upper port size: .053 to .057 inch (1.35 to 1.45 mm) diameter (for idle adjustment screw).

Set Idle Adjustment Screw: ½ to 1 turn open. For richer mixture, turn screw out. Do not idle engine below 300 r.p.m. or 6 m.p.h.

Main Metering Screw: Calibrated to flow 316 to 320 cc per minute. (Do not gauge for size. If in doubt, replace with new part.)

Nozzle: Discharge jet size, No. 33 (2.87 mm) drill.
Side holes: 2—.0394 inch (1.00 mm) drill 1/16 inch (1.59 mm) from shoulder.
1—.051 inch (1.3 mm) drill ⅜ inch (9.525 mm) from shoulder.
1—.063 inch (1.6 mm) drill 23/32 inch (18.256 mm) from shoulder.
1—.051 inch (1.3 mm) drill 1-1/16 inch (26.99 mm) from shoulder.



Air Bleed to Nozzle: (Vent tube) Size, .0394 inch (1.00 mm) drill.

Step-Up Jet: (Power Orifice) Size, .0472 inch (1.20 mm) drill.

Accelerating Pump: Type, low pressure, delayed action. Stroke: Summer setting (inner hole, short stroke) 9/16 inch (14.29 mm).
Winter setting (outer hole, long stroke) 1 inch (25.40 mm).
Pump intake ball check: Size ⅛ inch (3.175 mm).
Pump discharge (through nozzle).

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .028"-.032" (Std.) .038" (Resistor)

Breaker Point Setting .020"

Ignition Timing Breaker Points to Open: T.D.C. (T152) 2° A.T.D.C. (T154)

Valve Setting (Hot) Intake .010" Exhaust .014" (T152) .018" (T154)

Float Setting (Use Gauge) 1/32 to 1/16

Idle Adjustment Screw Setting ½ to 1 Turn Open

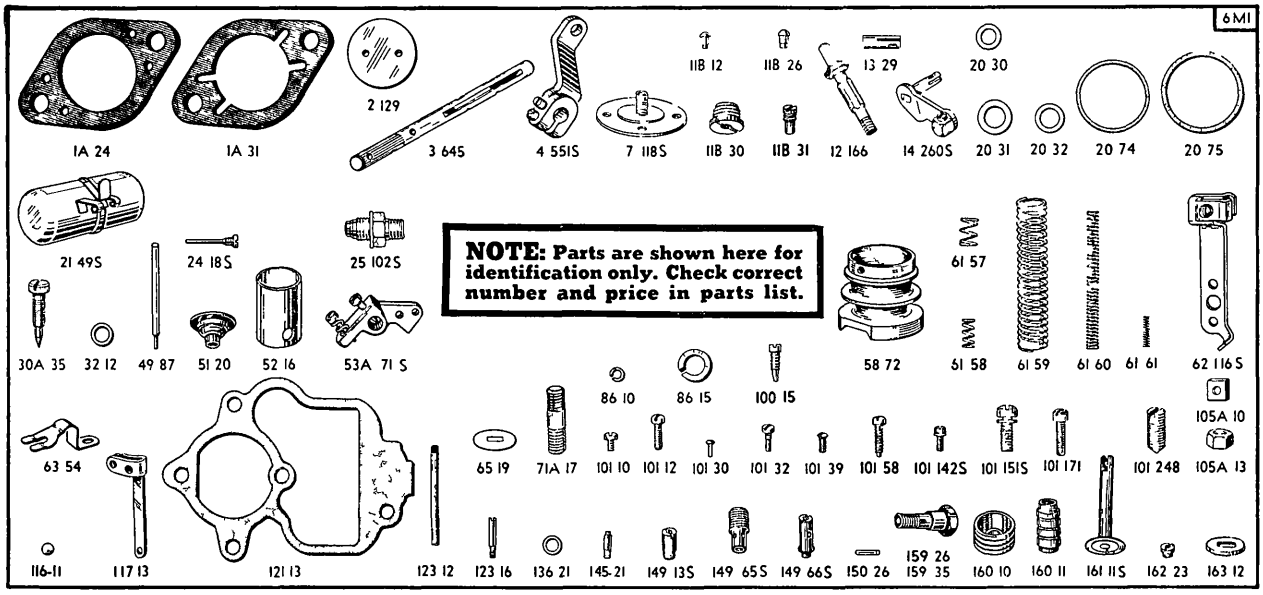
CARBURETER ADJUSTMENTS

To Secure a Good Idle: Set throttle lever adjusting screw so motor runs approximately 300 r.p.m. Then set idle adjustment screw so motor fires evenly. Correct setting will be found between ½ to 1 turn open. A richer mixture is obtained by backing out adjustment screw—a leaner mixture by turning screw in. If motor stalls while idling, remove idle passage tube and idle jet tube and clean with compressed air.

To Improve Acceleration: Examine pump link setting: For winter driving, link screw should be set in outer hole, giving long stroke, for hot weather, in high altitudes, pump link should be connected in inner hole, giving short stroke. If this does not give desired results, the main metering jet, pump metering jet, check valve assembly and pump valve assembly should be removed and cleaned with compressed air.

If Motor Loads—Check Float Level: Wear on lip of float lever will raise float level from factory setting, causing carbureter to load up. To lower float level, bend lip of float lever toward needle. To raise float level, bend lip away from needle. A very slight bend is sufficient. Be sure to bend lip of float, not bracket.



Economy: (a) Maximum economy is secured only when breaker points, spark plugs, valves and motor timing are set to manufacturer's specifications.

(b) Float level must set as instructed on page 1.

(c) Step-up valve cage assembly should be examined. Ball check in this assembly must seat and move freely. When reassembling valve cage must be screwed in tight against seat.

(d) Step-up push rod must move freely in upper and lower guides.

(e) Step-up piston in upper casting should not bind and must be free from dirt.

Dodge Carbureter No. 6M1—1948-1949

WHEN SERVICING, USE GASKET ASSORTMENT No. 172A; REPAIR PACKAGE No. 1597

BB DOWN-DRAFT CARBURETER WITH GOVERNOR—**E7B1**

Vehicle Model Nos.: B-1-T, F-1-T, S-1-T, B-1-V, F-1-V, S-1-V

Engine Symbol Nos.: T-158 and TX-158

Note: Motor Serial Nos. T158-1001 and higher

CARBURETER SPECIFICATIONS

Six Cylinder Engine 3¾ Inch Bore 5 Inch Stroke

Dimensions Flange size 1½ inch S A E
Throttle bore 1 11/16 inch (42 86 mm)
Main venturi 1 11/32 inch (3 413 mm)

Float Setting Top of float 5/64 inch (1 98 mm) plus or minus 1/64 inch (397 mm) below top surface of carbureter body casting

Vents Outside none Inside balance vent tube 218 inch (5 56 mm) inside diameter

Gasoline Intake Needle Triangular horizontal needle seat size No 44 (2 18 mm) drill

Idle Orifice Tube Jet size 0276 inch (70 mm)
Idle passage air bleed (in air horn) size 059 inch (1 50 mm)
Idle restriction in body size 055 inch (1 397 mm)

Idle Ports Upper port slot type Length 128 inch (3 251 mm) Width 027 inch (686 mm)
Top of port 104 inch (2 642 mm) to 110 inch (2 794 mm) above top edge of valve (in slot)
Lower port size 053 to 057 inch (1 35 to 1 45 mm) diameter (For idle adjustment screw)

Set Idle Adjustment ½ to 1½ turns open For richer mixture turn screw out Do not idle engine below 450 to 500 r p m motor speed

Vacuum Spark Port None

Main Metering Jet Calibrated to flow 328 to 332 cc per min ute Do not gauge for size If in doubt replace with new part

Main Vent Fuel chamber to vent tube well (in air horn) size 063 inch (1 60 mm) diameter In vent tube plug size 0433 (1 10 mm) diameter

Main Vent Tube Side holes 1—0354 (90 mm) d ameter 3/32 inch (2 381 mm) from end
1—0354" (90 mm) diameter ⅛ inch (3 175 mm) from end
1—0236" (60 mm) diameter ½ inch (12 70 mm) from end
1—0236" (60 mm) diameter 17/32 inch (13 49 mm) from end
1—0157" (40 mm) diameter 1 15/32 inch (37 31 mm) from end

Step Up Jet Size 0492 (1 25 mm) diameter

Accelerating Pump Type vacuum operated Stroke non ad justable Pump intake passage ball check seat size 115 to 120 inch (2 92 to 3 05 mm) diameter
Pump discharge passage ball check seat size 062 to 065 inch (1 58 to 1 65 mm) diameter
Pump discharge jet size 0315 inch (80 mm) d ameter

Choke Offset butterfly type with poppet valve

FOR GOVERNOR INSTRUCTIONS, SEE FORM 4718F

MOTOR TUNE-UP

Spark Plug Gap	Set Breaker Points	Use Motor Gauge Breaker Points to Open	Set Valves (Hot)		Idle Adjustment Screw Setting
			Intake 010	Float Setting	½ to 1½
025"	020"	T D C	Exhaust 018"	5/64 Inch	Turns Open

CARBURETER ADJUSTMENTS

Correct float adjustment is important and should be made in the following way

Place float gauge (No T109 50) across the carbureter body Press float lever down to hold float pin against the bottom of the slot in the body casting Floats should just clear the projections on the gauge If adjustment is necessary, bend lip on float lever toward intake needle to lower level or away from the needle to raise the float level

If motor stalls while idling, set throttle lever adjusting screw so motor runs between 450 and 500 R P M Then set idle adjustment screw ½ to 1½ turns open from closed position If a vacuum gauge is available adjust to highest steady gauge reading

Accelerating pump is actuated by the intake manifold vacuum and no adjustment is necessary However, be sure the bowl cover gasket and flange gasket seal to prevent any air leaks to the pump vacuum passages

If engine misses when load is suddenly increased remove pump jet and clean with compressed air However, it is usually advisable to replace the pump jet as its cost is nominal (All jets must be seated gasoline tight) This con dition may also be due to damaged or worn plunger leather in accelerating pump cylinder or discharge check in discharge passage If plunger is removed from cylinder use care when installing to avoid damage to plunger leather

Correct air fuel ratio is provided by a 'balance tube in the air horn The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type size or condition of air cleaner Should the cleaner become clogged the capacity will be reduced but the air-fuel mixture ratio will not be changed

NOTE Figures in parentheses indicate number of pieces used in one carbureter Where no figure is shown, only one is used

DODGE TRUCK 1947-1949

BB DOWN-DRAFT CARBURETER WITH GOVERNOR—**E7F1**

MODEL NUMBERS: **WDX, B-1-PW, F-1-PW**

Note: Motor Serial Nos. T137-8219 and higher

CARBURETER SPECIFICATIONS

Six Cylinder Engine 3¼ Inch Bore, 4⅝ Inch Stroke

Dimensions Flange size 1½ inch S A E
Throttle bore 1 11/16 inch (42 86 mm)
Main venturi 1 11/32 inch (3 413 mm)

Float Setting Top of float 5/64 inch (1 98 mm) plus or minus 1/64 inch (397 mm) below top surface of carbureter body casting

Vents Outside none Inside balance vent tube 218 inch (5 56 mm) inside diameter

Gasoline Intake Needle Triangular horizontal needle seat size No 44 (2 18 mm) drill

Idle Orifice Tube Jet size 0276 inch (70 mm)
Idle passage air bleed (in air horn) size 059 inch (1 50 mm)
Idle restriction in body size 055 inch (1 397 mm)

Idle Ports Upper port slot type Length 128 inch (3 251 mm) Width 027 inch (686 mm)
Top of port 104 inch (2 642 mm) to 110 inch (2 794 mm) above top edge of valve in slot (early production) 096 inch (2 388 mm) to 100 inch (2 540 mm) above top edge of valve in slot (late production)
Lower port size 053 to 057 inch (1 35 to 1 45 mm) diameter (For idle adjustment screw)

Set Idle Adjustment ½ to 1½ turns open For richer mixture turn screw out Do not idle engine below 450 to 500 r p m motor speed

Vacuum Spark Port None

Main Metering Jet Calibrated to flow 328 to 332 cc per minute Do not gauge for size If in doubt replace with new part

Main Vent Fuel chamber to vent tube well (in air horn) size 063 inch (1 60 mm) diameter In vent tube plug size 0433 (1 10 mm) diameter

Main Vent Tube Side holes 1—0354 (90 mm) diameter 3/32 inch (2 381 mm) from end

1—0354 (90 mm) diameter ⅛ inch (3 175 mm) from end
1—0236 (60 mm) diameter ½ inch (12 70 mm) from end
1—0236 (60 mm) diameter 17/32 inch (13 49 mm) from end

1—0157 (40 mm) diameter 1 15/32 inch (37 31 mm) from end

Step Up Jet Size 0492 (1 25 mm) diameter

Accelerating Pump Type vacuum operated Stroke non adjustable Pump intake passage ball check seat size 115 to 120 inch (2 92 to 3 05 mm) diameter
Pump discharge passage ball check seat size 062 to 065 inch (1 58 to 1 65 mm) diameter
Pump discharge jet size 0315 inch (80 mm) diameter

Choke Offset butterfly type with poppet valve

FOR GOVERNOR INSTRUCTIONS, SEE FORM 4718F

MOTOR TUNE-UP

Spark Plug Gap	Set Breaker Points	Use Motor Gauge Breaker Points to Open	Set Valves (Hot)		Idle Adjustment Screw Setting
025"- 030'	018"- 024"	002" A T D C	Intake 008" Exhaust 010"	Float Setting 5/64 Inch	½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

Correct float adjustment is important and should be made in the following way

Place float gauge (No T109-50) across the carbureter body Press float lever down to hold float pin against the bottom of the slot in the body casting Floats should just clear the projections on the gauge If adjustment is necessary, bend lip on float lever toward intake needle to lower level or away from the needle to raise the float level

If motor stalls while idling, set throttle lever adjusting screw so motor runs between 450 and 500 R P M Then set idle adjustment screw ½ to 1½ turns open from closed position If a vacuum gauge is available, adjust to highest steady gauge reading

Accelerating pump is actuated by the intake manifold vacuum and no adjustment is necessary However be sure the bowl cover gasket and flange gasket seal to prevent any air leaks to the pump vacuum passages

If engine misses when load is suddenly increased, remove pump jet and clean with compressed air However, it is usually advisable to replace the pump jet, as its cost is nominal (All jets must be seated gasoline tight) This condition may also be due to damaged or worn plunger leather in accelerating pump cylinder or discharge check in discharge passage If plunger is removed from cylinder, use care when installing to avoid damage to plunger leather

Correct air fuel ratio is provided by a 'balance tube in the air horn The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner Should the cleaner become clogged, the capacity will be reduced but the air-fuel mixture ratio will not be changed

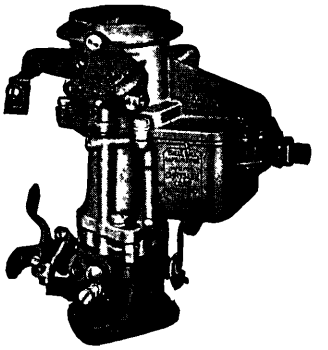
PARTS LIST

WHEN SERVICING, USE GASKET ASSORTMENT No. 205, REPAIR PACKAGE No. 1503



PART NAMES IN CAPITAL LETTERS, LISTED BELOW, INDICATE CONTENTS OF REPAIR PACKAGE

Part No	PART NAME	
1-587S	Body flange and governor assembly	
1A-31	FLANGE GASKET	
3 585S	Throttle lever shaft and arm assembly	
4-506S	Throttle lever assembly	
4A-96	Throttle shaft dog	
4A-103S	Throttle shaft dog assembly	
6-582S	Air horn assembly	
7-105S	Choke valve assembly	
11B-17	PUMP DISCHARGE PASSAGE PLUG	
11B-41	Rivet plug	(4)
11B-69	Rivet plug	
11B-79	Rivet plug	
11B-108	Idle port rivet plug	
11B-138	PUMP JET RIVET PLUG	
11B-186S	Governor primary adjusting screw plug assembly	
11B-194	Bowl drain plug	
11B-201S	Governor secondary adjusting screw plug assembly	
11B-220	HIGH SPEED PASSAGE PLUG	
14-357S	Choke shaft and lever assembly	
20-26	Main metering jet gasket	
20-31	NEEDLE SEAT GASKET	
20-35	Governor primary adjusting screw plug gasket	
20-36	Governor secondary adjusting screw plug gasket	
20 51	Step up jet gasket	
20-52	STEP UP PISTON GASKET	
21-91S	Float and lever assembly	
24-23	FLOAT LEVER PIN	
25-102S	NEEDLE AND SEAT ASSEMBLY	
30A-37	Idle adjustment screw	
38A-57S	Adjusting nut assembly (Stamped No 27)	
39-10	Choke valve attaching screw	(2)
48-73	PUMP JET	
61-84	Idle adjustment screw spring	
61-135	STEP UP PISTON SPRING	
61-144	Pump spring	
61 157	Plunger spring	
61-299	Choke spring	
61-302	Secondary friction spring	
61-314S	Secondary spring assembly	
61-366	Governor primary spring (Cadmium plate .041" wire dia.)	
61-373	Pump spring (Altitude operation only)	
62-151S	Choke tube bracket assembly	
63-24	Float lever pin retainer	
63-37	Pump retainer ring	
63-85	Secondary adjusting screw retainer	
63-104	Throttle shaft retaining ring (Sup by 136 55)	
64-117S	PLUNGER ROD SPRING AND PISTON ASSEMBLY	
64-118S	Plunger rod spring and piston assembly (Altitude operation only)	
86 9	Lock washer	
86-10	Lock washer	
86-15	Flange stud lock washer	
86-17	Throttle stop screw lock washer	
86-51	Throttle shaft dog lock washer	
86-54	Throttle valve screw lock washer	(2)
101-10	Wire clamp screw	
101-12	Choke bracket clamp screw	
101-38	Screw	
101-142S	Choke tube bracket attaching screw and washer assembly	
101-145S	Body flange attaching screw and washer assembly	(2)
101-149S	Throttle shaft housing attaching screw and washer assembly	(3)
101-150S	Air horn attaching screw and washer assembly	(3)
101-160S	Cover to governor housing attaching screw and washer assembly	(6)
101-164	Throttle lever clamp screw	
101-199S	Air horn attaching screw and washer assembly	(2)
101-215	Secondary adjusting screw	
101-220	Primary adjusting screw (Stamped No 27 1 19/32" long)	
101-231	Throttle shaft dog attaching screw	
101-232	Throttle valve screw	(2)
101-234S	Body flange attaching screw and washer assembly	
101-246	Throttle adjusting screw	
101-248	Throttle lever set screw	
101-249	Clamp screw	
101-257	Throttle stop screw	
103-11	Lead shot	(2)
105A-10	Choke tube clamp nut	
105A-13	Flange nut	
105A-28	Throttle lever clamp nut	
116-13	PUMP INTAKE CHECK BALL	
116-18	PUMP DISCHARGE CHECK BALL	
118-58	Governor housing cover	
118-60S	Governor housing cover assembly (Sup by 118 58)	
121-104	MAIN BODY GASKET	
121-114	BODY FLANGE GASKET	
121-123	Governor housing cover gasket	
121-141	THROTTLE SHAFT HOUSING GASKET	
123-47S	IDLE ORIFICE TUBE AND PLUG ASSEMBLY	
136-55	SPRING WASHER (BETWEEN THROTTLE LEVER AND CASTING)	
136-82	MAIN VENT PLUG GASKET	
136-124	Spring washer (Sup by 63 104)	
145 51S	MAIN VENT TUBE AND PLUG ASSEMBLY	
149-99S	STEP UP JET ASSEMBLY	
159-63S	Main metering jet assembly—3 sizes lean	
159-87S	Main metering jet assembly—2 sizes lean	
159-89S	Main metering jet assembly—1 size lean	
159-93S	MAIN METERING JET ASSEMBLY—STANDARD	
160-78S	STEP UP PISTON PLATE AND ROD ASSEMBLY	
163-37	Car seal	(2)
170-143S	Shaft housing assembly	

NOTE Figures in parentheses indicate number of pieces used in one carbureter Where no figure is shown only one is used.

DTC1 Used on "T112-T113-T125"
ETT1 Used on "T118 and T120"

MOTOR SERIAL NUMBERS
DTC1—P14—1001 and higher
ETT1—1001 and higher

DODGE TRUCKS 1942-49

(DTE2 can be used in place of DTC1, E7T2 can be used in place of ETT1)

Casting number on face of flange DTC1, 242, ETT1, 271

B-B Down-Draft Carbureters—**Models DTC1-ETT1**

CARBURETER SPECIFICATIONS

DTC1 for Engines T112-T113-T125. 3¼" Bore; 4⅜" Stroke
ETT1 for Engines T118-T120. 3-7/16" Bore; 4½" Stroke.

Dimensions (Both) Flange size, 1½ inch S A E
(DTC1) Throttle bore, 1-9/16 inch (39 69 mm)
(ETT1) Throttle bore, 1-11/16 inch (42 86 mm)
(DTC1) Main venturi, 1¼ inch (31 75 mm)
(ETT1) Main venturi 1-11/32 inch (34 13 mm)

Float Setting (Both) Top of float 5/64 inch (1 98 mm) plus or minus 1/64 inch (397 mm) below top surface of carbureter body casting

Vents: (Both) Outside, none Inside, balance vent 218 inch (5 54 mm) diameter

Gasoline Intake Needle. (Both) Triangular, horizontal No 44 (2 18 mm) drill in needle seat

Idle Orifice Tube. (DTC1) Jet size 0295 inch (75 mm)
(ETT1) Jet size, 0276 inch (70 mm)
(DTC1) Idle passage air bleed (in body) size 067 inch (1 70 mm)
(ETT1) Idle passage air bleed (in body) size 063 inch (1 60 mm)
(DTC1) Restriction (in body) size 054-055 inch (1 371-1 397 mm)
(ETT1) Restriction (in body) size 053 inch (1 346 mm)

Idle Ports (DTC1) Upper port keyhole type, length, 160 inch (4 06 mm) Width 030 inch (76 mm), 045 inch (1 14 mm) diameter hole at top Top of port located (early production) 118 to 122 inch, (late production) 128 to 132 inch above top edge of valve
(ETT1) Upper port, keyhole type, length, 128 inch (3 25 mm) Width, 027 inch (686 mm), 063 inch (1 6 mm) diameter hole at top Top of port located 088 to 092 inch (2 24 to 2 34 mm) above top edge of valve (early production), 093 to 097 inch (2 36 to 2 46 mm) above top edge of valve (late production)
(Both) Lower port size 053 to 057 inch (1 35 to 1 45 mm) diameter (For idle adjustment screw)

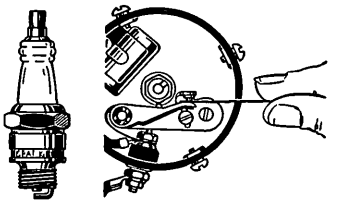
Set Idle Adjustment Screw (Both) ½ to 1½ turns open For richer mixture, turn screw out Do not idle engine below 300 r p m or 6 m p h

Main Metering Jet: (DTC1) Calibrated to flow 254 to 258 cc per minute
(ETT1) Calibrated to flow 312 to 316 cc per minute Do not gauge for size If in doubt, replace with new part

Main Vent: (Both) Through diffuser (air bleed inside bowl) size, 0315 inch (80 mm) drill

Accelerating Jets (DTC1) 2—0354 (90 mm) drill approximately 5/16 inch (7 94 mm) from end
2—0354 (90 mm) drill approximately 1 inch (25 40 mm) from end
2—0354 (90 mm) drill approximately 1½ inch (38 10 mm) from end
(ETT1) 2—0354 (90 mm) drill approximately 5/16 inch (7 94 mm) from end
2—0354 (90 mm) drill approximately 1 inch (25 40 mm) from end

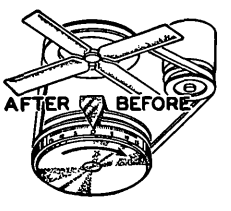
Step-up Jet (DTC1) No 63 (94 mm) drill
(ETT1) 0413 inch (1 05 mm) drill



Accelerating Pump. (Both) Type, delayed action Stroke, summer setting (inner hole, short stroke) Intermediate setting (center hole) Winter setting (outer hole, long stroke) Pump intake passage, ball check seat, size 115 to 120 inch (2 93 to 3 05 mm) diameter
Pump discharge passage Restriction (under ball check) size 062 to 065 inch (1 58 to 1 65 mm) diameter in body
(DTC1) Pump (discharge) jet, size 0276 inch (70 mm) drill
(ETT1) Pump (discharge) jet, size 0374 inch (95 mm) drill

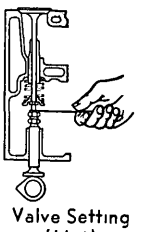
Choke Offset butterfly type with poppet valve

Vacuum Spark Port (Both) Slot type size, 040 by 110 inch (1 016 by 2 794 mm)
(DTC1) Bottom of port to be 003 to 009 inch (076 to 229 mm) above top edge of valve
(ETT1) Top of port to be 052 to 058 inch (1 321 to 1 473 mm) above top edge of valve

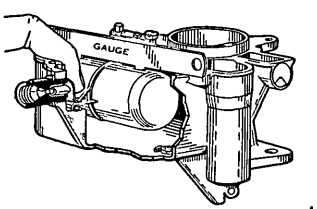


Motor Tune-Up—Be Accurate!

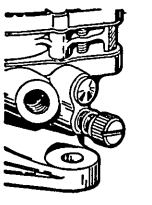
CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter



Spark Plug Gap .025"



Breaker Point Setting .020"



Ignition Timing Breaker Points to Open: T. D C.

Valve Setting (Hot)
T112-T113-T125
Int. .006"—Ex .008
T118-T120
Int. .010"—Ex .012"

Float Setting (Use Gauge) 5/64 Inch

Idle Adjustment Screw Setting ½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service, check float level Wear on lip of float lever will raise float level Before adjusting float, be sure float lever pin is firmly seated Reset float level by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level Bend vertical lip of float only

If motor stalls while idling, set throttle lever adjusting screw so motor runs approximately 300 r p m Then set idle adjustment screw to specifications If these adjustments do not correct the trouble remove idle orifice tube and plug assembly Clean tube and passages with compressed air

If acceleration is not satisfactory, remove pump jet and clean with compressed air However, it is usually advisable to replace the pump jet as its cost is nominal All jets must be seated gasoline tight Poor acceleration may be due to damaged or worn plunger leather in accelerating pump, sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather

Correct air fuel ratio is provided by a 'balance tube" in the air horn The balance tube should be checked each time

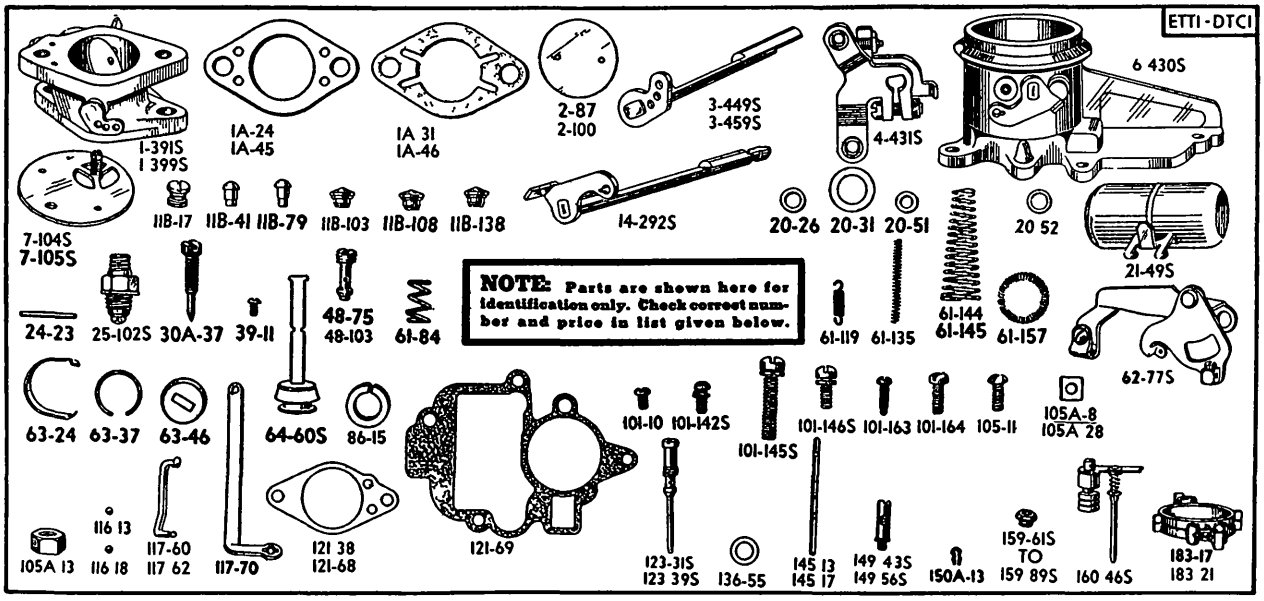
CARBURETER
TRADE MARK REG U S PAT. OFF.
MARCA REGISTRADA

PRINTED IN U S A

the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type size or condition of air cleaner Should the cleaner become clogged the capacity will be reduced but the air-fuel mixture ratio will not be changed

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with tool No T109-43 main vent tube can be removed and a new tube inserted with tool No T109-195 Care must be exercised in inserting new tube which must seat tightly Use new rivet to complete the installation



Pump Adjustment Remove air horn assembly back out throttle adjustment screw, and place pump operating link in center hole of throttle shaft arm Adjustment can be made by bending horizontal portion of pump lifter link so that top of pump plunger shaft contacts lip of indicator on pump stroke gauge T109-117S Correct travel is 24/64" on DTC1 and 26/64' on ETT1

Pump stroke adjustable for high or low temperature Set to longest stroke for cold weather, shorter stroke for hot weather driving

Maximum economy and performance are secured only when breaker points, spark plugs valves and motor timing are set to manufacturer s specifications After motor is properly tuned the following should be done to insure satisfactory performance and economy

(a) Float level must be set as above
(b) Step-up rod in step-up jet must seat and move freely When reassembling, jet must be screwed in tight against seat
(c) Step-up piston in body casting should not bind and must be free of dirt
(d) Main metering jet can be replaced with leaner than standard metering jets, for altitude or high test fuel

Caution Do not attempt to gauge metering jets with drills These jets have been flow-tested to insure correct fuel flow

Dodge Trucks—1942-49—Nos. DTC1-ETT1

WHEN SERVICING, USE GASKET ASSORTMENT No. 136 FOR DTC1, No. 137A FOR ETT1, REPAIR PACKAGE FOR ETT1, No. 1311C, FOR DTC1, No 1326D

★This gasket to be installed between carbureter and governor when governor is installed Original flange gasket to remain between governor and manifold

†Install 101-150S in bowl cover attaching screw to the rear of the air horn

NOTE· Figures in parentheses indicate number of pieces used In one carbureter Where no figure is shown, only one is used

DODGE TRUCKS CAB-OVER-ENGINE 1940-1948

CARBURETER INDEX

Year	Carbureter Numbers	Car Model
1940-41	†6C1-6C2	T88-T89
1940-41	†6D1	T88
1940-41	6D1R	Retail
1940-48	6E1	T90-T91-T128-T130
1941-42	6F1	T98-T128-T130
1941-42	6G1	T130

(6D1R can be used in place of 6C1-6C2-6D1)

† 6D1R Carbureter will be shipped on orders for 6C1, 6C2 or 6D1. The instructions below should be followed when 6D1R Carbureter is used to replace 6C1, 6C2 or 6D1.

6C1—Use the following parts which are packed in carton with carbureter:—4-238S, 4A-39S, and 62-118S.

6C2—No additional parts necessary.

6D1—Use 156-29 gas line connection which is packed in carton with carbureter.

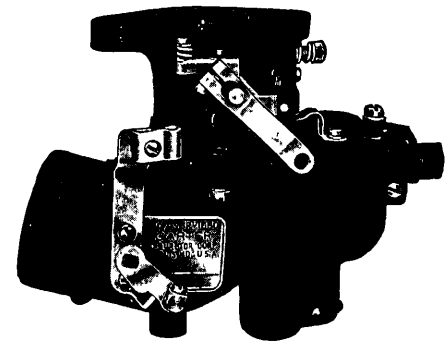

Figure shows 1940 Carbureter, No. 6C1.

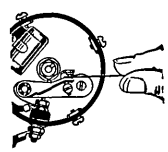

MOTOR TUNE-UP—BE ACCURATE! ALWAYS USE FEELER GAUGES!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

To Secure a Good Idle: Set throttle lever adjusting screw so motor runs approximately 300 rpm. Then set idle adjustment screw so motor fires evenly. Correct setting will be found between (1/4 to 1 1/4 on 6E1, 6F1) (1/2 to 1 1/2 on 6C1, 6C2, 6D1, 6D1R) turns open. A richer mixture is obtained by backing out adjustment screw—a leaner mixture by turning screw in. If motor stalls while idling, remove idle passage tube and idle jet tube and clean with compressed air.

To Improve Acceleration: Examine pump link setting: For winter driving, link screw should be set in outer hole, giving long stroke; for hot weather, in high altitudes, pump link should be connected in inner hole, giving short stroke. If this does not give desired results, the main metering jet, pump metering jet, check valve assembly and pump valve assembly should be removed and cleaned with compressed air.

If Motor Loads—Check Float Level: Wear on lip of float lever will raise float level from factory setting, causing carbureter to load up. To lower float level, bend lip of float lever toward needle. To raise float level, bend lip away from needle. A very slight bend is sufficient. Be sure to bend lip of float, not bracket.

Economy. (a) Maximum economy is secured only when breaker points, spark plugs valves and motor timing are set to manufacturer s specifications.

(b) Float level must set as instructed on page 1

(c) Step-up valve cage assembly should be ex amined Ball check in this assembly must seat and move freely. When reassembling valve cage must be screwed in tight against seat.

(d) Step-up push rod must move freely in upper and lower guides

(e) Step-up piston in upper casting should not bind and must be free from dirt.

Spark Plug Gap	Set Breaker Points	Use Motor Gauge Breaker Points to Open	Set Valves (Hot)	Float Setting	Idle Adjustment Screw Setting
024"-027"	018"-.022"	2° A T D C.	Intake 010" Exhaust 012"	5/64 Inch	(ET1-ET2) ⅝ to 1⅛ Turns Open (ET4) ¾ to 1¼ Turns Open

CARBURETER ADJUSTMENTS

Correct float adjustment is important and should be made in the following way

Place float gauge (No T109-50) across the carbureter body Press float lever down to hold float pin against the bottom of the slot in the body casting Floats should just clear the projections on the gauge If adjustment is necessary, bend lip on float lever toward intake needle to lower level or away from the needle to raise the float level

If motor stalls while idling, set throttle lever adjusting screw so motor runs between 450 and 500 R P M Then set idle adjustment screw (ET1-ET2) ⅝ to 1⅛, (ET4) ¾ to 1¼ turns open from closed position If a vacuum gauge is available, adjust to highest steady gauge reading

Accelerating pump is actuated by the intake manifold vacuum and no adjustment is necessary However be sure the bowl cover gasket and flange gasket seal to prevent any air leaks to the pump vacuum passages

If engine misses when load is suddenly increased remove pump jet and clean with compressed air However it is usually advisable to replace the pump jet, as its cost is nominal (All jets must be seated gasoline tight) This condition may also be due to damaged or worn plunger leather in accelerating pump cylinder or discharge check in discharge passage If plunger is removed from cylinder, use care when installing to avoid damage to plunger leather

Correct air fuel ratio is provided by a balance tube in the air horn The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner Should the cleaner become clogged the capacity will be reduced but the air-fuel mixture ratio will not be changed

A fuel filter is incorporated in the carbureter bowl casting It should be cleaned periodically by removing the filter bowl and element (small discs) Soak element in acetone or a mixture of half and half Ethyl Alcohol and Benzol until all foreign material dissolves Then allow to dry CAUTION—do not blow off with compressed air which may damage discs

WHEN SERVICING USE GASKET ASSORTMENT No 191, REPAIR PACKAGE No. 1370A

PART NAMES IN CAPITAL LETTERS LISTED BELOW INDICATE CONTENTS OF REPAIR PACKAGE

Part No	PART NAME	
1-481S	Body flange assembly (complete with 220 2 governor) (Sup by 1 587S)	
1-527S	Body flange assembly (complete with 220 4 governor) (Sup by 1 587S)	
1-587S	★Body flange assembly (complete with 220 6 governor)	
1A-31	FLANGE GASKET	
3 553S	Throttle lever shaft and arm assembly (ET1 2)	
3 585S	Throttle lever shaft and arm assembly (ET4)	
4-506S	Throttle lever assembly	
4A 96	Throttle shaft pickup dog	
4A 103S	Tnrottle shaft dog assembly	
6 523S	Air horn assembly (ET1 only) (When replacing use 6 549S)	
6 549S	Air horn assembly	
7 105S	Choke valve assembly	
11B 17	PUMP DISCHARGE PASSAGE PLUG	
11B 41	Rivet plug	(4)
11B 69	Rivet plug	
11B 79	Rivet plug	
11B 108	Idle port rivet plug	
11B 138	PUMP JET RIVET PLUG	
11B 186S	Governor primary adjusting screw passage plug assembly	
11B 194	Bowl drain plug	
11B 201S	Governor secondary adjusting screw passage plug assembly	
11B 206S	Needle seat plug assembly	
11B 214S	Filter bowl assembly	
11B 220	HIGH SPEED PASSAGE PLUG	
14 345S	Choke shaft and lever assembly (ET1) (Early production)	
14 357S	Choke shaft and lever assembly (6 549S)	
20 26	Main metering jet gasket	
20-35	Governor primary adj screw plug gasket	
20 36	Governor secondary adj screw plug gasket	
20 51	Step up jet gasket	
20 52	STEP UP PISTON GASKET	
20 70	Needle seat gasket	
20 90	FILTER BOWL GASKET	
20 91	NEEDLE SEAT PLUG GASKET	
21 98S	Float and lever assembly	
24-23	FLOAT LEVER PIN	
25 148S	NEEDLE AND SEAT ASSEMBLY	
30 44	Filter element (optional)	
30 52	Filter element (Sup by 30 55S)	
30 55S	Filter element	
30A 37	Idle adjustment screw	
38A 57S	★Adjusting nut assembly (Stamped No 27)	
39 10	Choke valve attaching screw	(2)
48 73	PUMP JET	
61 84	Idle adjustment screw spring	
61 135	STEP UP PISTON SPRING	
61-144	Pump spring (Cadmium plated)	
61-145	Pump spring (Copper plated) (Sup by 61 144)	
61 157	Plunger spring	
61 299	Choke spring	
61 302	★Friction spring	
61 314S	★Secondary spring assembly	
61 366	★Primary spring (Cadmium plated 041" wire diameter 23 coils)	
61 373	Pump spring (for altitude operation only) (Copper oxide plated)	
62-151S	Choke tube bracket assembly	
63-24	Float lever pin retainer	
63-37	Pump cylinder ball retainer	
63-85	★Secondary adjusting screw retainer	
63-104	Throttle shaft retaining ring	
64-93S	Pump plunger rod spring and piston assembly (Identify by copper plated spring) (Sup by 64 117S)	
64-117S	PUMP PLUNGER SPRING AND ROD ASSEMBLY (Identify by cadmium plated spring)	
64 118S	Plunger rod spring and piston assembly (for altitude operation only) (Identify by copper oxide plated spring)	

Part No	PART NAME	
36-9	Throttle stop screw lock washer (ET1 ET2)	
86-9	Throttle lever clamp screw lock washer	
86-10	Choke bracket attaching screw lock washer	
86-15	Flange stud lock washer	(2)
86-16	Throttle valve screw lock washer (Sup by 86 54)	(2)
86-17	Throttle stop screw lock washer (ET4)	
86-51	Throttle shaft dog lock washer	
86-54	Throttle valve screw lock washer	(2)
101-10	Wire clamp screw	
101-12	Choke bracket clamp screw	
101-38	Choke bracket attaching screw (long)	
101-121	Throttle adjusting screw (ET1 only) (Sup by 101 246)	
101-142S	Choke tube bracket attaching screw and washer assembly	
101-145S	Body flange attaching screw and washer assembly	(2)
101-149S	Throttle shaft housing attaching screw and washer assembly (ET4)	(3)
101-150S	Air horn attaching screw and washer assembly	(3)
101-160S	Cover to governor housing attaching screw and washer assembly	(6)
101-164	Throttle dog clamp screw	
101-199S	Air horn attaching screw and washer assembly (Hex head)	(2)
101-215	★Secondary adjusting screw	
101-216S	Throttle shaft housing attaching screw and washer assembly (ET1 2)	
101-217	Throttle stop screw (ET1 2)	
101-220	★Primary adjusting screw (No 27 1 19/32" long)	
101-231	Throttle shaft dog attaching screw	
101 232	Throttle valve attaching screw	(2)
101-234S	Body flange attaching screw and washer assembly (lower)	
101 244	Throttle lever set screw (ET1) (Sup by 101 248)	
101 246	Tnrottle adjusting screw	
101-248	Throttle lever set screw (headless)	
101-249	Throttle lever clamp screw	
101-257	Throttle stop screw (ET4)	
103 11	Lead shot	(2)
105A-10	Choke tube clamp nut	
105A-13	Flange nut	(2)
105A-28	Throttle shaft dog clamp nut	
116-13	PUMP INTAKE CHECK BALL	
116 18	PUMP DISCHARGE CHECK BALL	
118 60S	Governor housing cover assembly	
121-105	BOWL COVER GASKET	
121-114	BODY FLANGE GASKET	
121-123	Governor housing cover gasket	
121-125	THROTTLE SHAFT HOUSING GASKET (ET1 2)	
121-141	THROTTLE SHAFT HOUSING GASKET (ET4)	
123-47S	IDLE ORIFICE TUBE AND PLUG ASSEMBLY	
136-55	SPRING WASHER (Between throttle lever and flange) (Sup by 136 124)	
136 82	MAIN VENT PLUG GASKET	
136-105	Throttle lever shaft washer	
136-124	Spring washer (Between throttle lever and flange) (Sup by 63 104)	
145 51S	MAIN VENT TUBE AND PLUG ASSEMBLY	
149-76S	Step up jet assembly (Sup by 149 99S)	
149 99S	STEP UP JET ASSEMBLY	
159 63S	†Main metering jet assembly (four sizes lean)	
159-87S	†Main metering jet assembly (three sizes lean)	
159-89S	†Main metering jet assembly (two sizes lean)	
159-93S	Main metering jet assembly (Sup by 159 94S)	
159 94S	MAIN METERING JET ASSEMBLY	
160-78S	STEP UP PISTON PLATE AND ROD ASSEMBLY	
163-37	Carter Seal	
163-49	★Adjusting nut seal	
170-107S	Throttle shaft housing assembly (ET1 2)	
170-143S	Throttle shaft housing assembly (ET4)	

★Governor parts are of the latest design and must be set to 220 6 specifications (Form 4718F) when used to rebuild 220 2 and 220 4 After rebuilding and calibration is complete stamp 220 6 on cover plate assembly

†Three to six thousand feet altitude use one size lean Six to nine thousand feet altitude use two sizes lean Nine to twelve thousand feet altitude use three sizes lean Twelve thousand feet and higher use four sizes lean

NOTE Figures in parentheses indicate number of pieces used in one carbureter Where no figure is shown, only one is used.

DODGE TRUCK 1946-1947

BB Down-Draft Carbureters With Governor—**EYC1-EYC3**

(E7C1 can be used in place of EYC1-EYC3)

ENGINE NO. SYMBOL T-136

VEHICLE MODEL WJ

Note: Truck Serial Nos. 81850001 and higher. Motor Nos. T-136, 1001 and higher

CARBURETER SPECIFICATIONS

Six Cylinder Engine: 3¾ Inch Bore, 4¼ Inch Stroke

Dimensions: Flange size, 1½ inch S. A. E
Throttle bore, 1-11/16 inch (42.86 mm).
Main venturi, 1-11/32 inch (3.413 mm).

Float Setting: Top of float 5/64 inch (1.98 mm) plus or minus 1/64 inch (.397 mm) below top surface of carbureter body casting.

Vents: Outside: none. Inside balance vent tube .218 inch (5.56 mm) inside diameter.

Gasoline Intake Needle: Triangular, horizontal needle seat hole No 44 (2.18 mm) drill.

Idle Orifice Tube: Jet size, .0276 inch (.70 mm).
Idle passage air bleed (in air horn), size 0688 inch (1.75 mm).
(EYC1) Idle restriction in body, size .059 inch (1.50 mm).
(EYC3) Size .0629 (1.60 mm).

Idle Ports: Upper port: slot type. Length, .128 inch (3.251 mm). Width, 027 inch (.686 mm).
Top of port .088 to .098 (2.235 mm to 2.489 mm) above top edge of valve (in slot).
Lower port size: .053 to .057 inch (1.35 to 1.45 mm) diameter (For idle adjustment screw).

Set Idle Adjustment: (EYC1) ⅝ to 1⅛ turns open, (EYC3) ¾ to 1¼ turns open. For richer mixture turn screw out. Do not idle engine below 450 to 500 r.p.m. motor speed.

Vacuum Spark Port: None

Main Metering Jet: Calibrated to flow 344 to 348 cc per minute Do not gauge for size If in doubt, replace with new part

Main Vent: Fuel chamber to vent tube well (in air horn), size 063 inch (1.60 mm) diameter. In vent tube plug, size 0433 (1.10 mm) diameter.

Main Vent Tube: Side holes. 1—.0354 (.90 mm) diameter 3/32 inch (2.381 mm) from end
1—0354 (.90 mm) diameter, ⅛ inch (3.175 mm) from end
1—0236 (.60 mm) diameter, ½ inch (12.70 mm) from end
1—0236 (.60 mm) diameter, 17/32 inch (13.49 mm) from end
1—.0157 (.40 mm) diameter, 1-15/32 inch (37.31 mm) from end.

Step-Up Jet: Size, 0492 (1.25 mm) diameter

Accelerating Pump: Type, vacuum operated Stroke, non-adjustable. Pump intake passage ball check seat size 115 to 120 inch (2.93 to 3.05 mm) diameter.
Pump discharge passage ball check seat size, 062 to 065 inch (1.58 to 1.65 mm) diameter.
Pump discharge jet, size .0315 inch (.80 mm) diameter

Choke: Offset butterfly type, with poppet valve.

FOR GOVERNOR INSTRUCTIONS, SEE FORM 4718F

MOTOR TUNE-UP

Spark Plug Gap	Set Breaker Points	Use Motor Gauge Breaker Points to Open	Set Valves (Hot)	Float Setting	Idle Adjustment Screw Setting
.025"	.020"	.005" (3° B.T.D.C.)	Intake .010" Exhaust .018"	5/64 Inch	(EYC1) ⅝ to 1⅛ Turns Open (EYC3) ¾ to 1¼ Turns Open

CARBURETER ADJUSTMENTS

Correct float adjustment is important and should be made in the following way

Place float gauge (No T109-50) across the carbureter body Press float lever down to hold float pin against the bottom of the slot in the body casting Floats should just clear the projections on the gauge. If adjustment is necessary, bend lip on float lever toward intake needle to lower level or away from the needle to raise the float level

If motor stalls while idling, set throttle lever adjusting screw so motor runs between 450 and 500 R P M. Then set idle adjustment screw (EYC1) ⅝ to 1⅛, (EYC3) ¾ to 1¼ turns open from closed position If a vacuum gauge is available, adjust to highest steady gauge reading

Accelerating pump is actuated by the intake manifold vacuum and no adjustment is necessary However, be sure the bowl cover gasket and flange gasket seal to prevent any air leaks to the pump vacuum passages.

If engine misses when load is suddenly increased, remove pump jet and clean with compressed air. However, it is usually advisable to replace the pump jet, as its cost is nominal. (All jets must be seated gasoline tight) This condition may also be due to damaged or worn plunger leather in accelerating pump cylinder or discharge check in discharge passage If plunger is removed from cylinder, use care when installing to avoid damage to plunger leather.

Correct air fuel ratio is provided by a 'balance tube" in the air horn The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner Should the cleaner become clogged, the capacity will be reduced but the air-fuel mixture ratio will not be changed

A fuel filter is incorporated in the carbureter bowl casting It should be cleaned periodically by removing the filter bowl and element (small discs) Soak element in acetone or a mixture of half and half Ethyl Alcohol and Benzol until all foreign material dissolves Then allow to dry CAUTION—do not blow off with compressed air which may damage discs

PARTS LIST

WHEN SERVICING, USE GASKET ASSORTMENT No 191; REPAIR PACKAGE No 1370A

PART NAMES IN CAPITAL LETTERS, LISTED BELOW, INDICATE CONTENTS OF REPAIR PACKAGE

Part No.	PART NAME	
1-500S	Body flange assembly (complete with 220 11 governor) (Sup by 1-578S)	
1-534S	Body flange assembly (complete with 220 15 governor) (Sup by 1 578S)	
1-578S	★Body flange assembly (complete with 220 19 governor)	
1A-31	FLANGE GASKET	
3-539S	Throttle lever shaft and arm assembly (EYB1)	
3-583S	Throttle lever shaft and arm assembly (EYB4)	
4-491S	Throttle lever assembly	
4A-96	Throttle shaft pickup dog	
6-545S	Air horn assembly	
7-105S	Choke valve assembly	
11B-17	PUMP DISCHARGE PASSAGE PLUG	
11B-41	Rivet plug	(4)
11B-69	Rivet plug	
11B-79	Rivet plug	
11B-108	Idle port rivet plug	
11B-138	PUMP JET RIVET PLUG	
11B-186S	Governor primary adjusting screw passage plug assembly	
11B-194	Bowl drain plug	
11B 201S	Governor secondary adjusting screw passage plug assembly	
11B-206S	Needle seat plug assembly	
11B-214S	Filter bowl assembly	
11B-220	HIGH SPEED PASSAGE PLUG	
14-357S	Choke shaft and lever assembly	
20-26	Main metering jet gasket	
20-35	Governor primary adj screw plug gasket	
20-36	Governor secondary adj screw plug gasket	
20 51	Step up jet gasket	
20-52	STEP UP PISTON GASKET	
20-70	Needle seat gasket	
20-90	FILTER BOWL GASKET	
20-91	NEEDLE SEAT PLUG GASKET	
21-98S	Float and lever assembly	
24-23	FLOAT LEVER PIN	
25-148S	NEEDLE AND SEAT ASSEMBLY	
30-44	Filter element (optional)	
30 52	Filter element (Sup by 30 55S)	
30-55S	Filter element	
30A-37	Idle adjustment screw	
38A-57S	★Adjusting nut assembly (Stamped No 27)	
39-10	Choke valve attaching screw	(2)
48-73	PUMP JET	
61-84	Idle adjustment screw spring	
61-135	STEP UP PISTON SPRING	
61-144	Pump spring (Cadmium plated)	
61-145	Pump spring (Copper plated) (Sup by 61 144)	
61-157	Plunger spring	
61-299	Choke spring	
61 302	★Friction spring	
61-308	★Primary spring (Cadmium plated 043" wire diameter 20 coils)	
61-322S	★Secondary spring assembly	
61-373	Pump spring (for altitude operation only) (Copper oxide plated)	
62-151S	Choke tube bracket assembly	
63-24	Float lever pin retainer	
63-37	Pump cylinder ball retainer	
63-85	★Secondary adjusting screw retainer	
63-104	Throttle shaft retaining ring	
64 93S	Pump plunger rod spring and piston assembly (Identify by copper plated spring) (Sup by 64 117S)	
64-117S	PUMP PLUNGER ROD SPRING AND PISTON ASSEMBLY (Identify by cadmium plated spring)	
64-118S	Pump plunger rod spring and piston assembly (for altitude operation only) (Identify by copper oxide plated spring)	
86-9	Throttle stop screw washer (EYB1)	
86-10	Choke bracket attaching screw lock washer	
86-15	Flange stud lock washer	(2)
86-16	Throttle valve screw lock washer (Sup by 86 54)	(2)
86-17	Throttle stop screw lock washer (EYB4)	
86-51	Throttle shaft dog lock washer	
86-54	Throttle valve screw lock washer	(2)
101-10	Wire clamp screw	
101-12	Choke bracket clamp screw	
101-38	Choke bracket attaching screw (long)	
101-121	Throttle adjusting screw	
101-142S	Choke tube bracket attaching screw and washer assembly	
101-145S	Body flange attaching screw and washer assembly	(2)
101-149S	Throttle shaft housing attaching screw and washer assembly (EYB4)	(3)
101-150S	Air horn attaching screw and washer assembly	(3)
101-160S	Cover to governor housing attaching screw	(6)
101-164	Throttle lever clamp screw	
101-199S	Air horn attaching screw and washer assembly (hex head)	(2)
101-215	★Secondary adjusting screw	
101-216S	Throttle shaft housing attaching screw and washer assembly (EYB1)	
101-217	Throttle stop screw (EYB1)	
101-220	★Primary adjusting screw (Stamped No 27)	
101-231	Throttle shaft dog attaching screw	
101-232	Throttle valve attaching screw	(2)
101-234S	Body flange attaching screw and washer assembly (lower)	
101-257	Throttle stop screw (EYB4)	
103-11	Lead shot	(2)
105A-10	Choke tube clamp nut	
105A-13	Flange nut	
105A-28	Throttle lever clamp nut	
116-13	PUMP INTAKE CHECK BALL	
116-18	PUMP DISCHARGE CHECK BALL	
118 59S	Governor cover housing assembly	
121-105	BOWL COVER GASKET	
121-114	BODY FLANGE GASKET	
121-123	Governor housing cover gasket	
121-125	THROTTLE SHAFT HOUSING GASKET (EYB1)	
121-141	THROTTLE SHAFT HOUSING GASKET (EYB4)	
123-47S	IDLE ORIFICE TUBE AND PLUG ASSEMBLY (EYB4)	
123-48S	Idle orifice tube and plug assembly (EYB1)	
136-55	SPRING WASHER (Between throttle lever and flange) (Sup by 136 124)	
136-82	MAIN VENT PLUG GASKET	
136-105	Throttle lever shaft washer	
136-124	Spring washer (Between throttle lever and flange) (Sup by 63 104)	
145-51S	MAIN VENT TUBE AND PLUG ASSEMBLY	
149-99S	STEP UP JET ASSEMBLY	
159-63S	†Main metering jet assembly (four sizes lean)	
159 87S	†Main metering jet assembly (three sizes lean)	
159-89S	†Main metering jet assembly (two sizes lean)	
159-93S	†Main metering jet assembly (one size lean)	
159-94S	MAIN METERING JET ASSEMBLY	
160-78S	STEP UP PISTON PLATE AND ROD ASSEMBLY	
163-37	Carter Seal	
163-49	★Adjusting nut seal	
170-107S	Throttle shaft housing assembly (EYB1)	
170-143S	Throttle shaft housing assembly (EYB4)	

★Governor parts are of the latest design and must be set to 220 19 specifications (Form 4718F) when used to rebuild 220 11 and 220 15 After rebuilding and calibration is complete stamp 220 19 on cover plate assembly

†Three to six thousand feet altitude use one size lean Six to nine thousand feet altitude use two sizes lean Nine to twelve thousand feet altitude use three sizes lean Twelve thousand feet and higher use four sizes lean

NOTE Figures in parentheses indicate number of pieces used in one carbureter Where no figure is shown, only one is used

CARTER CARBURETOR
DIVISION OF acf INDUSTRIES INCORPORATED
ST. LOUIS, MO., U. S. A.

March, 1947
Revised August, 1950

THE CARTER VELOCITY GOVERNOR

Us d in conjunction with carburet rs EYB1-EYB4-EYC1-EYC3-ET1-ET2-ET4-E7B1-E7C1-E7F1-E7S1

Truck models: Dodge 2½ ton, 3 ton, 4 wheel drive Power Wagon

GOVERNOR ASSEMBLY

1. Cover Plate Lead Seal Plugs
2. Secondary Adjusting Screw Plug
3. Speed Adjusting Screw Plug
4. Lead Car Seals
5. Idle Mixture Adjusting Screw
6. Governor Unit Number
7. Throttle Shaft Housing Assembly
8. Throttle Stop Screw
9. Idle Speed Adjusting Screw

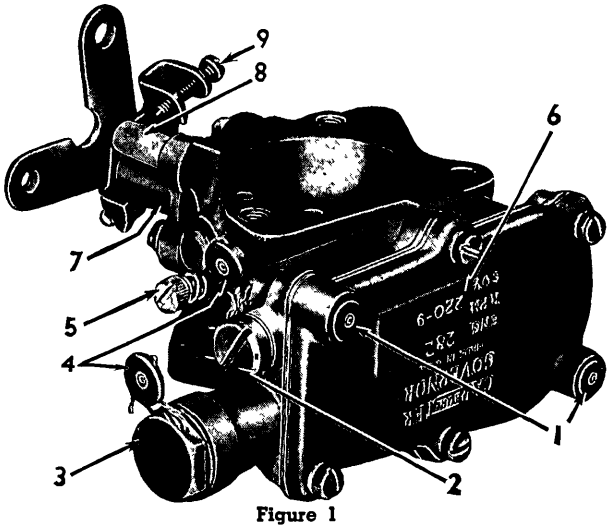

Figure 1

The action of the throttle valve is the same as that in conventional carbureters up to the governed spe d of the engine. The governor therefore, does not affect idle or economy nor does it affect power or acceleration under the speed at which engine is governed.

GOVERNOR ADJUSTMENTS

The governor is properly calibrated when it leaves the factory and should not require any attention, aside from a possible change in the maximum engine speed to satisfy the operator's requirement.

Before any governor adjustment is attempted engine must be tuned to manufacturer's specifications.

Run engine until normal operating temperature is reached. The manifold vacuum at sea level must be at least 16 inches with engine operating at no load, vehicle standing, transmission in neutral (wide open throttle with governor controlling engine speed) and at least 17 inches at idling speed (450-500 R.P.M.) with an allowable reduction of approximately 3½ inches at 5,000 feet above sea level.

To adjust maximum governed engine speed, remove large screw cap and gasket and with an off-set or short screw driver, turn the primary adjusting screw (Figure 2) clockwise to decrease engine speed, and counter-clockwise to increase engine speed.
CAUTION: Do not turn adjusting screw out beyond the end of the governor housing to the extent that it will interfere with the complete tightening of the screw cap. Primary spring can become disengaged from the adjusting screw if screw is turned too far out (do not force).

The maximum governed, no load, engine speed should not exceed 3000 revolutions per minute on the 3 ton trucks, or more than 3200 revolutions per minute on the 2½ ton truck and Power Wagon.

It is desirable to check and set the maximum governed engine speed with the aid of a reliable electric or mechanical tachom t r. If a tachometer is not available, the governor setting can be determined approximately by operating the vehicle at full throttle on a smooth level road surface, no load, in transmission third gear on the 2½ and 3 ton trucks, and transmission second gear on the Power Wagon.

Check the rear axle gear ratio and tire size and refer to the "Speed Chart" (Chart 1 on the 2½ and 3 ton trucks, Chart 2 on the Power Wagon), for the maximum governed miles per hour (M.P.H.) in transmission (third gear on 2½ and 3 ton trucks, second gear on Power Wagon), and adjust the governor if necessary.

'B" Specification—Number of active spring coils from end of adjusting screw thread to end of spring

"C" Dimension—Measurement from housing boss to end of adjusting screw

GOVERNOR SERVICE INSTRUCTIONS

If governor has been tampered with, or should the adjusting screw be turned out of the primary spring due to faulty adjustment, recalibration will be necessary to insure proper operation This will require removal of the carbureter from the engine
If recalibration is necessary, proceed as follows

1 Determine the governor unit number (stamped on the cover plate and also on housing on later production) and refer to the chart in conjunction with Figure 2 for calibration specifications

2 Remove lead seal plugs from the two depressed screw openings in the governor cover plate by prying out with a small screw driver Remove all retaining screws and cover **Never attempt to remove governing lever assembly from nd f throttle valve shaft.**

3 Remove shaft housing and lever assembly located at end of throttle shaft opposite governor assembly. Before removal be sure to note and mark position of long throttle stop screw for correct reassembly. Never immerse this part in cleaning solvent as this may cause swelling of throttle lever shaft assembly seal

4 Carbon or gum deposits in the throttle shaft bearing races may eventually cause friction and result in sluggish and inac curate governor performance Therefore, it is advisable, before proceeding with recalibration of governor, to squirt some non-corrosive solvent in the narrow space between the throttle shaft and shaft openings in the throttle bore and clean with compressed air Do not use any solvent which might leave a gummy film Never apply lubricating oil to the throttle shaft bearings.

5 Check fit of throttle valve in throttle bore as follows

Hold governor valve open and with long nose pliers disconnect loop of primary spring from the governing lever link. This will allow the throttle valve to close with very little pressure from the secondary spring and makes checking of the throttle valve fit much easier. The throttle valve must not touch the bore of the carbureter flange when in any position except when completely closed. Check the centering of the valve by holding the flange up to a light, closing the valve tightly and looking through the bore. The valve should touch the bore at the idle port and also the point opposite to it The sides of the valve near the throttle shaft **should not touch the bore** and approximately the same clearance should be visible on both sides. If throttle valve is not properly aligned, loosen the two attaching screws, then with the valve in closed position rotate and shift valve with the fingers to obtain proper alignment. Tighten the two screws Connect primary spring to governing lever link **Do not tap throttle valve or throttle shaft when refitting valve.**

6 Remove secondary adjusting screw plug and gasket assembly and check "A" dimension of secondary adjusting screw and spring assembly. Open throttle to make sure that the secondary spring is not in contact with governing lever. Turn secondary screw clockwise to decrease dimension, and counter clockwise to increase dimension
Secondary spring assembly may be removed for replacement by removing retainer while pressing lightly on head of secondary adjusting screw, then backing out screw

Upon reassembly, be sure that retainer is installed in proper slot and not against thread (see Figure 2), and that sec ondary spring compresses without buckling as throttle valve is closed If spring buckles, remove secondary spring assembly and revolve entire spring assembly 1/6 turn and reinstall If necessary, repeat until buckling condition no longer exists **Never remove secondary spring from its holder since this will damage spring.**

7. Check "C" dimension (throttle valve closed) This controls the primary spring tension (First make sure that the adjust ing nut is pressed all the way into casting by tapping with tool T109-185)
Correct 'C" dimension if necessary by turning the **primary adjusting screw,** clockwise to increase dimension counter clockwise to decrease dimension

8 Check "B ' specification This is the number of active coils In order that the number of active coils may easily be counted, hold the throttle valve closed to separate the coils In counting the number of active coils start at the first complete coil from the loop end as shown in Figure 3 The active coils end at the entering edge of the primary adjust ment screw thread as shown in Figure 4

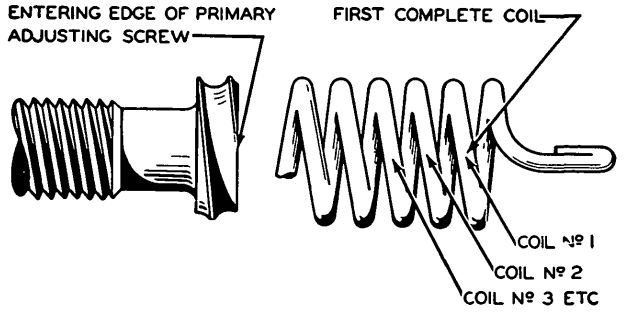

FIGURE 4 FIGURE 3

If the number of active coils **is within** one coil of B' speci fication, insert and drive fiber adjusting nut seal into governor housing (Figure 2) against adjusting nut (A short piece of 1/4 inch pipe may be used for that purpose) If fiber seal is already in place, do not insert another
If the number of active coils **is not within on coil** of "B' specification, indications are that the spring has been tampered with and recalibration with the adjusting nut is necessary

9 Before proceeding with the nut adjustment, check to see if the governor has the fiber adjusting nut seal If it has remove as follows·
Hold throttle valve open, unhook the primary spring from the link, and using a narrow screw driver, turn the primary adjusting screw clockwise until it is out of adjusting nut Place fiber drift inside governor housing against adjusting nut and drive out nut and seal The same method should be followed for removing primary adjusting screws and adjusting nuts for replacement if damaged whether or not governor has a fiber seal

To reassemble primary adjusting screw and adjusting nut assembly, proceed as follows:

Install primary adjusting nut, driving nut against seat in housing with tool No. T109-185 (always use new part to mak certain of tight fit). Start primary adjusting screw in adjusting nut from inside of housing, then turn screw counter clockwise with narrow screw driver until all but a few threads have engaged the nut. Screw will be a tight fit as it will be cutting new threads in adjusting nut fiber insert

Insert tail of primary spring in slot in governor housing, bring against entering edge of adjusting screw and turn screw clockwise until a few coils have been engaged Hook spring to governing lever link

10. If no fiber washer was found or after the fiber washer has been removed, proceed to set the amount of active coils ("B" specification) with the adjusting screw.

    Where a fractional number of coils is required, first adjust to the nearest whole number of coils as described above. Then add or subtract the fractional coil by turning the primary adjusting screw the same fraction of a turn. As an example— if 14-3/4 coils are called for in "B" specification, adjust to obtain exactly 15 active coils. Then turn primary adjusting scr w 1/4 turn or 90° clockwise, thereby reducing the number of active coils to 14-3/4.

    Should the end coil of the primary spring contact the governor housing, or if the primary adjusting screw is turned in so far that the slotted end becomes flush with the adjusting nut assembly before the correct amount of coils is obtained, it will be necessary to adjust the nut. Hold the primary adjusting screw with screw driver so that it cannot turn, while turning th adjusting nut with tool No. T109-185

11. Onc th correct number of active coils has been established with the adjusting screw, set "C" dimension.
    To do this, hold the primary adjusting screw with screw driver **so that it cannot turn,** while turning the adjusting nut with tool T109 185. Turn clockwise to decrease "C" dimension, counter clockwise to increase the dimension When dimension is correct, tap end of wrench with a light hammer to seat adjusting nut, as adjusting nut must be firmly seated, **then r check dimension.** Insert fiber adjusting nut seal as previously explained

12 Inspect throttle shaft pick up dog for wear. If replacing dog, install in proper relation to throttle valve as shown in Figure 5. If dog is tight, do not hammer or tap in place. Draw into place with screw and lock washer.

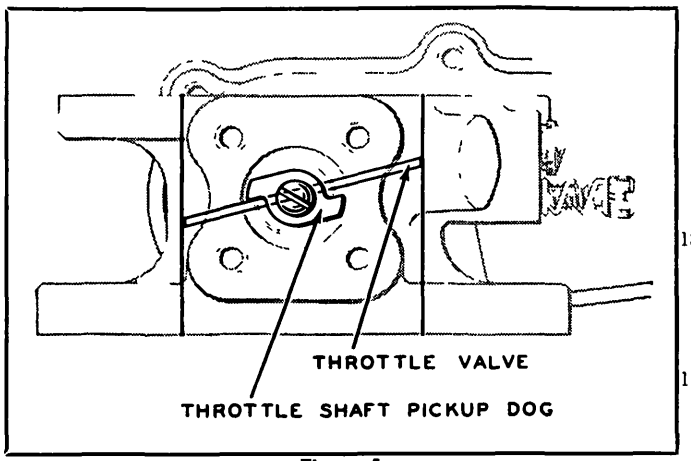

Figure 5

Caution—Excessive tightening may shear screw.

Before installing same or new shaft housing and lever assembly be sure that throttle lever assembly is snug against the shoulder of the flat on the shaft (stub).

Holding throttle valve closed, and throttle lever assembly in open position, install shaft housing and lever assembly and gasket with throttle stop screw in previously marked position.

13. Install governor housing cover and gasket

    While supporting governor housing over edge of bench, place lead shot (Part 103-11) in the two depressed screw openings. Tamp into place and stamp with identifying tool Install adjusting screw plug assemblies.

14. Install carbureter and governor assembly on engine Warm up engine. Hook up tachometer and check maximum governed no load speed. Set with primary adjusting screw to required R P M. or in conformance with speed chart if tachometer is not available.

Should engine surge (continued rapid rise and fall of engine speed) at maximum governed engine speed (no load, transmission in n utral), turn **secondary** adjusting screw counter-clockwise ½ turn at a time until surge is just eliminated. If this adjustment increases the maximum governed engine speed, reduce same by turning the **primary** adjusting screw clockwise until maximum governed engine speed is re-established

15. When final adjustments are completed, install adjusting screw plug assemblies Seal by threading wire through plug and hole in boss in governor housing and crimp lead seal with identifying tool **Both adjustments must be sealed with wir and lead seal.**

RECONDITIONING BEYOND THAT COVERED BY THESE INSTRUCTIONS IS NOT RECOMMENDED AND MAY REQUIRE REPLACEMENT OF THE COMPLETE GOVERNOR AND FLANGE ASSEMBLY.

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service, check float level Wear on lip of float lever will raise float level Before adjusting float, be sure lever pin plug is firmly seated Reset float level by bending lip of float lever away from needle to raise level, or bending lip towards needle to lower float level Bend vertical lip of float only.

If motor stalls while idling, set throttle lever adjusting screw so motor runs approximately 300 rpm. Then set idle adjustment screw as instructed above If these adjustments do not correct the trouble, remove idle orifice tube and plug assembly and clean with compressed air.

If acceleration is not satisfactory, remove pump jet and clean with compressed air Also examine pump link setting Pump link has three holes giving short, medium and long strokes If link is set to short stroke, reset to give longer stroke to pump piston. In hot weather high altitudes, or when high test gasoline is used, connect pump link in inner hole, giving shorter stroke

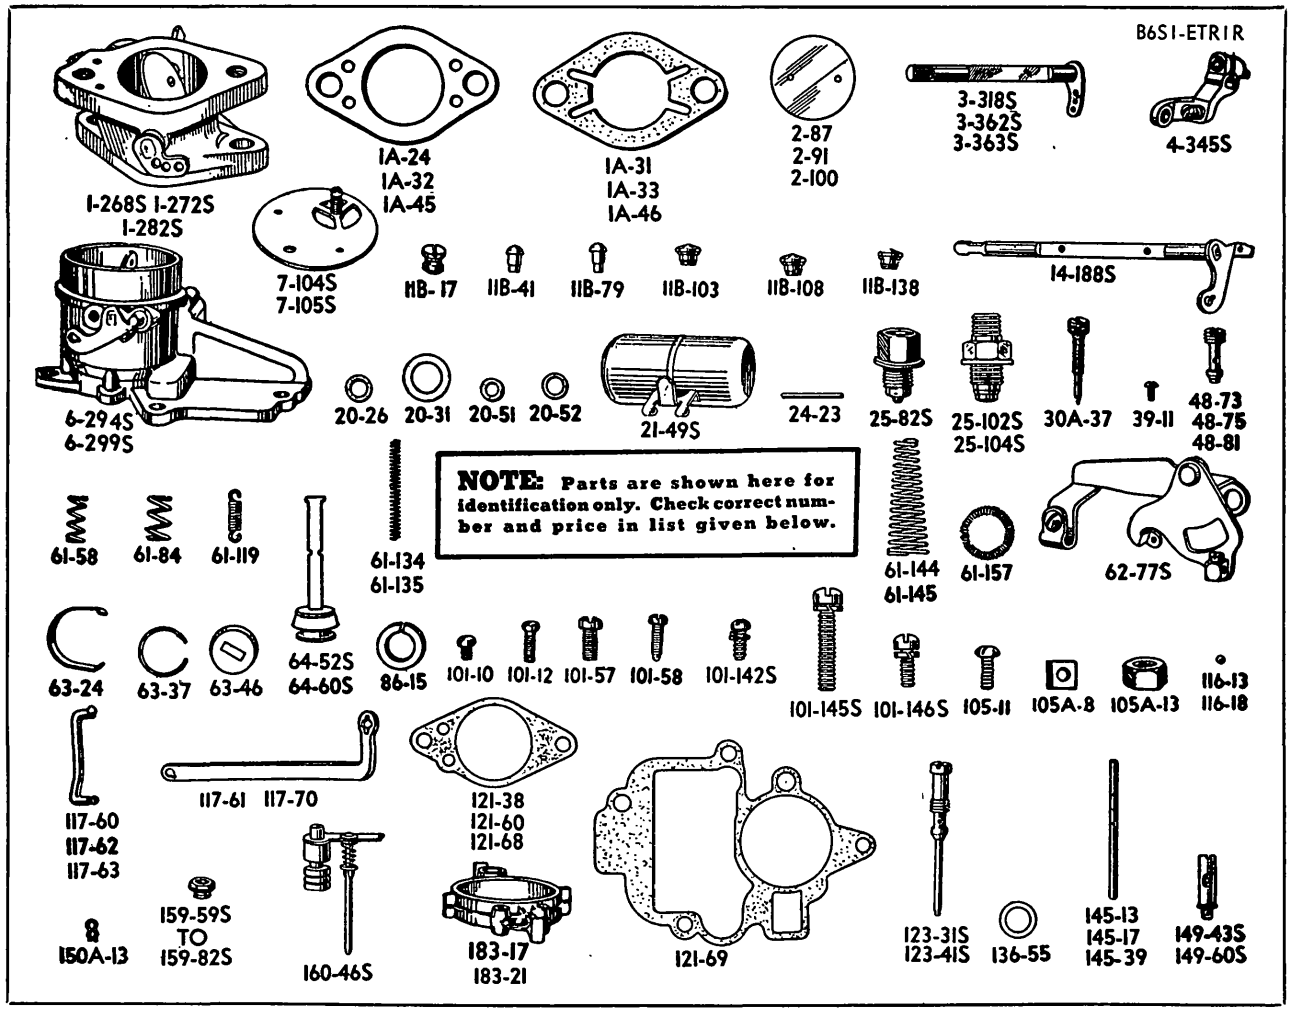
Pump Adjustment: Remove air horn assembly, back out throttle adjustment screw, and place pump operating link in center of throttle shaft arm Adjustment can be made by bending horizontal portion of pump lifter link, so that top of pump plunger shaft contacts lip of indicator on pump stroke gauge T109-117S Correct travel is 24/64" on DTA2-DTB1-DTB1R-DTB2-DTB2R-DTB3-DTB3R, 19/64" on B6S1, and 26/64" on ETP2-ETR1-ETR1R

Maximum economy is secured only when breaker points, spark plugs, valves and motor timing are set to manufacturer's specifications After motor is properly tuned, the following should also be done to insure satisfactory performance and economy

(a) Float level must be set as above

(b) Step-up rod in step-up jet must seat and move freely. When reassembling, jet must be screwed in tight against seat

(c) Step-up piston in body casting should not bind and must be free of dirt



(d) Main metering jet can be replaced with leaner than standard metering jets, for altitude

Caution Do not attempt to gauge metering jets with drills These jets have been flow-tested to insure correct fuel flow.

DODGE MODEL "D-24" 1946

B-B DOWN-DRAFT CARBURETER—**MODEL D6J1**

CARBURETER SPECIFICATIONS

For Dodge Six Cylinder Engine: 3¼ Inch Bore, 4⅝ Inch Stroke

Dimensions: Flange size, 1½ inch S. A. E.
Throttle bore, 1-9/16 inch (39.69 mm).
Main venturi, 1¼ inch (31.75 mm) I. D.

Float Setting: Top of float 5/64 inch (1.98 mm) plus or minus 1/64 inch (.397 mm) below top of surface of carbureter body casting.

Vents: Outside, none. Inside balance vent .218 inch (5.54 mm) diameter.

Gasoline Intake Needle: Triangular, horizontal. No. 44 (.086 inch) (2.18 mm) drill in needle seat.

Idle Orifice Tube: Jet size, .0295 inch (.75 mm). Idle passage air bleed (in body), size .067 inch (1.70 mm). Idle restriction in body, size .054 to .055 inch (1.37 to 1.39 mm) diameter.

Idle Ports: Upper port, keyhole type; length .160 inch (4.06 mm); width, .030 inch (.76 mm); .045 inch (1.14 mm) diameter hole at top.
Top of port located .118 to .122 inch (3.00 to 3.10 mm) (early production) and .128 to .132 inch (3.25 to 3.35 mm) (late production), above top edge of valve.
Lower port: (For Idle Adjustment Screw) Size, .053 to .057 inch (1.35 to 1.45 mm) diameter.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture, turn screw out. Do not idle engine below 300 r.p.m. or 6 miles per hour.

Main Metering Jet: Calibrated to flow 254 to 258 cc per minute. (Do not gauge for size. If in doubt, replace with new part.)

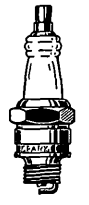
Main Vent: Through diffuser (air bleed inside bowl) size .0315 inch (.80 mm) drill.

Main Vent Tube: Side holes, 6—.0354 inch diameter.

Step-Up Jet: No. 63 (.94 mm) drill size.

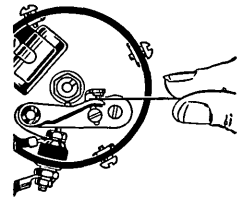
Accelerating Pump: Type, delayed action, seasonal adjustment. Summer setting (inner hole, short stroke). Intermediate setting (center hole). Winter setting (outer hole, long stroke). Pump intake passage, ball check seat, size .115 to .120 inch (2.93 to 3.05 mm) diameter.
Pump discharge passage; restriction (under ball check), size .062 to .065 inch (1.58 to 1.65 mm) diameter in body.
Pump (discharge) jet, size .0276 inch (.70 mm) drill.

Pump Adjustment: 24/64" (9.52 mm) plunger travel (center hole). Use gauge No. T109-117S.



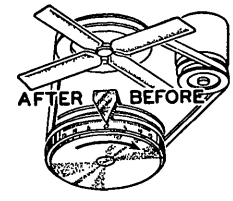
Choke: Butterfly type, with poppet valve. Inter-connected to open throttle valve to fast idle position when choke is used.

Slow Closing Throttle: Dash pot with discharge (by-pass), size .0197 (.5 mm) drill, through plunger shaft.

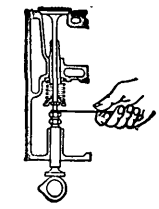


Vacuum Spark Port: Slot (round end) type. Size .040 by .110 inch (1.016 to 2.794 mm). Bottom of port .003 to .009 inch (.076 to .229 mm) or .019 to .025 inch (.482 to .635 mm) (early production); .021 to .027 inch (.533 to .686 mm) (late production), above top edge of valve.

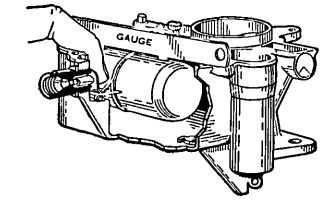
Motor Tune-Up—Be Accurate! Always Use Feeler Gauges!



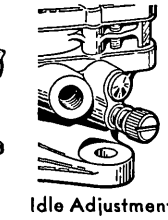
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter



Spark Plug Gap .030"



Breaker Point Setting .020"



Ignition Timing Breaker Points to Open: Top Dead Center

Valve Setting (Hot) Intake .007"-.009" Exhaust .007"-.009"

Float Setting (Use Gauge) 5/64 Inch

Idle Adjustment Screw Setting ½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service, check float level. Wear on lip of float lever will raise float level. Before adjusting float, be sure float lever pin is firmly seated. Reset float level by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level. Bend vertical lip of float only.

If motor stalls while idling, set throttle lever adjusting screw so motor runs approximately 300 RPM, then set idle adjustment screw to specifications. If these adjustments do not correct the trouble, remove idle orifice tube and plug assembly. Clean tube and passages with compressed air.

If acceleration is not satisfactory, remove pump jet and clean with compressed air. However, it is usually advisable to replace the pump jet, as its cost is nominal. All jets must be seated gasoline tight. Poor acceleration may be due to damaged or worn plunger leather in accelerating pump, sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage. If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather.

Correct air fuel ratio is provided by a "balance tube" in the air horn. The balance tube should be checked each time the carbureter is serviced to see that the passage is open. The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner. Should the cleaner become clogged, the capacity will be reduced but the air-fuel mixture ratio will not be materially altered.

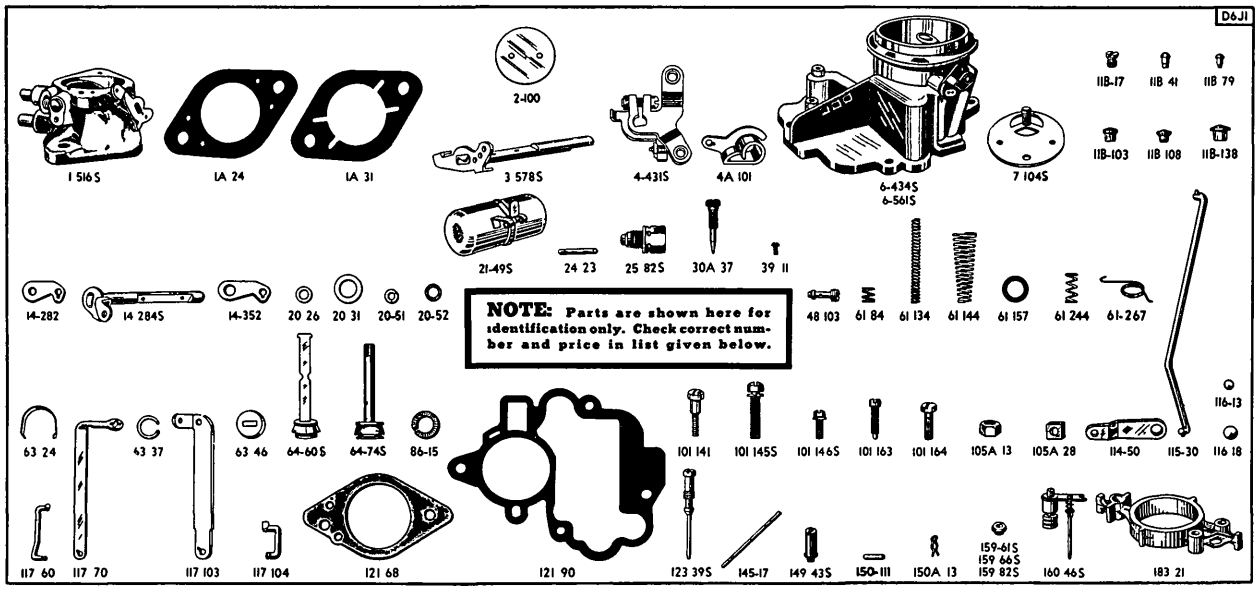
CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with tool No T109-43, main vent tube can be removed and a new tube inserted with tool No. T109-195. Care must be exercised in inserting new tube which must seat tightly. Use new rivet to complete the installation.



Pump Adjustment: Remove air horn assembly, back out throttle adjusting screw and locate pump link in center hole of the throttle shaft arm Place base of pump travel gauge T109-117S on top edge of body casting at pump cylinder so that lip of pump travel gauge extends over top of plunger shaft. With throttle valve seated, turn knurled nut of gauge until finger rests on top of plunger shaft Take indicated reading and repeat with the throttle wide open and pump plunger pressed to bottom of cylinder. Difference in readings obtained should be "24" (24/64" plunger travel) Adjustment can be made by bending horizontal portion of pump lifter link

Dash-Pot Adjustment: Engines operating in connection with fluid couplings frequently tend to stall during rapid deceleration unless the throttle closes slowly Slow throttle movement is necessary only the last part of the closing The dash-pot or decelerating pump acts as a snubber to the throttle, allowing fast movement to almost closed position, then slow closing from that point to the idle position.

When the throttle is released, the throttle valve closes rapidly until throttle shaft arm contacts the dash-pot pick-up arm. Then the dash-pot plunger must be pushed to the bottom of the cylinder before the throttle can close. A ball check located in the lower end of the plunger shaft seals the larger upper opening and the gasoline must leave the cylinder through the small metered hole in lower part of the shaft

This reduces the rate at which plunger can be forced to the bottom of the cylinder making the last part of the throttle closing very slow **The adjusting screw** (in top of bowl cover) **should be opened five full turns from closed position** for average conditions Under extreme driving conditions greater openings may be necessary, although extreme dash-pot action will affect gear changes, and not enough action will allow engine to stall

Be sure plunger leather is soft and pliable and effects a good seal against the cylinder wall

BB DOWN-DRAFT **CARBURETER 588S**

CARBURETER SPECIFICATIONS

For Hercules JXE-3—6 Cylinder Engine—3½ inch Bore, 4¼ inch Stroke
For Hercules JXB—6 Cylinder Engine—3-5/8 inch Bore, 4¼ inch Stroke
For Hercules JXD—6 Cylinder Engine—4 inch Bore, 4¼ inch Stroke

Dimensions: Flange size, 1½ inch S. A. E.
Throttle bore, 1-11/16 inch.
Main venturi, 1-11/32 inch.

Float Setting: Top of float 5/64 inch, plus or minus 1/64 inch below top surface of carbureter body casting.

Vents: Outside: none. Inside, balance vent. .218 inch diameter.

Gasoline Intake Needle: Triangular, horizontal No. 38 drill in needle seat.

Idle Orifice Tube: Jet size, .0276 inch (early production); .031 inch (late production).
Idle passage air bleed (in body) size .063 inch.
Restriction (in body) size .052-.054 inch (early production); .054-.056 inch (late production).

Idle Ports: Upper port, keyhole type; length .128 inch. Width .027 inch, .063 inch diameter hole at top. Top of port located .088 to .092 inch above top edge of valve.
Lower port size, .053 to .057 inch diameter. (For idle adjustment screw.)

Set Idle Adjustment Screw: 1 to 1¾ turns open. For richer mixture, turn screw out. Do not idle engine below 375 r.p.m.

Vacuum Spark Port: None.

Main Metering Jet: Calibrated to flow 312 to 316 cc per minute. Do not gauge for size. If in doubt, replace with new part.

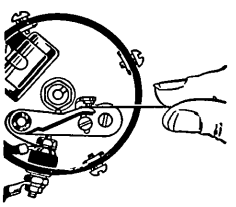
Main Vents: Through diffuser (air bleed inside bowl) size, .0315 inch.

Accelerating Jets: 2—.0354 drill approximately 5/16 inch from end.
2—.0354 drill approximately 1 inch from end.

Step-up Jet: .0413 inch (1.05 mm) drill.

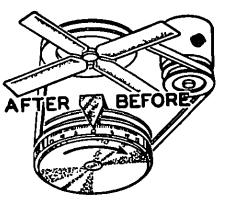
Accelerating Pump: Type, delayed action. Stroke, summer setting (inner hole, short stroke). Intermediate setting (center hole). Winter setting (outer hole, long stroke). Pump intake passage ball check seat, size .115 to .120 inch diameter. Pump discharge passage: Restriction (under ball check) size .062 to .065 inch diameter in body. Pump (discharge) jet, size .0374 inch (.95 mm) drill.

Pump Setting: 26/64 inch plunger travel (full throttle position) medium hole.

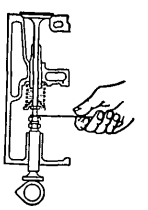


Choke: Butterfly type, with poppet valve.

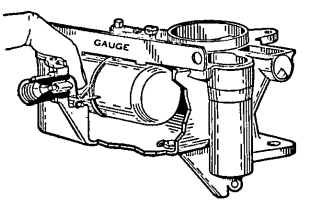
Motor Tune-Up—Be Accurate!



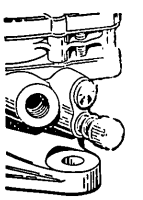
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .025"



Breaker Point Setting .020"



Ignition Timing Breaker Points to Open: 5° B. T. D. C.

Valve Setting (Hot) Intake .008" Exhaust .010"

Float Setting 5/64 Inch (Use Gauge T109-50)

Idle Adjustment Screw Setting 1 to 1¾ Turns Open

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service, check float level. Wear on lip of float lever will raise float level. Before adjusting float, be sure float lever pin is firmly seated. Reset float level by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level. Bend vertical lip of float only.

If motor stalls while idling, set throttle lever adjusting screw so motor runs approximately 300 r. p. m. Then set idle adjustment screw to specifications. If these adjustments do not correct the trouble, remove idle orifice tube and plug assembly. Clean tube and passages with compressed air.

If acceleration is not satisfactory, remove pump jet and clean with compressed air. However, it is usually advisable to replace the pump jet, as its cost is nominal. All jets must be seated gasoline tight. Poor acceleration may be due to damaged or worn plunger leather in accelerating pump, sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage. If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather.

Correct air fuel ratio is provided by a "balance tube" in the air horn. The balance tube should be checked each time the carbureter is serviced to see that the passage is open. The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner. Should the cleaner become clogged, the capacity will be reduced but the air-fuel mixture ratio will not be changed.

CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

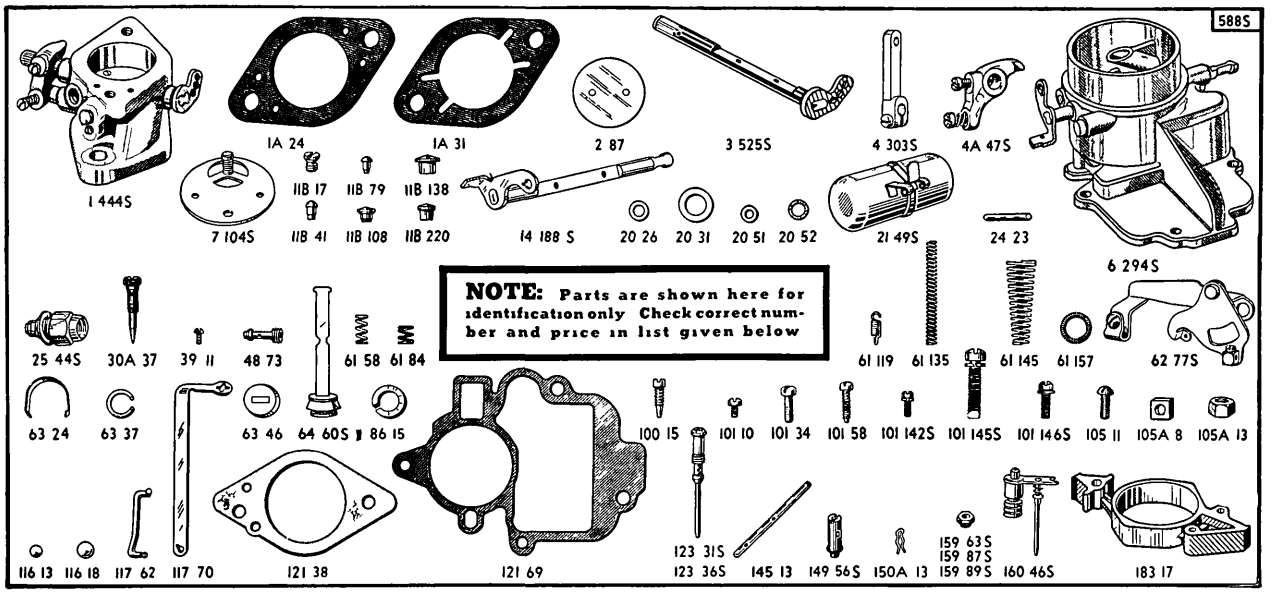
PRINTED IN U.S.A.

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with tool No T109-43, main vent tube can be removed and a new tube inserted with tool No T109-195 Care must be exercised in inserting new tube which must seat tightly Use new rivet to complete the installation

Pump adjustment. Remove air horn assembly, back out throttle adjustment screw, and place pump operating link in center hole of throttle shaft arm Adjustment can be made by bending horizontal portion of pump connector link, so that top of pump plunger shaft contacts lip of indicator on pump stroke gauge T109-117S Correct travel is 26/64"

Pump stroke adjustable for high or low temperature Set to longest stroke for cold weather, shorter stroke for hot weather driving

Maximum economy and performance are secured only when breaker points, spark plugs, valves and motor timing are set to manufacturer s specifications After motor is properly tuned, the following should also be done to insure satisfactory performance and economy



(a) Float level must be set as above

(b) Step-up rod in step-up jet must seat and move freely When reassembling jet must be screwed in tight against seat

(c) Step-up piston in body casting should not bind and must be free of dirt

(d) Main metering jet can be replaced with leaner than standard metering jets for altitude

Caution. Do not attempt to gauge metering jets with drills These jets have been flow-tested to insure correct fuel flow

FEDERAL TRUCK – 1950

MODEL 1500T

BBR1 DOWN-DRAFT CARBURETER—**No. 841S**

CARBURETER SPECIFICATIONS

For Hercules QXLD Six Cylinder Engine 3 7/16 Inch Bore 4¼ Inch Stroke

Dimensions Flange size 1¼ inch S A E
Throttle bore 1 7/16 inch (36 51 mm)
Main ventur 1¼ inch (31 75 mm)

Float Setting Top of float 5/64 inch (1 98 mm) below top surface of carbureter body casting Plus or minus 1/64 inch (397 mm)

Bowl Vent Outside size 3/16 inch (4 76 mm) diameter

Gasoline Intake Needle Triangular horizontal No 44 (2 18 mm) drill in needle seat

Idle Orifice Tube Jet size 0276 inch (70 mm) Idle passage air bleed (in body) size 067 inch (1 70 mm) diameter Restriction in body size 051 to 052 inch (1 30 to 1 32 mm) diameter

Idle Ports Upper port keyhole type length 160 inch (4 06 mm) width 030 inch (76 mm) 045 inch (1 14 mm) diameter hole at top Top of port located 118 to 122 inch (3 00 to 3 10 mm) above top of valve Lower port size 053 to 057 inch (1 35 to 1 45 mm) diameter (For idle adjustment screw)

Set Idle Adjustment Screw ½ to 1½ turns open For richer mixture turn screw out Do not idle engine below 350 r p m

Main Metering Jet Calibrated to flow 248 to 252 cc per minute (Do not gauge for size If in doubt replace with new part)

Main Vent Through diffuser (air bleed inside bowl) size 0315 inch (80 mm) drill

Main Vent Tube Side holes
1—No 76 (020 inch) (508 mm) diameter 11/16 inch (17 46 mm) from end
1—No 73 (024 inch) (610 mm) diameter 1 3/16 inch (30 16 mm) from end
1—No 70 (028 inch) (712 mm) diameter 1 5/16 inch (33 34 mm) from end
1—No 70 (028 inch) (712 mm) diameter 1 27/64 inch (38 10 mm) from end
1—No 70 (028 inch) (712 mm) diameter 1½ inch (38 10 mm) from end
1—No 68 (031 inch) (812 mm) diameter 1 39/64 inch (40 88 mm) from end
1—No 68 (031 inch) (812 mm) diameter 1 11/16 inch (42 86 mm) from end

Step Up Jet 0394 inch (1 00 mm) drill size

Accelerating Pump Type delayed action Stroke summer setting (inner hole short stroke) Intermediate setting (center hole) Winter setting (outer hole long stroke) Pump intake passage ball check seat size 115 to 120 inch (2 92 to 3 05 mm) diameter Pump discharge passage restriction (under ball check) size 062 to 065 inch (1 58 to 1 65 mm) diameter in body Pump (discharge) jet size 0236 inch (60 mm)

Pump Adjustment 38/64 inch plunger travel with pump link in medium stroke hole

Choke Butterfly type with poppet valve

Vacuum Spark Port Horizontal round end type size 040 by 110 (1 016 by 2 794 mm) Top of port 035 to 041 inch (89 to 1 04 mm) above top edge of valve

MOTOR TUNE-UP

Spark Plug Gap	Breaker Point Setting	Ignition Timing Breaker Points to Open	Valve Setting (Hot)	Float Setting 5/64 Inch	Idle Adjustment Screw Setting
025"	018"	T D C	Intake 008" Exhaust 010"	±1/64 Inch	½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service check float level Wear on lip of float lever will raise float level Before adjusting float be sure float lever pin is firmly seated Reset float level by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level Bend vertical lip of float only

If motor stalls while idling, set throttle lever adjusting screw so motor runs approximately 350 r p m Then set idle adjustment screw to specifications If these adjustments do not correct the trouble remove idle orifice tube and plug assembly Clean tube and passages with compressed air

If acceleration is not satisfactory, remove pump jet and clean with compressed air However it is usually advisable to replace the pump jet, as its cost is nominal All jets must be seated gasoline tight Poor acceleration may be due to damaged or worn plunger leather in accelerating pump sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage If plunger is removed from cylinder use care in installing to avoid damage to plunger leather

CARBURETER
TRADE MARK REG U S PAT OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.

Correct air fuel ratio is provided by a balance tube in the air horn The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of types size or condition of air cleaner Should the cleaner become clogged the capacity will be reduced but the air-fuel mixture ratio will not be changed

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with tool No T109-43 main vent tube can be removed and a new tube inserted with tool No T109-195 Care must be exercised in inserting new tube which must seat tightly Use new rivet to complete the installation

Pump Adjustment Remove air horn assembly, back out throttle adjustment screw, and place pump operating link in center hole of throttle shaft arm Adjustment can be made by bending horizontal portion of pump connector link, so that top of pump plunger shaft contacts lip of indicator on pump stroke gauge T109-117S Correct travel is 38/64

Pump stroke adjustable for high or low temperature Set to longest stroke for cold weather, shorter stroke for hot weather driving

Maximum economy and performance are secured only when breaker points spark plugs, valves and motor timing are set to manufacturer s specifications After motor is properly tuned, the following should also be done to insure satisfactory performance and economy

(a) Float level must be set as above

(b) Step-up rod in step-up jet must seat and move freely When reassembling jet must be screwed in tight against seat

(c) Step-up piston in body casting should not bind and must be free of dirt

(d) Main metering jet can be replaced with leaner than standard metering jets for altitude

CAUTION Do not attempt to gauge metering jets with drills These jets have been flow-tested to insure correct fuel flow

---

PARTS LIST

WHEN SERVICING, USE GASKET ASSORTMENT No 121

Part No	PART NAME	
1-234S	Body flange assembly	
1A 23	Flange gasket—for use with governor	
1A-30	Flange gasket—for use without governor	
2-86	Throttle valve	
3-338S	Throttle shaft and arm assembly	
4-590S	Throttle lever assembly	
4A-47S	Fast idle cam assembly (Sup by 4A 55S)	
4A-55S	Throttle shaft dog assembly

UT UPDRAFT **CARBURETER No. 2612S**

CARBURETER SPECIFICATIONS

For Ferguson 4 Cylinder 134 Cu. In. Engine: Vacuum at Idle Approximately 22 Inches

Dimensions: Flange size 1 inch S A E
Throttle bore 1-1/16 inch
Main venturi, 13/16 inch

Vents: Outside none Inside (2)

Gasoline Intake Needle: Size No 50 (.070 inch) drill in needle seat

Idle Jet: Jet, plug in flange body, size No 65 (.035 inch) drill
Lower bleed size No 60 (.040 inch) drill (Cannot gauge)
Upper bleed size No 65 (.035 inch) drill
Economizer No 60 (.040 inch) drill

Idle Port Lower port slot type length .050 inch, width .030 inch

Idle Port Opening: Bottom of port .044 to .048 inch below lower edge of valve

Upper Port (For Idle Adjustment Screw): Size No 60 (.040 inch) drill

Set Idle Adjustment Screw: 1/4 to 1 1/4 turns open For richer mixture, turn screw out Do not idle engine below 450 r p m

High Speed Adjustment Screw: 3/4 to 1 1/2 turns open

Nozzle: Inside diameter No 32 (.116 inch) drill
Accelerating Jets 1 No 62 (.038 inch), 1 No 70 (.028 inch) drill

Air Bleed to Nozzle: (Thru plug) size No 72 (.025 inch) drill

Choke: Manual—Butterfly type with pressure relief (poppet) valve

Vacuum Spark Port: None

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap	Breaker Point Setting	Ignition Timing Breaker Points to Open:	Valve Setting (Hot)	Float Setting	Idle Adjustment Screw Setting

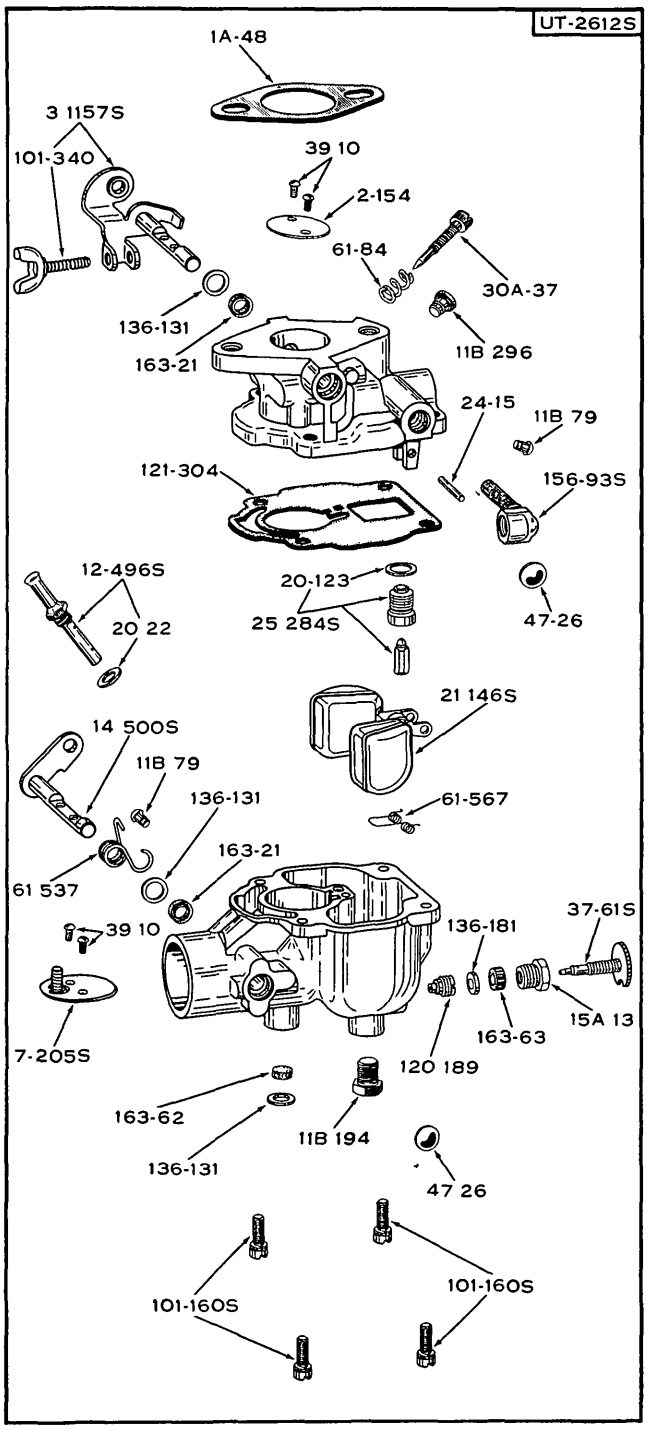
CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: With throttle body inverted and gasket removed there should be 11/64 inch clearance (plus or minus 1/64 inch) between machined surface of throttle body and seam of float (both sides) To adjust bend lip on float lever

IDLE ADJUSTMENT Set throttle lever adjusting screw until motor runs approximately 450 r p m Then set idle adjustment screw for highest steady vacuum gauge reading or smoothest engine operation Correct setting will be found between 1/4 to 1 1/4 turns open

HIGH SPEED ADJUSTMENT: With hand throttle wide open and engine operating 2000 r p m (governed speed) adjust high speed adjusting needle until smoothest engine operation is obtained This setting will be found between 3/4 to 1 1/2 turns open.



MAXIMUM PERFORMANCE: Can be secured only when breaker points spark plugs, valves and motor timing are set to manufacturer s specifications

If carbureter does not respond to the above adjustments disassemble clean all parts in carbureter cleaner rinse and blow out all passages with compressed air Replace all worn or damaged parts Always use new gaskets See Form No 3525 for complete overhaul procedure

"TO-35" Tractor
and
"A-HO-60" Stationary
Power Plant

FERGUSON TRACTOR

UT UPDRAFT CARBURETERS Nos. 997S-2223S-2402S-2709S

CARBURETER SPECIFICATIONS

For Ferguson 4 Cylinder Engine: 3¼ Inch Bore, 3⅞ Inch Stroke (997S-2709S)
For Ferguson 4 Cylinder Engine: 3-5/16 Inch Bore, 3⅞ Inch Stroke (2223S-2402S)

Dimensions: Flange size, 1 inch S. A. E.
Throttle bore, (997S-2709S) 1-1/16 inch, (2223S-2402S) 1-3/16 inch.
Main venturi, (997S-2709S) 23/32 inch, (2223S-2402S) 13/16 inch.

Float Setting: See Adjustments.

Vents: Outside, none. Inside, balance vent, one 7/32 inch and one No. 8 (.199 inch) drill.

Gasoline Intake Needle: Size No. 50 (.070 inch) drill in needle seat.

Idle Jet: Jet tube (997S-2709S) plug (2223S-2402S) size, No. 66 (.033 inch) drill.
Lower bleed: (997S-2709S) size No. 60 (.040 inch) drill, (2223S-2402S) No. 55 (.052 inch) drill
Upper bleed: (997S-2709S) size No. 65 (.035 inch) drill (2223S-2402S) none.
Economizer. (997S-2709S) No. 61 (.039 inch) drill. (2223S-2402S) No. 59 (.041 inch) drill.

Idle Port: Lower port, slot type, length (997S-2709S) .049 to .051 inch, (2223S-2402S) .079 to .081 inch; width .029 to .031 inch.

Idle Port Opening: Bottom of port (997S-2709S) 044 to 048 inch (2223S-2402S) .060 to .064 inch below lower edge of valve.

Upper Port (For Idle Adjustment Screw): Size .038 to .042 inch diameter.

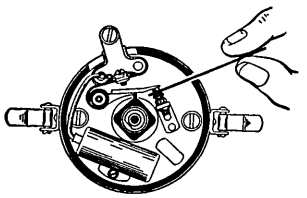
Set Idle Adjustment Screw: ¼ to 1½ turns open. For richer mixture, turn screw out. Do not idle engine below 400 r.p.m.

Main Metering Jet: Adjustable. See adjustments.

Nozzle: Inside diameter (997S-2709S) No 42 (.0935 inch) (2223S-2402S) No. 37 (.104 inch) drill
Accelerating Jets: (997S-2709S 4 (2223S-2402S) 2 No. 64 (.036 inch) drill.

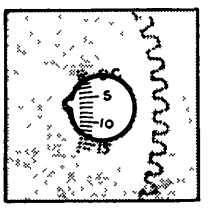
Air Bleed to Nozzle: (Thru plug) size (997S-2709S) No. 53 (.0595 inch (2223S-2402S) No. 57 (.043 inch) drill.

Choke: Manual—Butterfly type, with pressure relief (poppet) valve.



Vacuum Spark Port: None.

Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

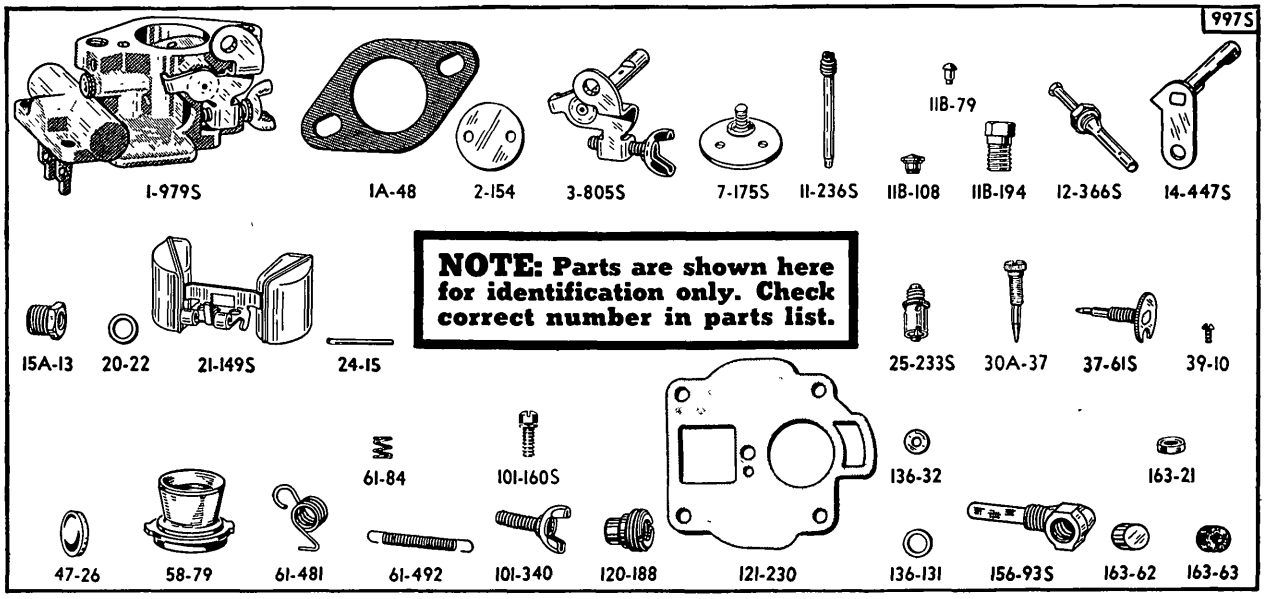
CARBURETER ADJUSTMENTS



FLOAT ADJUSTMENT: With throttle body inverted and gasket removed, there should be (997S-2709S) 17/64, (2223S-2402S) 11/64 inch clearance (plus or minus 1/64 inch) between machined surface of throttle body and seam of float (both sides). To adjust, bend lip on float lever.

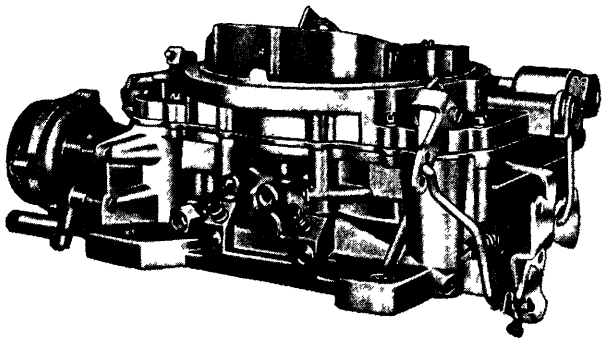
IDLE ADJUSTMENT: Set throttle lever adjusting screw until motor runs approximately 400 r.p.m. Then set idle adjustment screw for highest steady vacuum gauge reading or smoothest engine operation. Correct setting will be found between ¼ to 1½ turns open.

HIGH SPEED ADJUSTMENT: With hand throttle wide open and engine operating 2000 r.p.m. (governed speed), adjust high speed adjusting needle until smoothest engine operation is obtained. This setting will be found between ¾ to 1½ turns open.

MAXIMUM PERFORMANCE: Can be secured only when breaker points, spark plugs, valves and motor timing are set to manufacturer's specifications.

If carbureter does not respond to the above adjustments, disassemble, clean all parts in carbureter cleaner, rinse and blow out all passages with compressed air. Replace all worn or damaged parts. Always use new gaskets. See form No. 3525 for complete overhaul procedure.

Ferguson Tractor — Carbureters Nos. 997S-2223S-2402S-2709S



WHEN SERVICING, USE GASKET ASSORTMENT No. 239 (997S), GASKET ASSORTMENT No. 259 (2223S); REPAIR PACKAGE No. 1782A (2223S)

FORD
THUNDERBIRD
1959

AFB Four-Bore Down-Draft Climatic® Control **Carbureter No. 2853S**

CARBURETER SPECIFICATIONS

For Ford 8 Cylinder 430 Cu. In. Engine: Vacuum at Idle 17-18 Inches

Dimensions: Flange four-bore—4 bolt type
Throttle bore primary 1-9/16 inch, secondary, 1 11/16 inch I D
Primary venturi size primary side, 7/16 inch secondary, 11/32 inch I D
Main venturi size, primary side, 1-3/16 inch, secondary side 1-9/16 inch I D

Vents: Inside (2) in air horn: Outside (2) in air horn

Low Speed Circuit: (Primary side only)
Jet, size No 67 (.032 inch) drill
By-pass, size .057 inch diameter
Economizer, size No 56 (.0465 inch) drill
Idle bleed, size No 54 (.055 inch) drill
Idle port slot type length .220 inch, width .030 inch

Idle Port Opening: .152 to .158 inch above top edge of valve with valve tightly closed.

Lower Port: (For idle adjustment screw), size .0635 inch diameter

Set Idle Adjustment Screw: 1½ to 2½ turns open For richer mixture turn screw out Idle engine at 450 R P M for Auto Trans in Drive Range

Main Nozzle: Installed permanently DO NOT REMOVE Anti-percolator bleed primary, (tube in venturi assembly) size No 70 (.028 inch) drill Secondary (drilled hole in venturi assembly) size No 57 (.043 inch) drill
Under strut bleed primary side only size No 42 (.0935 inch) drill

Main Vent Tube: (In venturi assembly) Side holes primary I—size No 40 (.060 inch) drill secondary no side holes

Secondary Initial Discharge: (In venturi assembly, secondary side only)
Pick up tube, size No 56 (.0465 inch) drill
Air bleed size No 60 (.040 inch) drill
Discharge port (upper) size No 53 (.0595 inch) (lower) size, No 60 (.040 inch) drill

Accelerating Pump: Discharge jet (twin) primary side only size No 70 (.028 inch) drill Intake disc check (screw plug) size 115 to 120 inch diameter Disc check bleed size .016" to .020" Discharge needle seat, size .070 inch diameter

Choke: Carter Climatic® Control set on index Butterfly type—offset choke valve primary side only Choke heat suction hole restriction in body size No 45 (.082 inch) drill

Vacuum Spark Port: Horizontal slot (round end) .055 x .130 inch Top of port .015 to .025 inch above top edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap	Breaker Point Setting	Ignition Timing	Float Setting	Idle Adjustment Screw Setting
.032"-.036"	.014"-.016"	Breaker Points to Open: 6° B.T.D.C. At Vibration Damper	3/16 Inch (Use Gauge T109-28)	1½ to 2½ Auto. Trans. 450 R.P.M. in Drive Range

NOTE: These cars are equipped with Hydraulic Valve Lifters—No Adjustment.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3780

FLOAT ALIGNMENT: Side of floats, parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding. To adjust, bend float lever.

FLOAT LEVEL: 3/16 inch (Gauge T109-28) plus or minus 1/64 inch between top of floats at outer end and air horn gasket. To adjust, bend float lever.

FLOAT DROP: 23/32 inch plus or minus 1/16 inch between top of floats at outer end and air horn gasket. To adjust, bend stop tabs on float brackets.

PUMP: 17/32 inch from the top of the bowl cover to the top of the plunger shaft with throttle connector rod in inner hole (long stroke) of pump arm.

CHOKE PISTON LEVER ADJUSTMENT: 3/32 inch (Gauge T109-125) between choke lever and stop in piston housing with choke held closed. To adjust, take slack out of linkage by setting counter shaft lever.

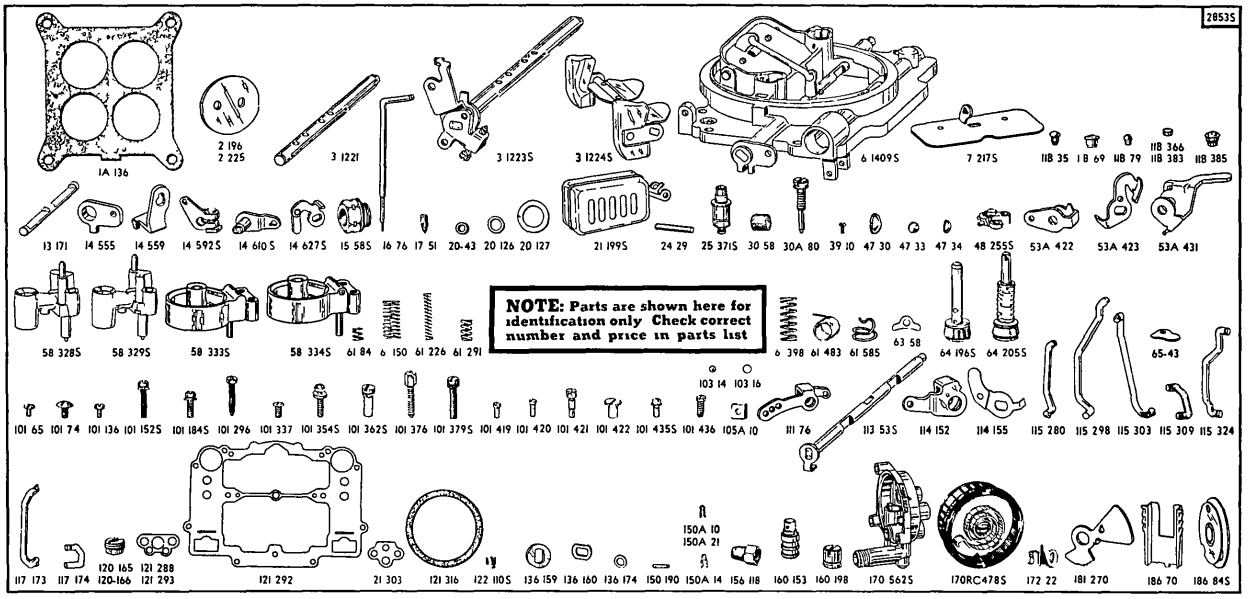
FAST IDLE LINKAGE ADJUSTMENT: With slight clearance between lug on fast idle cam and stop on flange casting, and inner countershaft lever contacting lug on outer conutershaft lever align index mark on cam with adjusting screw. To adjust, bend fast idle connector rod. It may be necessary to bend stop lug on fast idle cam.

FAST IDLE THROTTLE VALVE CLEARANCE: .030 inch (Gauge T109-29) between lower edge of valve and bore with adjusting screw on index mark of cam.

FAST IDLE ON CAR: 550 R.P.M. hot engine—with fast idle screw on lowest (last) step of cam.

UNLOADER: 1/8 inch (Gauge T109-36) between upper edge of choke valve and inner wall of air horn. To adjust, bend unloader arm on throttle lever.

SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Block choke valve wide open. 2. with 15/32 inch between lower edge of primary valve and bore (opposite idle port) secondary valves should just start to open. To adjust, bend throttle operating rod. NOTE: At wide open throttle primary and secondary valves will reach vertical position. 3. With primary and secondary throttle valves in tightly closed position there should be .010″ to .030″ (Gauge T109-29) between positive closing secondary shoe and cam on primary throttle lever. To adjust, bend shoe on secondary lever.



DASH POT: 1. 1/8 inch from the top of the bowl cover to the top of the plunger shaft with primary valves tightly closed. To adjust, bend the flat portion of the dash pot lever. Check to be sure dash pot lever does not contact bowl cover attaching screw. 2. 7/16 inch from the top of the bowl cover to the top of the plunger shaft with primary valves wide open. To adjust, bend stop lug on flat lever. Check to be sure plunger shaft operates without sticking in hole in bowl cover.

TOOLS REQUIRED FOR SERVICING CARBURETERS

T109-28	3/16″ Float gauge	T109-22	Bending Tool
T109-29	.020″ Wire gauge	T109-213	Bending Tool
T109-36	1/8″ Unloader gauge	T109-214	Bending Tool

T109-125 3/32″ Unloader gauge (Used for choke piston lever adj.)

CARTER MODEL AFB CARBURETOR FOR FORD
(SERVICE ADJUSTMENT PROCEDURE)

NOTE: The parts and specification pages referred to are catalog pages. These pages can be obtained from Carter-Carburetor, Catalog Department, St. Louis (7), Missouri. Specify the carbureter number found on the base of carbureter, when requesting specification pages.

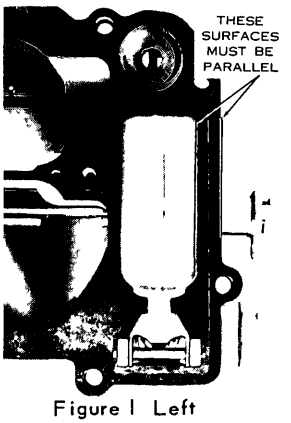

Figure 1 Left

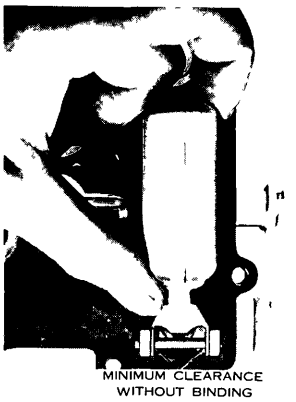

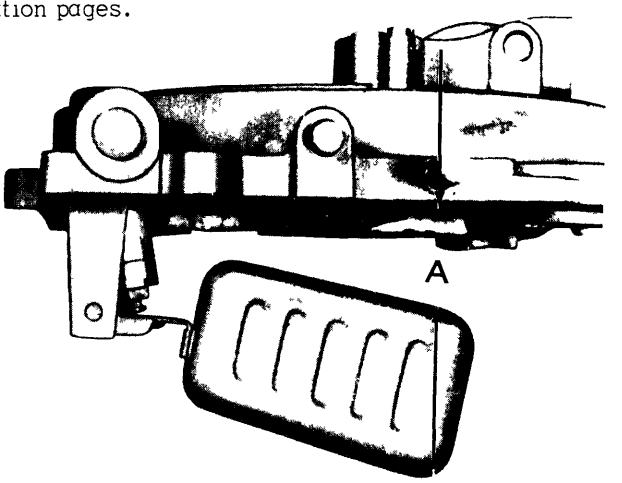

Figure 1 Right

FLOAT ALIGNMENT ADJUSTMENT (Fig. 1):

1. Sight down the side of the float shell to determine if the side of the float is parallel to the outer edge of the air horn casting. TO ADJUST: Bend float lever by applying pressure to the end of the float shell with the fingers while supporting the float lever with the thumb.

CAUTION: To avoid damaging the float, apply only enough pressure to bend float lever.

2. After aligning float, remove as much clearance as possible between arms of float lever and lugs on air horn by bending the float lever. Arms of float lever should be as parallel to the inner surfaces of lugs on air horn as possible.

   Floats must operate freely without excess clearance on its hinge pin.

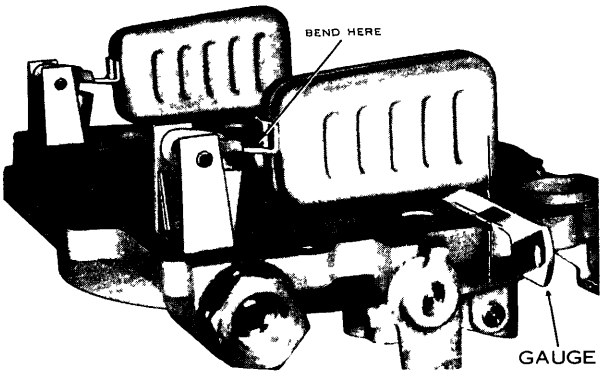

Figure 2

FLOAT LEVEL ADJUSTMENT (Fig. 2):

With air horn inverted, bowl cover gasket in place and needle seated, there should be the clearance as listed on carburetor sp cification page betwe n outer nd of float and air horn gasket. To adjust, bend float arm. Adjust both floats. Rech ck float alignment.

FLOAT DROP ADJUSTMENT (Fig. 3):

With bowl cover held in upright positi n and measuring from outer end of float, the distance (A) betwe n top of floats and bowl cover gasket should b as list d on specification page. To adjust, bend stop tabs on float brackets.

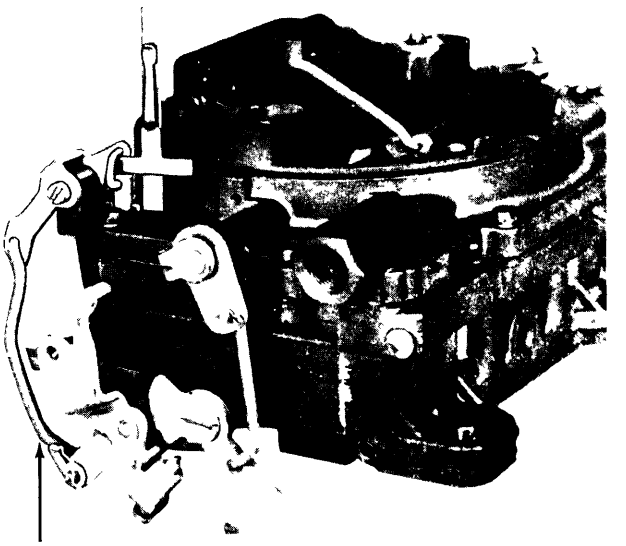

Figure 4

PUMP ADJUSTMENT (Fig. 4):

1. Back out idle speed screw until throttle valv s s at in bores of carburetor. NOTE: Be sure chok is wide open so fast idle cam does not hold throttle valve open.
2. With throttle connector rod in inner hole (long strok) of pump arm, the distance from the top of the bowl cover to the top of the plunger shaft should b as specified on carburetor sp cificati n page.
3. Adjust by bending throttle connector rod at lower angl (use to l T109-213).

MARCA REGISTRADA

PRINTED IN U.S.A.

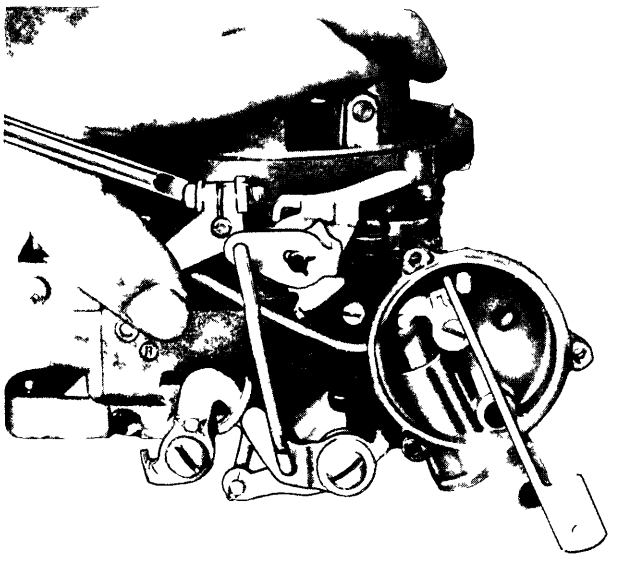

Figure 5

CHOKE PISTON LEVER ADJUSTMENT (Fig. 5):

Loosen countershaft lever clamp screw. Take end play out of countershaft, and hold choke valve tightly closed. Take slack out of linkage by pressing countershaft lever towards closed position with gauge in place between choke lever and stop in piston housing. Hold in place and tighten clamp screw.

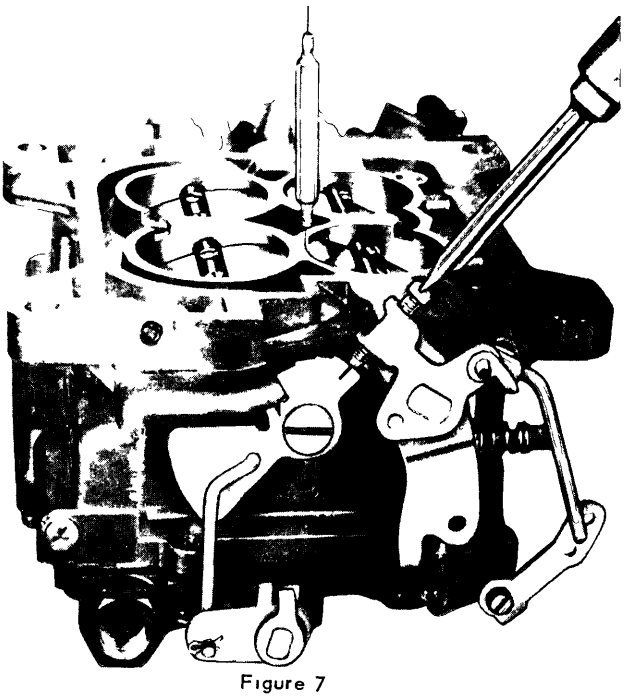

Figure 7

FAST IDLE THROTTLE VALVE CLEARANCE ADJUSTMENT (Fig. 7):

With choke valve tightly closed, tighten fast idle adjusting screw (on index mark of cam) until the clearance between throttle valve and bore of carbureter, side opposite idle port, is as listed on carbureter specification page.

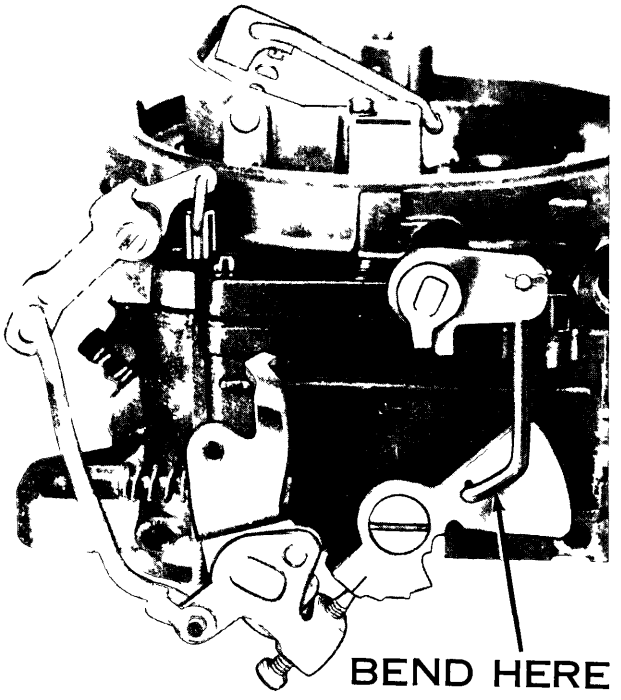

Figure 6

FAST IDLE LINKAGE ADJUSTMENT (Fig. 6):

With choke valve tightly closed and lug on outer choke shaft lever contacting stop on inner choke shaft lever align center of fast idle screw with index mark on cam. To adjust, bend fast idle connector rod. (Use tool T109-213).

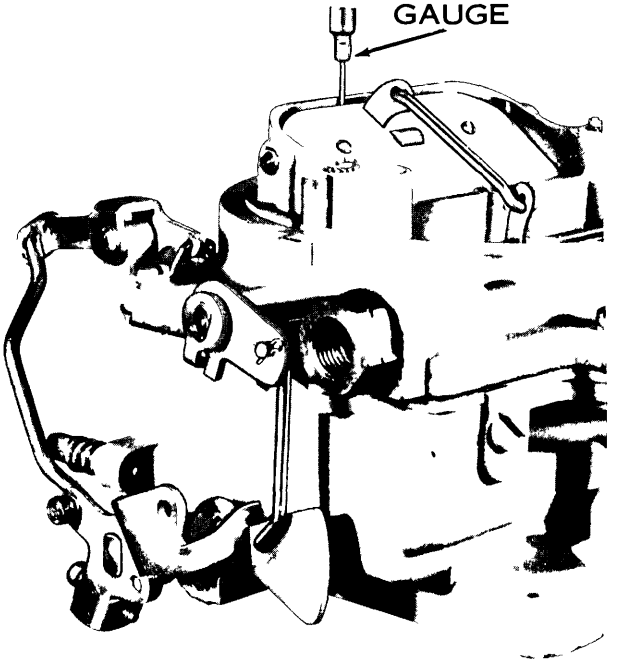

Figure 8

UNLOADER ADJUSTMENT (Fig. 8):

With throttle wide open there should be the clearance as listed on carbureter specification page between upper edge of choke valve and inner wall of air horn. To adjust, bend unloader lip on throttle shaft lever. (Use tool T109-214).

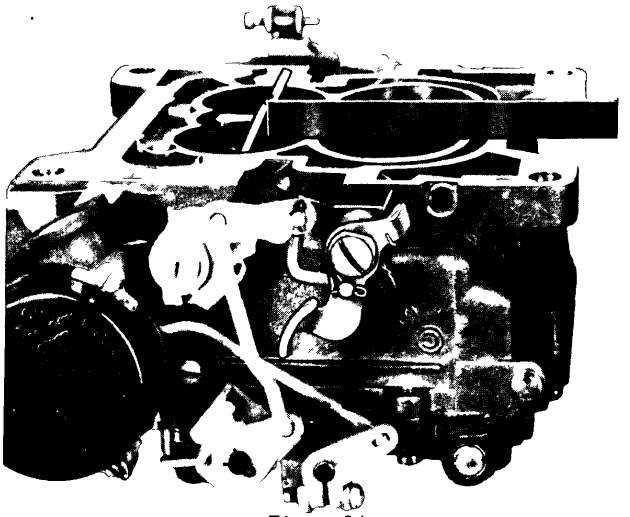

Figure 9A

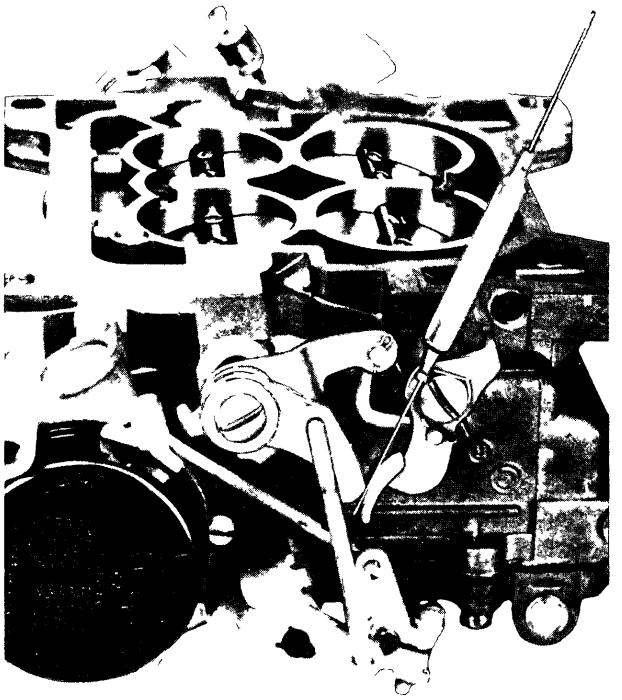

Figure 9B

SECONDARY THROTTLE LEVER ADJUSTMENT (Figs. 9A and 9B):

1. Block choke valve wide open.
2. Secondary throttle valves should just start to open when primary throttle valves are opened to the clearance as listed on specification page between lower edge of valve and bore (opposite idle port). To adjust, bend throttle operating rod. (Use bending tool T109-213). (See Fig. 9A) NOTE: Primary and secondary throttl valv s should reach wide pen p sition, full vertical, at the same time.
3. With primary and secondary throttl valves in tightly closed position, th r should b the cl arance as list d on specification page between positiv closing shoes on primary and s condary throttle levers. To adjust, bend shoe on secondary lev r. (S Fig. 9B).

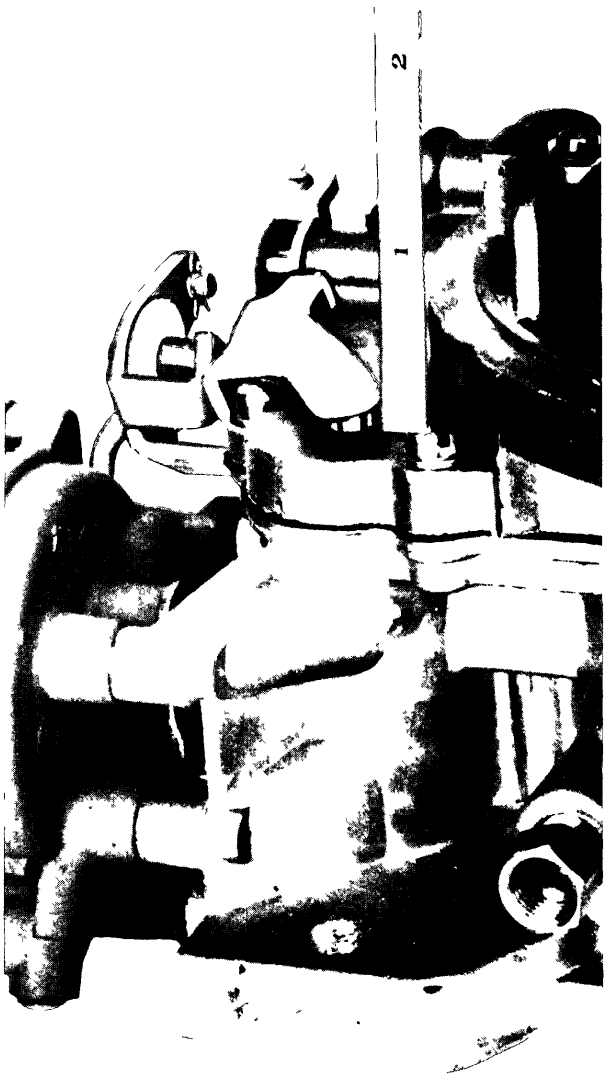

Figure 10

DASH POT ADJUSTMENT (Fig. 10):

1. With primary valves tightly closed there should be the distance as listed on specification page between the top surface of the bowl cover and the top of the plunger shaft. To adjust, bend the flat portion of the dash pot lever. Check to be sure dash pot l ver does not contact bowl cover attaching screw.
2. With primary valves wide open there should b the distance as listed on specification page between the top surface of the bowl cover and the top of the plunger shaft. To adjust, bend stop lug on dash pot lever. (Use bending tool T109-22). Check to be sure plunger shaft operates without sticking in hol in bowl cover.

NOTE: S e last page for pertinent service information.

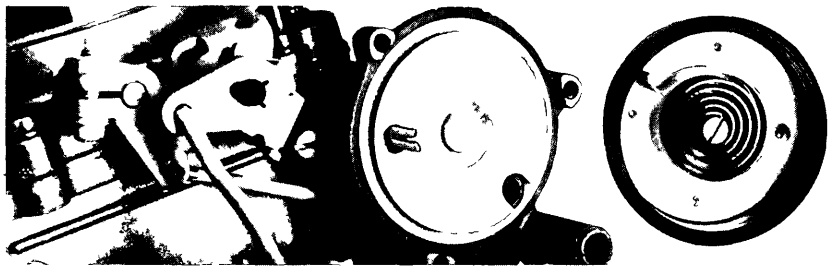

Figure 11

FIGURE 11:

After choke baffl plate assembly has been properly installed as shown in Fig. 11 install gasket and coil housing with the lip on the coil spring installed in the slot of the piston lever.

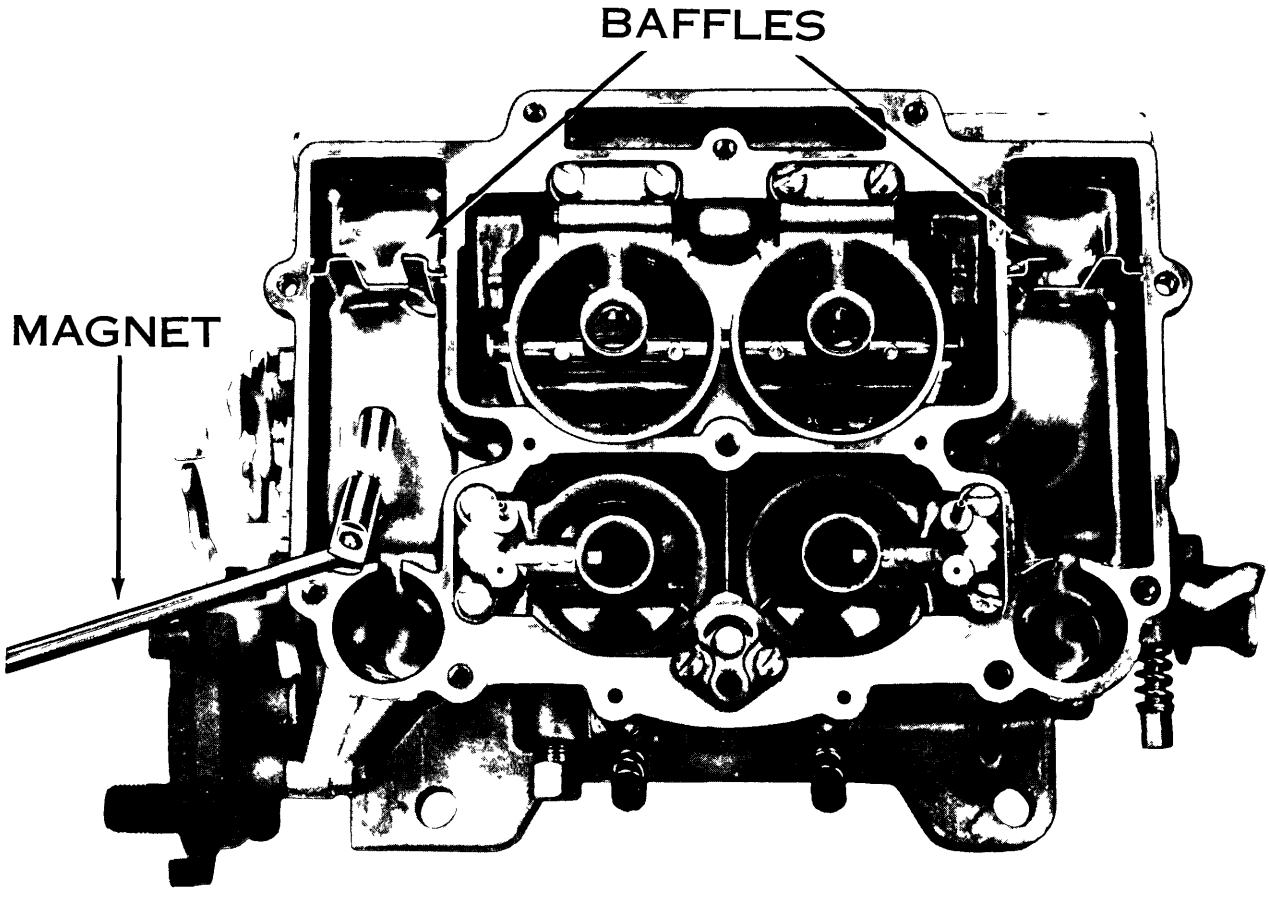

Figure 12

FIGURE 12:

Flooding, stumble on acceleration and other performance complaints are, in many instances, caused by the presence of dirt, water or other foreign matter in the carbureter. To aid in diagnosing the cause of the complaint, the carbureter should be carefully removed from the engine without draining the fuel from the bowl. The contents of the fuel bowl may then be examined for contamination as the carbureter is disassembled.

Ch ck the fuel in the bowl for contamination by dirt, water, gum or other foreign matter. A magnet moved through the fuel in the bowl will pick up and identify any iron oxide dust that may have caused intake needle and seat leakage.

Inspect gasketed surfaces between body and air horn. Small nicks or burrs should be smoothed down to eliminate air or fuel leakage. B especially particular when inspecting the top surface of the inner wall of the bowl around the vacuum piston passage. A poor seal at this location may contribute to a "cutting-out" on turns complaint.

Install fuel baffles as shown (Fig. 12) to prevent damage of floats.

Fill the carbureter bowl with clean fuel before installing on the manifold. This will help prev nt dirt trapp d in th fuel syst m from being dislodged by th free flow of fuel as the carburet r is primed. The operation of the floats and intake needle and seats may be checked under pressure if a fuel pump is used at th b nch to fill the carbureter bowl. Operate the throttle several times and visually check the discharg from th pump j ts.

Befor installing the carbureter, hold chok valve op n and turn the idle sp d scr w until it just contacts the throttle lever, then ½ a turn mor to op n the throttle valv s enough to k p the engine running, until the idle mixture and final R.P.M. adjustment can be made.

GENERAL BULLETIN

CARBURETER CONTRACT ACCOUNTS
FACTORY, P.I. AND P.C.T. GRADUATES

BULLETIN NO. 3 Ford

DATE February 17, 1958

SUBJECT: 1958 Ford V8-Slow Opening Of The Automatic Choke AFB-2640SA (4 Bore) Carbureter

A new climatic control thermostatic coil and housing assembly 170AD-478S has been released to permit the choke to open more quickly during the warm-up period. The coil housing gasket has been changed to a soft cork material to assure an air tight seal. The part number of the new gasket is 121-316. Carbureters using the new housing and gasket will be identified as 2640SC. The 170AD-478S coil is set two notches lean.

Manifold vacuum draws warm choke air through the idle bleeds in the low speed circuit to reduce carbureter icing. If a cold engine is started and allowed to warm-up at idle speed the choke valve may not open fully using either the new or old coil. This is due to the small volume of choke air passing through the idle bleeds and relatively low temperatures in the exhaust manifold stove. When the car is driven during the warm-up period the velocity of the choke air and the temperature in the manifold stove will increase opening the choke. Because of the design of the choke valve and air horn, the last few degrees of choke valve travel to the open position has no effect on the fuel mixture.

To be sure the choke is up to standard:

1. Idle the engine at 500 RPM in drive with an automatic transmission, 600 RPM in neutral with a standard transmission. Sufficient idle RPM is important to assure sufficient choke air flow. Check the vacuum at the choke hot air inlet on the carbureter. If it is below 2" of vacuum check for air leakage

   a. Between the coil housing and piston housing.
   b. Between the choke shaft and piston housing.
   c. Around the welsh plug in piston housing.
   d. Around a loose piston housing attaching screw.
   e. Between piston housing and carbureter body due to a missing gasket at the vacuum passage.

2. Check the manifold stove for cold air leaks, particularly at the four corners of the steel plate forming the top of the stove.

(over)

3. Check the fast idle adjustment by rotating the cam until the last step is under the adjusting screw. An engine at full operating temperature should then idle at 650 RPM in neutral.

An initial shipment to Carter Central Distributors is underway on parts 170AD-478S and 121-316.

Carter warranty is not involved.

CARBURETER SPECIFICATIONS

For Ford 8 Cylinder 352 Cu. In. Engine: Vacuum at Idle 19 Inches

Dimensions: Flange, four bore—4 bolt type
Throttle bore 1 9/16 inch I D
Primary venturi size 7/16 inch I D
Main venturi primary side, 1 1/8 inch I D
Main venturi, secondary side, 1-3/16 inch I D.

Vents: Inside (2) in air horn, Outside (4) in body.

Low Speed Circuit: (Primary side only)
Jet, size No 69 (0292 inch) drill.
By pass, size No 53 (0595 inch) drill
Economizer size No 57 (043 inch) drill
Idle bleed, size No 49 (073 inch) drill
Idle port, slot type, length 180 inch, width 030 inch.

Idle Port Opening: .133 to 140 inch above top edge of valve with valve tightly closed

Lower Port: (For idle adjustment screw), size 065 inch diameter

Set Idle Adjustment Screw: 1/4 to 1 3/4 turns open For richer mixture turn screw out Idle engine at 600 R P M for Std. and O. D, 500 R P M for Auto Trans in neutral

Main Nozzle: Installed permanently DO NOT REMOVE Anti-percolator bleed, primary (tube in venturi assembly) size No 70 (028 inch) drill Secondary, (drilled hole in venturi assembly) size No. 60 (040 inch) drill.

Main Vent Tube: (In venturi assembly) Side holes primary and secondary 1—size No 40 (060 inch) drill

Accelerating Pump: Discharge jet (twin) primary side only size No 70 (028 inch) drill Intake ball check seat (screw plug) size 115 to 120 inch diameter. Discharge needle seat, size 070 inch diameter.

Choke: Carter Climatic® Control set 1 point lean. Butterfly type —offset choke valve, primary side only. Choke heat suction hole, restriction in body size No 43 (089 inch) drill

Vacuum Spark Port: Horizontal slot (round end) 055 x .130 inch Top of port 035 to .045 inch above top edge of valve with valve tightly closed.

Motor Tune-Up — Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3694

FLOAT ALIGNMENT: Side of floats, parallel to edge of casting Minimum clearance between lever and air horn lugs without binding To adjust, bend float lever

FLOAT LEVEL: 5/16 inch (Gauge T109-107) between top of floats at outer end and air horn gasket To adjust, bend float lever

FLOAT DROP: 23/32 inch between top of floats at outer end and air horn gasket To adjust, bend stop tabs on float brackets

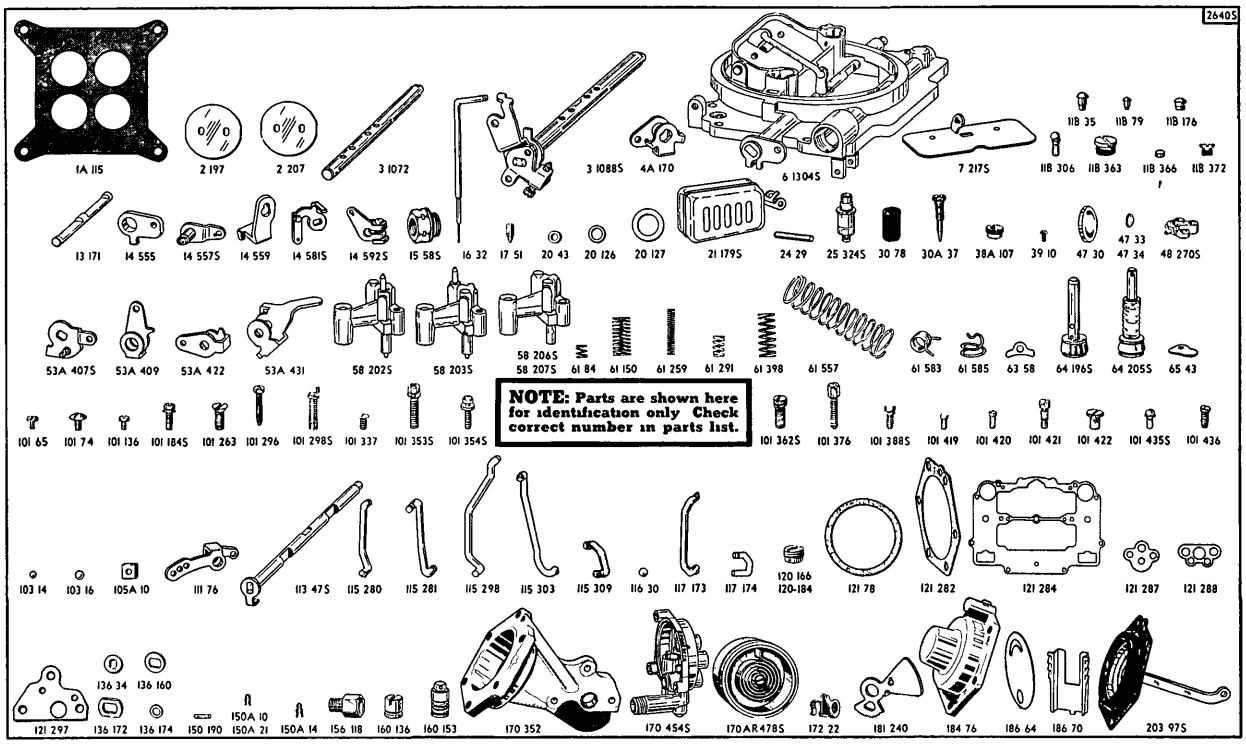
PUMP: 15/32 inch from the top of the bowl cover to the top of the plunger shaft with throttle connector rod in center hole (medium stroke) of pump arm

COUNTERSHAFT LINKAGE: (1) 086 inch (Gauge T109-215) between choke lever and stop in piston housing with choke held closed To adjust, take slack out of linkage by setting counter shaft lever (2) With slight clearance between lug on fast idle cam and stop on flange casting, and inner countershaft lever contacting lug on outer countershaft lever align index mark on cam with adjusting screw To adjust, bend fast idle connector rod

FAST IDLE THROTTLE VALVE CLEARANCE: 026 inch (Gauge T109-189) between lower edge of valve and bore with adjusting screw on index mark of cam

FAST IDLE ON CAR: 650 R P M hot engine—with fast idle screw on lowest (last) step of cam

UNLOADER: 067 inch (Gauge T109-234) between upper edge of choke valve and inner wall of air horn To adjust bend unloader arm on throttle lever



PRIMARY THROTTLE SHAFT DOG: (1) With primary throttle valves in wide open position there should be 020 inch (Gauge T109-29) clearance between edge of secondary valves and bore of carbureter adjacent to primary valves To adjust, bend upper tang on primary throttle shaft dog If clearance cannot be obtained, bend throttle operating rod slightly (2) With primary and secondary valves tightly closed there should be 067 inch (Gauge T109-234) clearance between primary throttle shaft flex spring and lower tang on primary throttle shaft dog To adjust, bend lower tang.

DASH POT: 7/16 inch from top of the bowl cover to the top of the plunger shaft with primary throttle wide open To adjust, bend stop lug on flat lever.

CARBURETER SPECIFICATIONS

For Ford 8 Cylinder Engine: 3.80 Inch Bore, 3.44 Inch Stroke

Dimensions: Flange, four bore—4 bolt type.
Throttle bore 1-7/16 inch I. D.
Primary venturi size, 11/32 inch I. D.
Main Venturi 1-1/16 inch I. D.

Vents: Inside (2) in air horn; Outside (4) in body.

Gasoline Intake: Size No. 38 (.1015 inch) drill hole in needle seat.

Low Speed Jet Tube: (In venturi assembly, primary side only).
Jet, size No. 68 (.031 inch) drill.
By-pass, size No. 53 (.0595 inch) drill.
Economizer, size (.049 inch) diameter.
Idle bleed, size No. 51 (.067 inch) drill.

Idle Port: (Upper) slot type. Primary, length .230 inch; width .030 inch. Secondary, none.

Idle Port Opening: Primary, .187 to .193 inch above top edge of valve with valve tightly closed. Secondary, none.

Lower Port: Primary (for idle adjustment screw), size early prod. .0635 inch, intermediate prod. .065 inch, late prod. .076 inch.

Set Idle Adjustment Screw: 1/2 to 1 1/2 turns open. For rich mixture turn screw out. Idle engine between 475 to 500 r.p.m (all trans.) in neutral.

Main Nozzle: Installed permanently. DO NOT REMOVE. Anti percolator bleed, primary, (tube in venturi assembly) size No 71 (.026 inch) drill. Secondary, (drilled hole in venturi assembly) size No. 60 (.040 inch) drill.

Step-Up Rod: (Vacumeter type) see parts list for size.

Metering Jet: Primary, size .0935 inch diameter (for step-up rod).
Secondary, size .0635 inch diameter (no step-up rod).

Accelerating Pump: Discharge jet (twin) primary side only size No. 68 (.031 inch) drill. Intake ball check seat (screw plug) size .115 to .120 inch diameter. Discharge needle seat size .070 inch diameter.

Choke: Carter Climatic® Control set 1 point rich. Butterfly type—offset choke valve, primary side only. Choke heat suction hole, restriction in body size No. 38 (.1015 inch), late prod. No. 44 (.086 inch) drill.

Vacuum Spark Port: Horizontal slot (round end) .055 x .130 inch. Top of port .040 to .050 inch above top edge of valve with valve tightly closed.

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3694

FLOAT ALIGNMENT: Side of floats parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding. To adjust, bend float lever.

FLOAT LEVEL: 5/32 inch (Gauge T109-154) between top of floats at outer end and air horn gasket. To adjust, bend float lever.

FLOAT DROP: 23/32 inch between top of floats at outer end and air horn gasket. To adjust, bend stop tabs on floats brackets.

PUMP: 15/32 inch from the top of the bowl cover to the top of the plunger shaft with throttle connector rod in center hole (medium stroke) of pump arm.

COUNTERSHAFT LINKAGE: (1) .086 inch (Gauge T109-215) between choke lever and stop in piston housing with choke held closed. To adjust, take slack out of linkage by setting counter shaft lever.

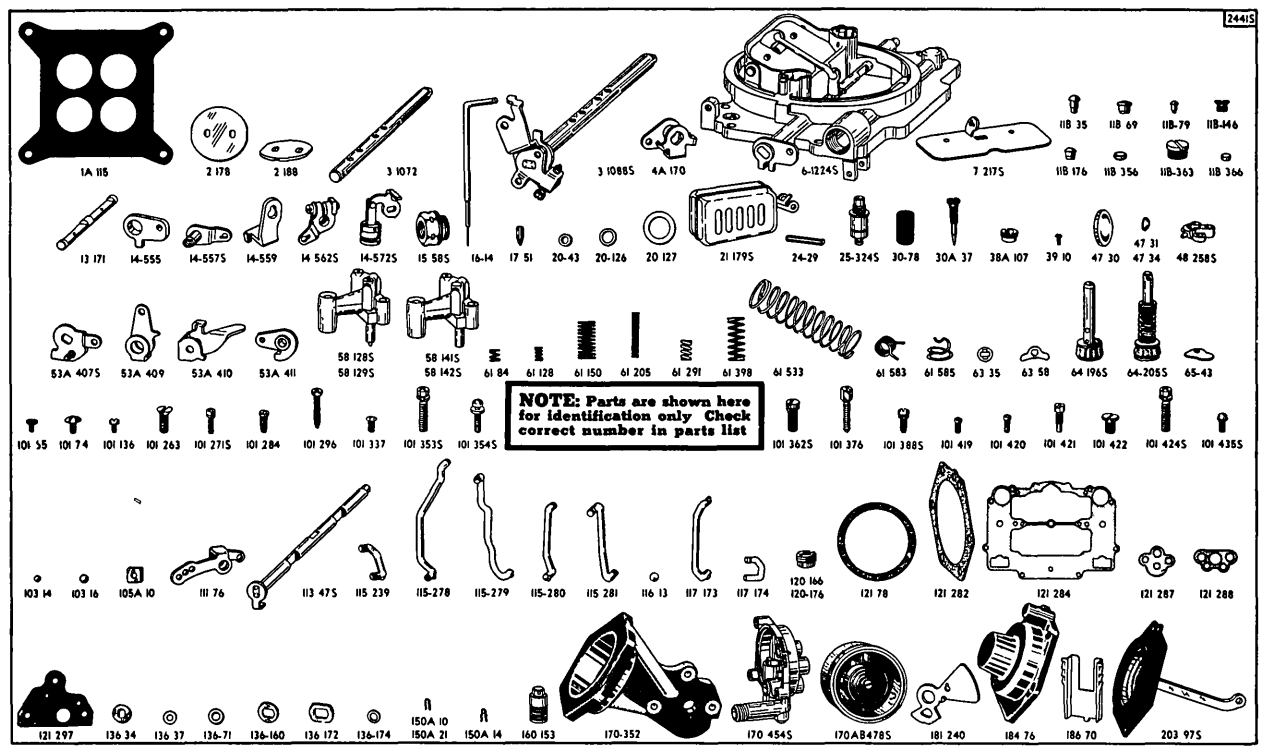
(2) .010 inch (Gauge T109-200) between lug on outer countershaft lever and stop on inner countershaft lever. To adjust, bend lug on outer countershaft lever.

Optional adjustment (late prod.) with slight clearance between lug on fast idle cam and stop on flange casting, and inner countershaft lever contacting lug on outer countershaft lever align index mark on cam with adjusting screw. To adjust bend fast idle connector rod.

FAST IDLE THROTTLE VALVE CLEARANCE: .020 inch (Gauge T109-29) between lower edge of valve and bore with adjusting screw on high step of cam.
FAST IDLE ON CAR: 1800 to 2000 R.P.M. hot engine —*with fast idle screw on high step of cam.*

UNLOADER: .067 inch (Gauge T109-234) between upper edge of choke valve and inner wall of air horn. To adjust, bend unloader arm on throttle lever.

PRIMARY THROTTLE SHAFT DOG: (1) With primary throttle valves in wide open position there should be .015 inch (Gauge T109-44) clearance between edge of secondary valves and bore of carbureter adjacent to primary valves. To adjust, bend upper tang on primary throttle shaft dog. If clearance cannot be obtained, bend throttle operating rod slightly.



(2) With primary and secondary valves tightly closed there should be .067 inch (Gauge T109-234) clearance between primary throttle shaft flex spring and lower tang on primary throttle shaft dog. To adjust, bend lower tang.

DASH POT: 7/16 inch from top of the bowl cover to the top of the plunger shaft with primary throttle wide open. To adjust, bend stop lug on flat lever.

CARTER CARBURETOR

DIVISION OF ACF INDUSTRIES INCORPORATED
ST LOUIS, MO., U. S. A.

File Under Ford

CARTER MODEL AFB CARBURETER FOR FORD (SERVICE ADJUSTMENT PROCEDURE)

NOTE: The parts and specification pages referred to are catalog pages. These pages can be obtained from Carter-Carburetor, Catalog Department, St. Louis (7), Missouri. Specify the carbureter number found on the base of carbureter, when requesting specification pages.

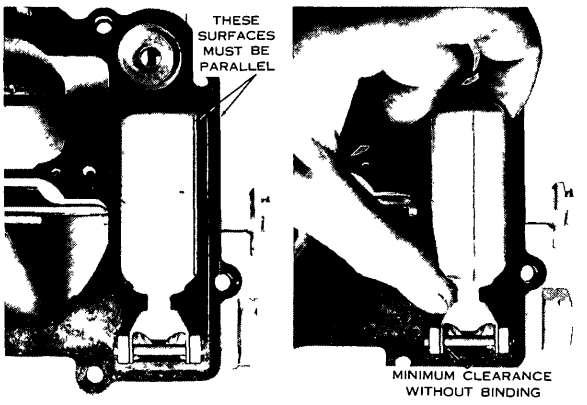

Figure 1

FLOAT ALIGNMENT ADJUSTMENT (Fig. 1)

1. Sight down the side of the float shell to determine if the side of the float is parallel to the outer edge of the air horn casting. TO ADJUST: Bend float lever by applying pressure to the end of the float shell with the fingers while supporting the float lever with the thumb.

   CAUTION: To avoid damaging the float, apply only enough pressure to bend float lever.

2. After aligning float, remove as much clearance as possible between arms of float lever and lugs on air horn by bending the float lever. Arms of float lever should be as parallel to the inner surfaces of lugs on air horn as possible.

   Floats must operate freely without excess clearance on its hinge pin.

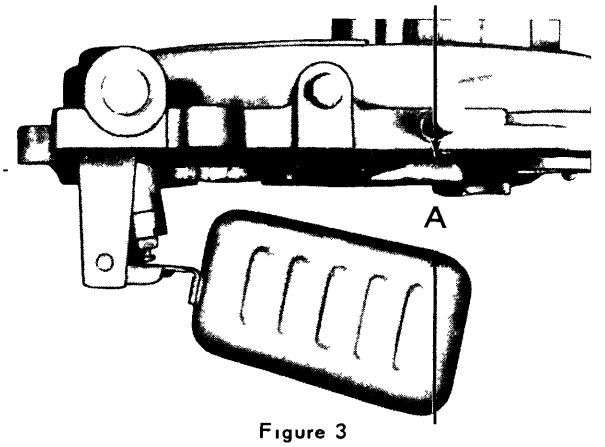

Figure 3

FLOAT DROP ADJUSTMENT (Fig. 3):

With bowl cover held in upright position and measuring from outer end of float, the distance (A) betw en top of floats and bowl cover gask t should be as listed on specification page. To adjust, bend stop tabs on float brackets.

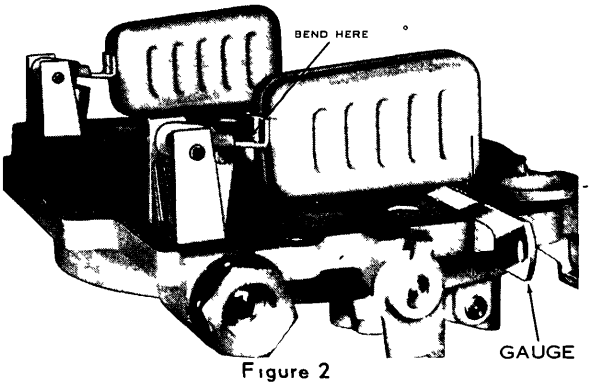

Figure 2

FLOAT LEVEL ADJUSTMENT (Fig. 2):

With air horn inverted, bowl cover gasket in place and needle seated, there should be the clearance as listed on carburetor specification page between outer end of float and air horn gasket. To adjust, bend float arm. Adjust both floats. Recheck float alignment.

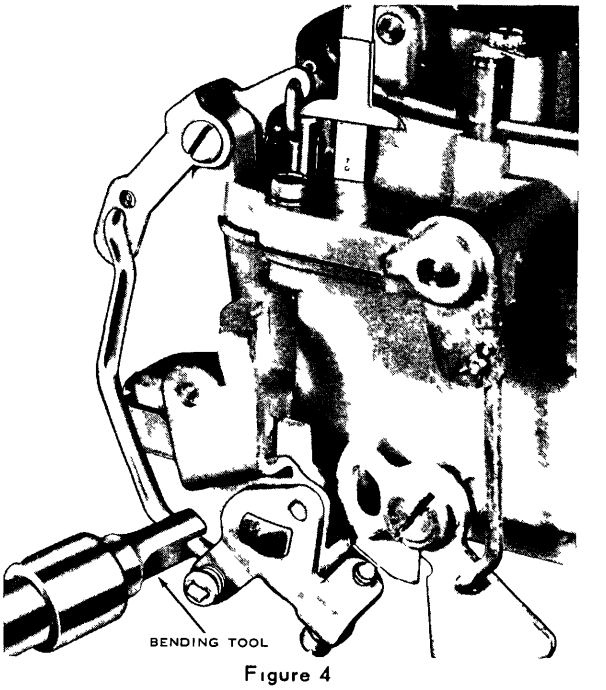

Figure 4

PUMP ADJUSTMENT (Fig. 4)

1. Back out idle speed screw until throttl valves seat in bores of carburetor. NOTE: Be sure choke is wide open so fast idle cam does not hold throttle valve open.
2. With throttle c nnector rod in center hole (medium stroke) of pump arm, the distance from the top of the bowl cover to the top f th plunger shaft should be as sp cified on carburetor specification page.
3. Adjust by bending throttle connector rod at lower angle (use tool T109-213).

CARBURETER
TRADE MARK REG U S PAT. OFF.
MARCA REGISTRADA

Printed in U.S.A.

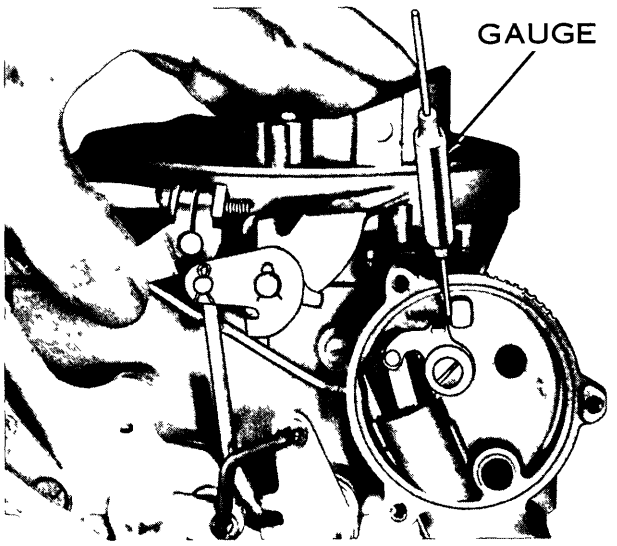

Figure 5A

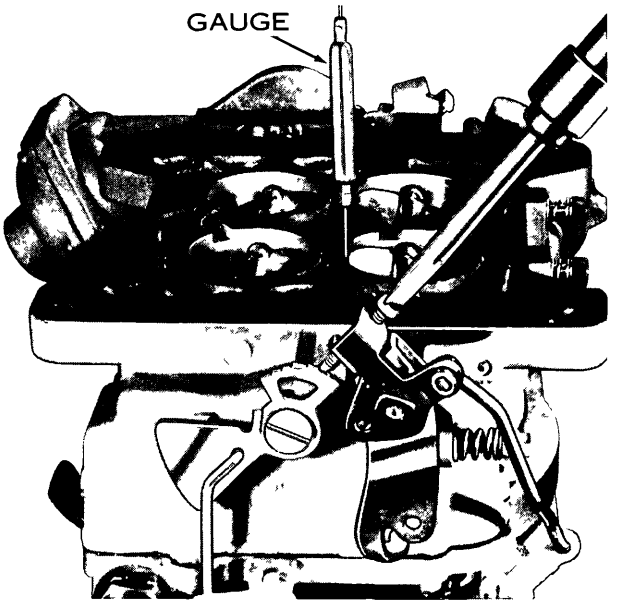

Figure 6

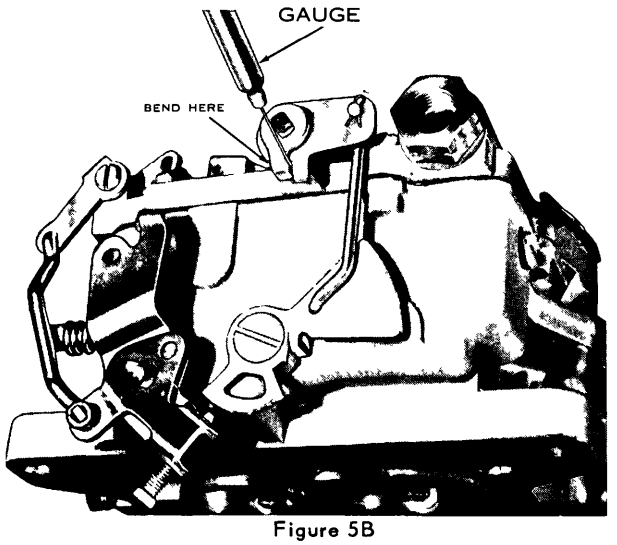

Figure 5B

COUNTERSHAFT LINKAGE ADJUSTMENT (Figs. 5A & 5B):

1. Loosen countershaft lever clamp screw. Take end play out of countershaft, and hold choke valve tightly closed. Take slack out of linkage by pressing countershaft lever towards closed position with gauge in place between choke lever and stop in piston housing. Hold in place and tighten clamp screw. (Fig. 5A)
2. A. Hold choke valve tighly closed.
   B. Hold fast idle cam against stop on casting.
   C. The clearance between lug on outer countershaft lever and stop on inner countershaft lever should be as listed on carburetor specification page. TO ADJUST: Bend lug on outer countershaft lever. (Use tool T109-214) (Fig. 5B)

FAST IDLE THROTTLE VALVE CLEARANCE ADJUSTMENT (Fig. 6):

With choke valve tightly closed, tighten fast idle adjusting screw (on high step of cam) until there is the clearance as listed on carburetor specification page between throttle valve and bore of carburetor, side opposite idle port.

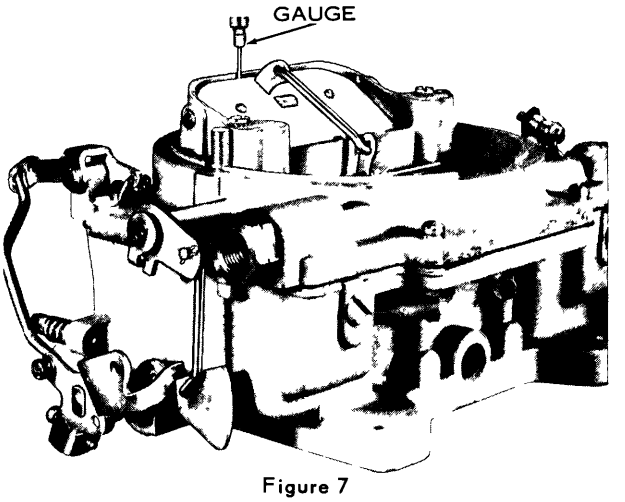

Figure 7

UNLOADER ADJUSTMENT (Fig. 7):

With throttle wide open the rear should be the clearance as listed on carburetor specification page between upper edge of choke valve and inner wall of air horn. To adjust, bend unloader lip on throttle shaft lever. (Use tool T109-214)

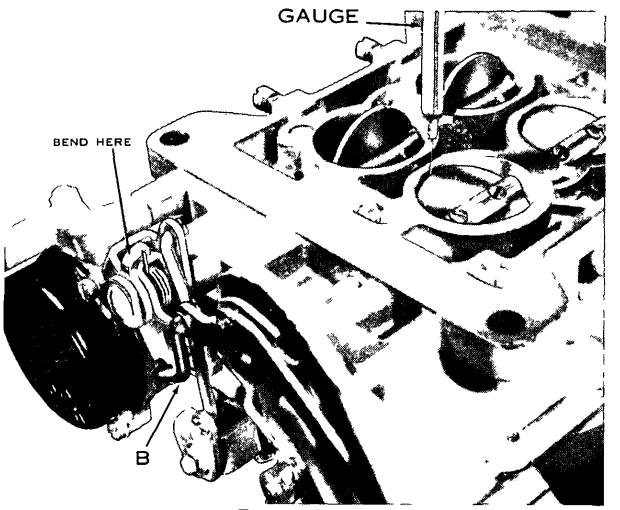

Figure 8A

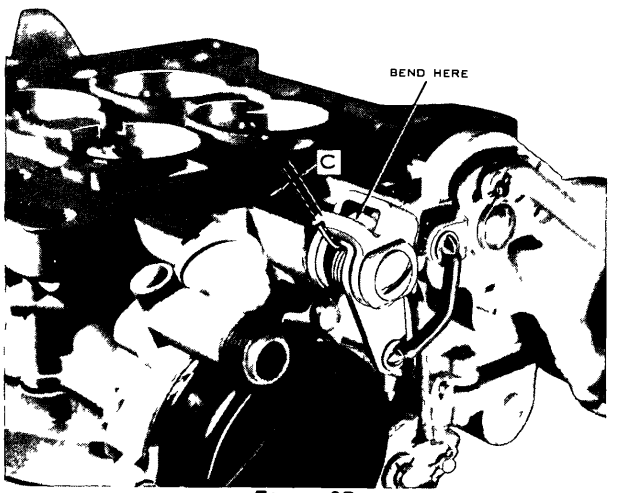

Figure 8B

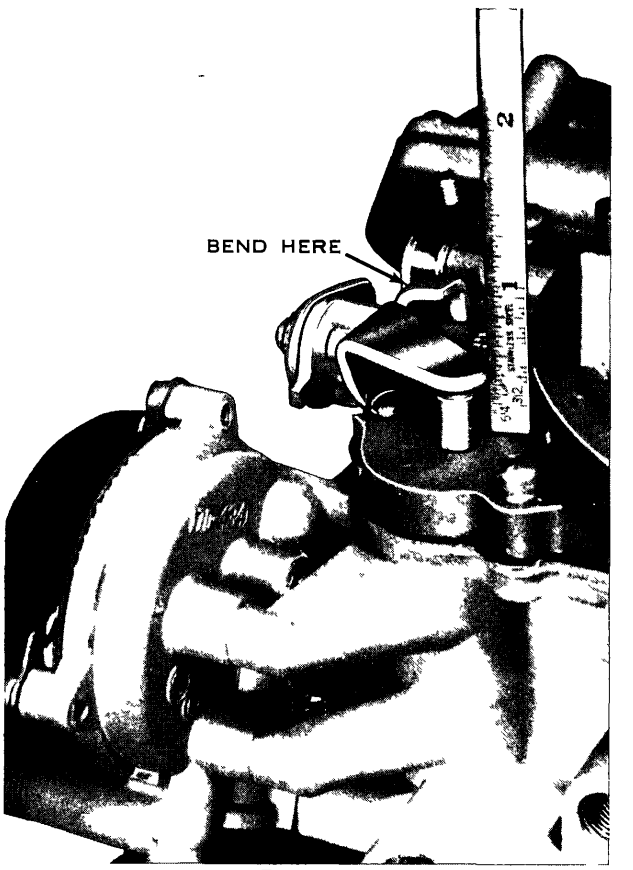

Figure 9

DASH POT ADJUSTMENT (Fig. 9):

With primary throttle valves in wide open position there should be the distance as listed on specification page between the top surface of the bowl cover and the top of the plunger shaft. To adjust, bend lug. (Use bending tool T109-22)

PRIMARY THROTTLE SHAFT DOG ADJUSTMENT (Figs. 8A & 8B):

1. With primary throttle valves in wide open position there should be the clearance as listed on specification page between edge of secondary valves and bore of carburetor adjacent to primary valves. To adjust, bend tang. (Use bending tool T109-213). If proper clearance between secondary valves and bore cannot be obtained, bend throttle operating rod (B) (Fig. 8A).

2. With primary and secondary throttle valves in tightly closed position there should be the clearance (C) between primary throttle shaft flex spring and tang as listed on specification page. To adjust, bend tang. (Use bending tool T109-213) (Fig. 8B)

NOTE: See last page for pertinent service information.

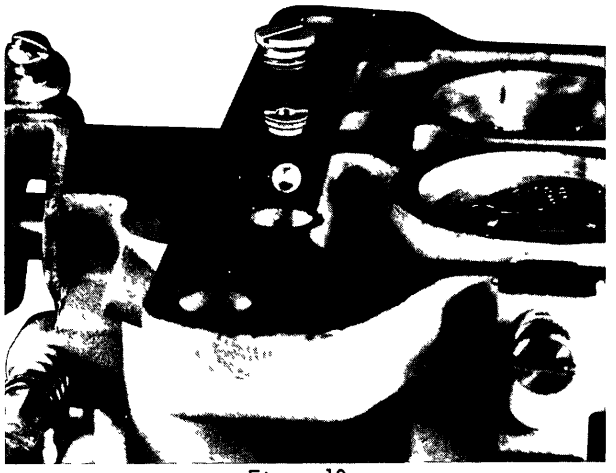

Figure 10

(Fig. 10)

Pump intake check ball, seat and screw plug are removed by inverting carbureter and removing from lower side of flange.

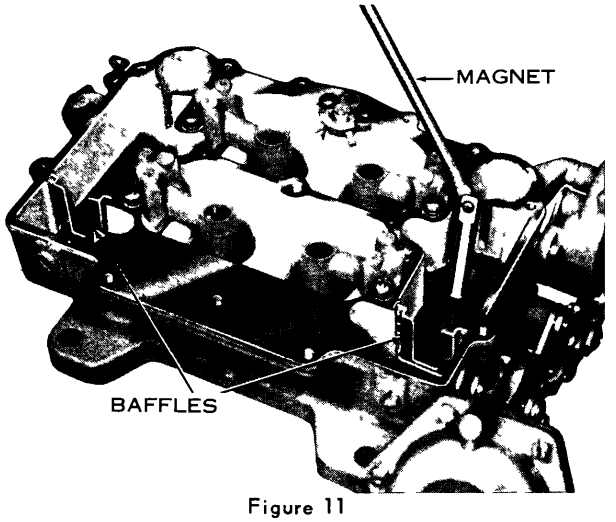

Figure 11

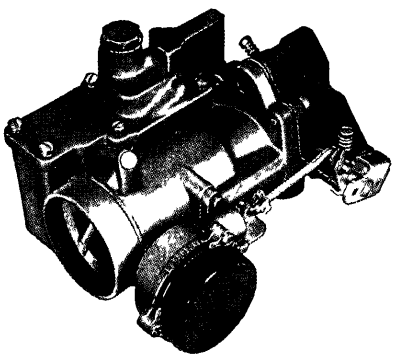
(Fig. 11)

Flooding, stumble on acceleration and other performance complaints are, in many instances, caused by the presence of dirt, water or other foreign matter in the carbureter. To aid in diagnosing the cause of the complaint, the carbureter should be carefully removed from the engine without draining the fuel from the bowl. The contents of the fuel bowl may then be examined for contamination as the carbureter is disassembled.



Check the fuel in the bowl for contamination by dirt, water, gum or other foreign matter. A magnet moved through the fuel in the bowl will pick up and identify any iron oxide dust that may have caused intake needle and seat leakage. (See Fig. 11.)

Inspect gasketed surfaces between body and air horn. Small nicks or burrs should be smoothed down to eliminate air or fuel leakage. Be especially particular when inspecting the top surface of the inner wall of the bowl around the vacuum piston passage. A poor seal at this location may contribute to a "cutting-out" on turns complaint.

Install fuel baffles as shown (Fig. 11) to prevent damage to floats.

Fill the carbureter bowl with clean fuel before installing on the manifold. This will help prevent dirt trapped in the fuel system from being dislodged by the free flow of fuel as the carbureter is primed. The operation of the floats and intake needle and seats may be checked under pressure if a fuel pump is used at the bench to fill the carbureter bowl. Operate the throttle several times and visually check the discharge from the pump jets.

Before installing the carbureter, hold choke valve open and turn the idle speed screw until it just contacts the throttle lever, then 1/2 of a turn more to open the throttle valves enough to keep the engine running until the idle mixture and final R.P.M. adjustment can be made.

GRAY MARINE

"FIREBALL 8" MODELS 135 and 170 1959

(Use 2618S with 120-158 to replace 2935S for service.)

YH Horizontal Climatic® Control **Carbureter No. 2935S**

CARBURETER SPECIFICATIONS

For Gray Marine 8 Cylinder 250 Cu. In. Engines: Vacuum at Idle 18 Inches

Dimensions: Flange size 1¼ inch 3 bolt
Primary venturi 11/32 inch I D
Secondary venturi, 11/16 inch I D
Main venturi 1-5/16 inch I D

Vents: Outside, none Inside balance vent tube to air horn ahead of choke valve

Gasoline Intake: Spring loaded needle Size No 48 (076 inch) drill hole in needle seat

Low Speed Jet Tube: Jet size No 69 (0292 inch) drill
By pass in body size No 56 (0465 inch) drill
Economizer, size (051 inch) diameter

Idle Port: Upper port slot type length 162 inch Width 030 inch

Idle Port Opening: Top of port 124 to 128 inch above top edge of valve with valve tightly closed Lower port size 0615 to 0655 inch diameter (for idle adjusting screw)

Set Idle Adjustment Screw: ¼ to 1¾ turns open For richer mixture, turn screw out Do not idle engine below 500 r p m (in neutral)

Main Nozzle: In primary venturi DO NOT REMOVE Anti-percolating jet (in tube) to nozzle size No 70 (028 inch) drill

Accelerating Pump: Diaphragm type vacuum and mechanically operated Discharge (pump) jet size No 70 (028 inch) drill Intake ball check (in diaphragm housing) seat size 115 120 inch diameter Discharge needle check (in body) seat size 092 inch diameter Vacuum passage restriction (in body) size No 46 (081 inch) drill Vacuum bleed (to throttle bore) size No 65 (035 inch) drill

Choke: Carter Climatic® Control set on index Butterfly type, offset choke valve Choke heat suction hole in piston housing size No 42 (0935 inch) drill

Vacuum Spark Port. Slot type Size 125 by 041 inch Bottom of horizontal port 026 to 036 inch above top edge of valve in closed position

Motor Tune-Up—Be Accurate!

CAUTION Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .016"	Ignition Timing Breaker Points to Open: 15° B. T. D. C. At Flywheel	Valve Setting (Hot) Intake .016" Exhaust .018"	Float Setting 9/16 Inch (Use gauge T109-84)	Idle Adjustment Screw Setting ¼ to 1¾ Turns Open Idle Engine at 500 R.P.M.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: With gasket removed, bowl cover assembly inverted and float resting on pin in seated needle, the distance from the bowl cover to the top of float should be 9/16 inch (gauge T109-84) Do not depress float lip against spring loaded pin in needle, but let float rest on its own weight Adjust by bending float lever Float setting must be checked with bowl cover held at eye height in a level position

FLOAT DROP: With bowl cover assembly held in upright position, the distance between bottom of float (at free end) and bowl cover should be 2⅜" Adjust by bending stop tab on float arm

METERING ROD ADJUSTMENT: This adjustment is important and should be checked each time the carbureter is reassembled Insert gauge (T109-104) in place of metering rod, seating tapered end of gauge in metering rod jet Hold gauge vertical to insure seating in jet With throttle valve tightly closed, press down on diaphragm shaft until metering rod arm contacts lifter link at diaphragm stem With diaphragm shaft held in this position, metering rod pin must rest lightly on metering rod gauge To adjust, bend metering rod arm Use bending tool T109-22

ACCELERATING PUMP: If acceleration is not satisfactory, remove pump housing, intake rivet plug and ball check

CARBURETER
TRADE MARK REG U S PAT OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.

Examine diaphragm for wear or damage Be sure intake check ball and discharge check needle seats are not clogged with lint or foreign matter Intake ball check and discharge needle must seat, as a leak at these points will result in poor acceleration Inspect and replace all worn parts, clean and blow out all passages with compressed air Pump jet is permanently installed do not remove

UNLOADER ADJUSTMENT. This adjustment must be made after fast idle adjustment Hold throttle valve in wide open position and close choke valve as far as possible without forcing There should be 5/64 inch clearance between lower edge of choke valve (vent tube side) and inner wall of air horn (gauge T109-85) Adjust by bending choke shaft unloader arm (Use bending tool T109 105)

WGD Dual Down-Draft Climatic® Control **Carbureters Nos. 2352S-2352SA**

CARBURETER SPECIFICATIONS

For Hudson-Nash 8 Cylinder Engine: 3½ Inch Bore, 3 Inch Stroke

Dimensions. Flange size, 1¼ inch dual 4 bolt type
Primary venturi 11/32 inch I D
Secondary venturi, 21/32 inch I D
Main venturi, 1-3/16 inch I D

Vent. Outside none Inside balance vent tube above choke valve

Gasoline Intake. Size No 35 (110 inch) drill in needle seat

Low Speed Jet Tube: Jet size No 66 (033 inch) drill By pass in bowl cover size No 54 (055 inch) drill Economizer, in bowl cover size No 56 (0465 inch) drill Idle bleed in bowl cover size No 54 (055 inch) drill

Idle Port: Upper slot type, length 160 inch width 030 inch

Idle Port Opening 109 to 115 inch above top edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw): Size 065 to 069 inch diameter

Set Idle Adjustment Screw: 1 to 2 turns open For richer mixture turn screw out Do not idle engine below 450 to 500 R P M. (Automatic Trans—In Neutral), 500 to 550 R P M (Standard and Overdrive Trans) For cars with air conditioning set idle at 500 R P M with compressor in operation

Nozzle: Nozzle is installed permanently DO NOT REMOVE Anti percolating well bleed, size No 71 (026 inch) drill

Metering Rod (Vacumeter Type): See parts list for size

Metering Rod Jet· Size 086 inch diameter

Accelerating Pump Discharge jet (twin) size No 72 (025 inch) drill Intake ball check, in plunger shaft Discharge (needle seat) size No 50 (070 inch) drill

Choke Carter Climatic® Control—set on index, butterfly type offset valve Choke heat suction hole in piston housing size No 42 (0935 inch) drill

Vacuum Spark Port Horizontal slot (round end) 040 x 130 inch Bottom of port to be 018 to 024 inch above upper edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting 016"	Ignition Timing Breaker Points to Open 5° B. T. D. C. At Vibration Damper	Float Setting 7/32 Inch (Use Gauge T109-106)	Idle Adjustment Screw Setting 1 to 2 Auto. Trans. 450 to 500 R.P.M. Std. & O'Drive 500 to 550 R.P.M.

NOTE· These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT.

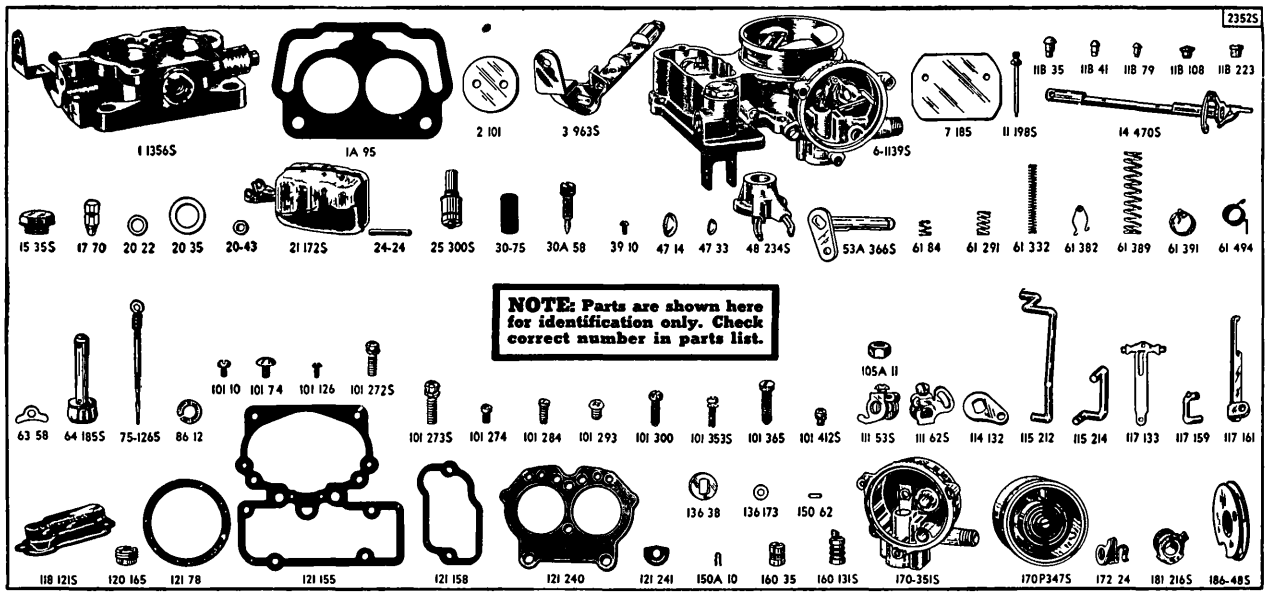
CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: With bowl cover gasket removed, bowl cover inverted and needle seated, there should be 7/32 inch (gauge T109 106) between top of float and bowl cover Adjust by bending float arm

PUMP ADJUSTMENT: Back out throttle lever set screw until throttle valves seat in bores of carbureter Hold straight edge across top of dust cover at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at upper angle Use bending tool T109 213

METERING ROD ADJUSTMENT: The metering rods must be adjusted after the pump adjustment No metering rod gauges are necessary, procedure is as follows· With the throttle lever set screw backed out and throttle valves seated in bores of carbureter, press down on vacumeter link until metering rods bottom in casting With rods held in this position, revolve metering rod arm until lip contacts vacumeter link Hold in place and carefully tighten metering rod arm set screw

FAST IDLE ADJUSTMENT: With the thermostatic coil housing gasket and baffle plate removed, crack throttle valve and hold choke valve closed Then close throttle There should now be 023 inch clearance (gauge T109-189) between throttle valve and bore of carbureter (side opposite idle port). Adjust by bending the choke connector rod at lower angle



FAST IDLE ON CAR· 1700 to 1800 (Hot)

UNLOADER ADJUSTMENT: This adjustment must be made after fast idle adjustment Hold throttle valve in wide open position and close choke valve as far as possible without forcing There should be 3/16 inch (gauge T109-28) clearance between upper edge of choke valve and inner wall of air horn Adjust by bending choke shaft unloader arm (Use bending tool T109-213.)

GENERAL BULLETIN

ALL CARBURETER ACCOUNTS

BULLETIN NO. 11 NASH-HUDSON

DATE September 28, 1956

SUBJECT: 1956 RAMBLER, CARTER AS-2349S
CARBURETER - REPAIR KIT 1816
NEEDLE AND SEAT CHANGE

Late production AS-2349S carbureters use the 25-313S needle and seat assembly. This change was made to provide more consistent float and intake needle operation, and to eliminate possibility of interference between the float lever and the needle seat, or the carbureter casting.

The parts and service specification page for the AS-2349S originally specified the 25-48S needle and seat assembly. Repair parts package 1816 for servicing this unit contains the 25-48S needle and seat.

It is important that the 25-313S needle and seat be used when servicing this model carbureter.

All repair parts packages No. 1816 in field stocks should be changed over to the 25-313S needle and seat. When this change is made, the repair parts package should be marked 1816A. The price does not change.

Please order an adequate quantity of 25-313S needle and seat and 1816A repair parts package labels for this change-over. 25-48S is a fast moving item. Those removed should be placed in loose parts stock.

AS Down-Draft Climatic® Control **Carbureter No. 2349S**

CARBURETER SPECIFICATIONS

For Hudson-Nash 6 Cylinder Engine: 3⅛ Inch Bore, 4¼ Inch Stroke

Dimensions: Flange size, 1½ inch S A E
Throttle bore, 1-9/16 inch I D
Primary venturi, ⅜ inch I D
Main venturi, 1¼ inch I D

Vents: Outside, none Inside balance vent to air horn above valve

Gasoline Intake: Horizontal needle Size No 44 (086 inch) drill in needle seat

Low Speed Jet Tube: Jet size No 70 (028 inch) drill By-pass (2), in idle tube plug, size No 58 (042 inch) drill
Economizer size 053 inch diameter Idle bleed in body, size No 66 (033 inch) drill

Idle Port: Upper port, slot type length 065 inch width 030 inch

Idle Port Opening: Top of port 058 to 062 inch above top edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw): Size No 52 (0635 inch) drill Auxiliary idle feed No 52 (0635 inch) drill

Set Idle Adjustment Screw: ¼ to 1½ turns open For richer mixture, turn screw out Do not idle engine below 475 R P M (Automatic Trans), 550 R P M (Standard and Overdrive Trans).

Main Nozzle: Nozzle is installed permanently DO NOT REMOVE Anti-percolator jet tube off center in plug size No 60 (040 inch) drill

Power Jet: Size 076 inch diameter

Power Jet Rod: Size Economy step 074 inch diameter, power step, 059 inch diameter

Metering Rod: 062 inch diameter

Metering Rod Jet: 098 inch diameter

Accelerating Pump: Pressure type mechanically operated Pump jet size No 70 (028 inch) drill Intake, disk check seat (in plunger assembly) size No 40 (098 inch) drill Discharge ball check seat (in body) size No 42 (0935 inch) drill

Choke: Carter Climatic® Control, set one point lean Offset butterfly type Choke heat suction hole in air horn size No 36 (1065 inch) drill.

Vacuum Spark Port. Round type, 052 inch diameter Top of port to be 033 to 043 inch above top edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

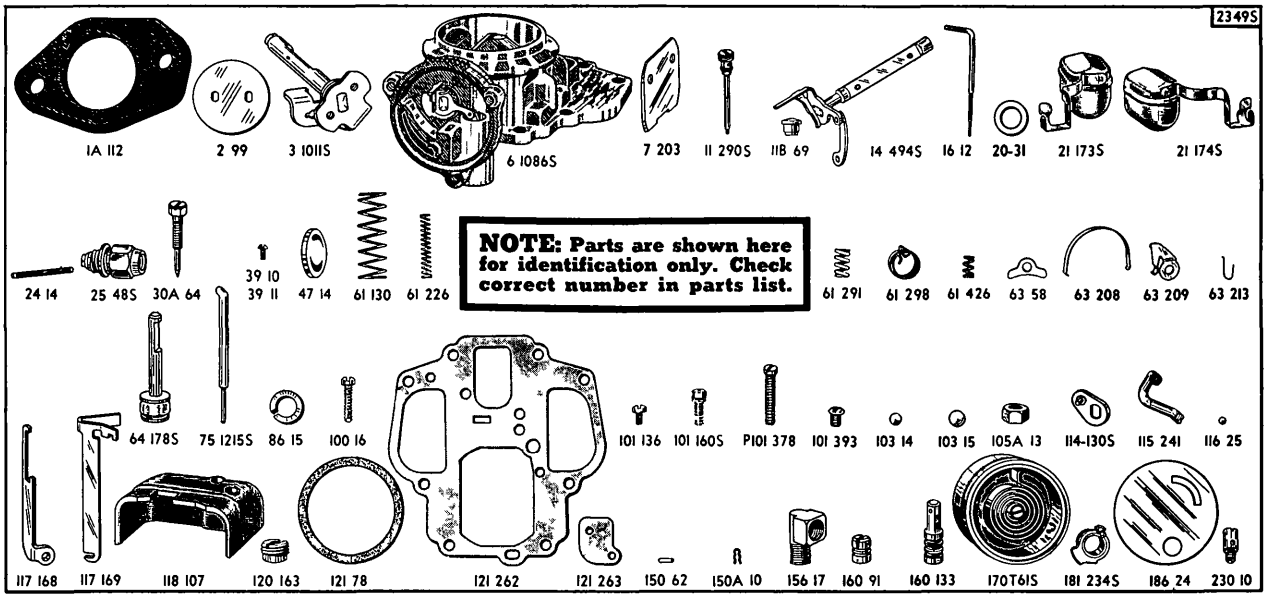
Spark Plug Gap .030"	Breaker Point Setting .020"	Ignition Timing Breaker Points to Open. T. D. C. At Vibration Damper	Valve Setting (Hot) Intake .012" Exhaust .016"	Float Setting ¼ Inch (Use Gauge T109-282)	Idle Adjustment Screw Setting ¼ to 1½ Auto. Trans. 475 R.P.M. Std. & O'Drive 550 R.P.M.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3662

Float ¼" (Gauge T109-282) from top of each float (at free end) to top of casting
To adjust Bend float lip
After float adjustment has been made there should be 010" to 015" clearance between overlapping tangs on float levers
To adjust bend long tang on left hand float

Pump Pump arm on lifter link should parallel top of casting
To adjust Bend pump arm



Metering Rod: Rod should just bottom at wide open throttle
To adjust Bend metering rod arm.

Fast Idle: 043" (Gauge T109-158 may be used) between lower edge of valve and bore with fast idle link on high step of cam
To adjust Bend choke connector rod

Unloader: 3/16" (Gauge T109 28) between top edge of valve and inner wall of air horn
To adjust Bend arm on choke trip lever

CARBURETER ADJUSTMENTS

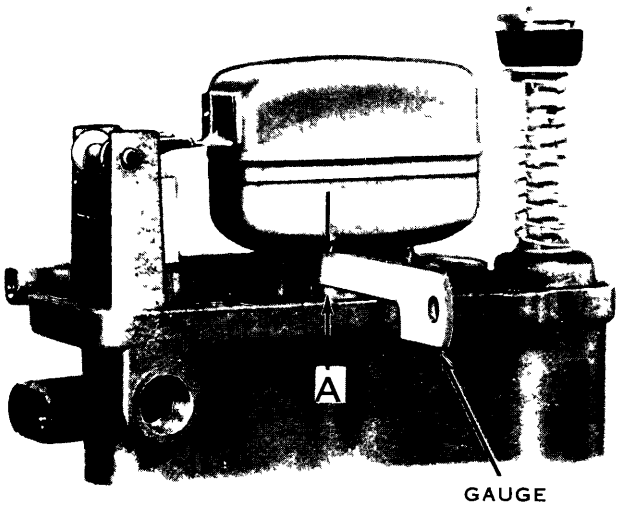

Figure 1
Float Adjustment

FLOAT ADJUSTMENT (Fig. 1):

With bowl cover gasket removed, bowl cover inverted and needle seated, there should be 1/4 inch (A) (gauge T109-31) between top of float and bowl cover Adjust by bending float arm

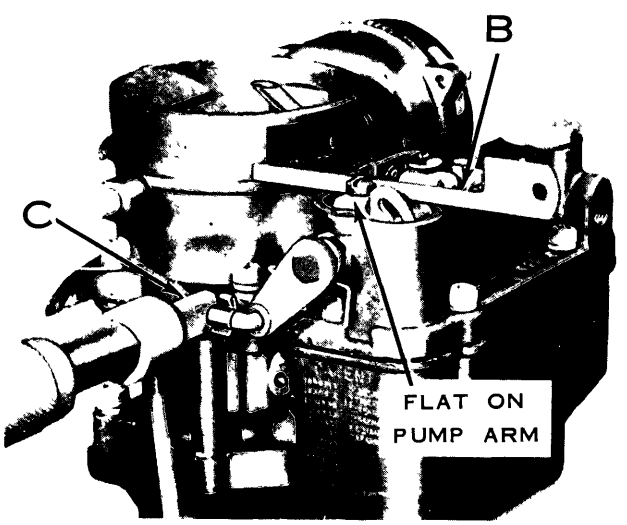

Figure 2
Pump Adjustment

PUMP ADJUSTMENT (Fig. 2):

Back out throttle lever set screw until throttle valves seat in bores of carbureter Hold straight edge (B) across top of dust cover at pump arm. The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at upper angle (C). Use bending tool T109-213.

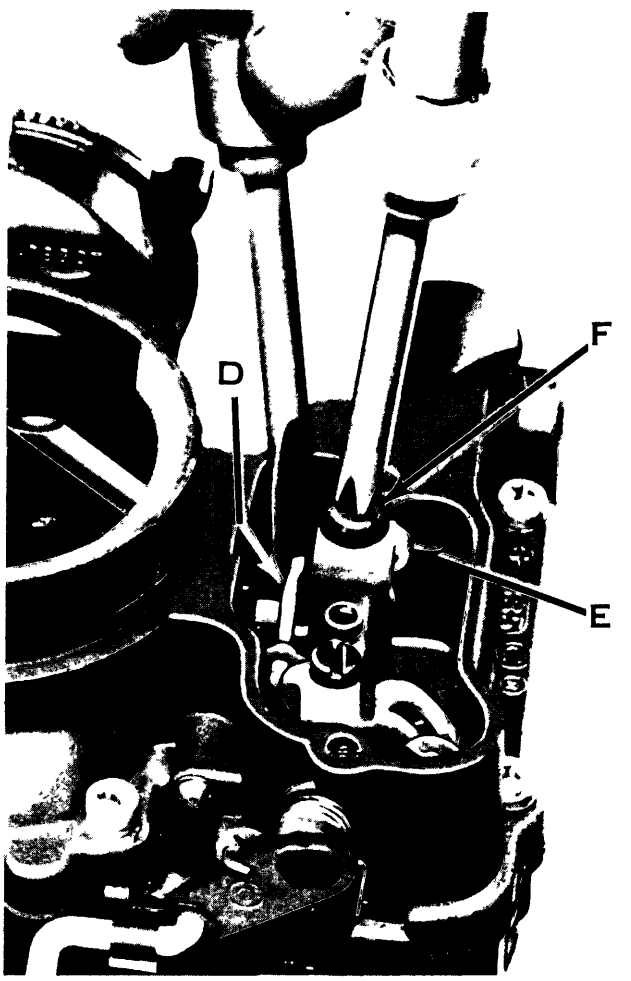

Figure 3
Metering Rod Adjustment

METERING ROD ADJUSTMENT (Fig. 3):

The metering rods must be adjusted after the pump adjustment No metering rod gauges are necessary: procedure is as follows With the throttle lever set screw backed out and throttle valves seated in bores of carbureter, press down on vacumeter link (D) until metering rods bottom in casting With rods held in this position, revolve metering rod arm (E) until lip contacts vacumeter link. Hold in place and carefully tighten metering rod arm set screw (F).

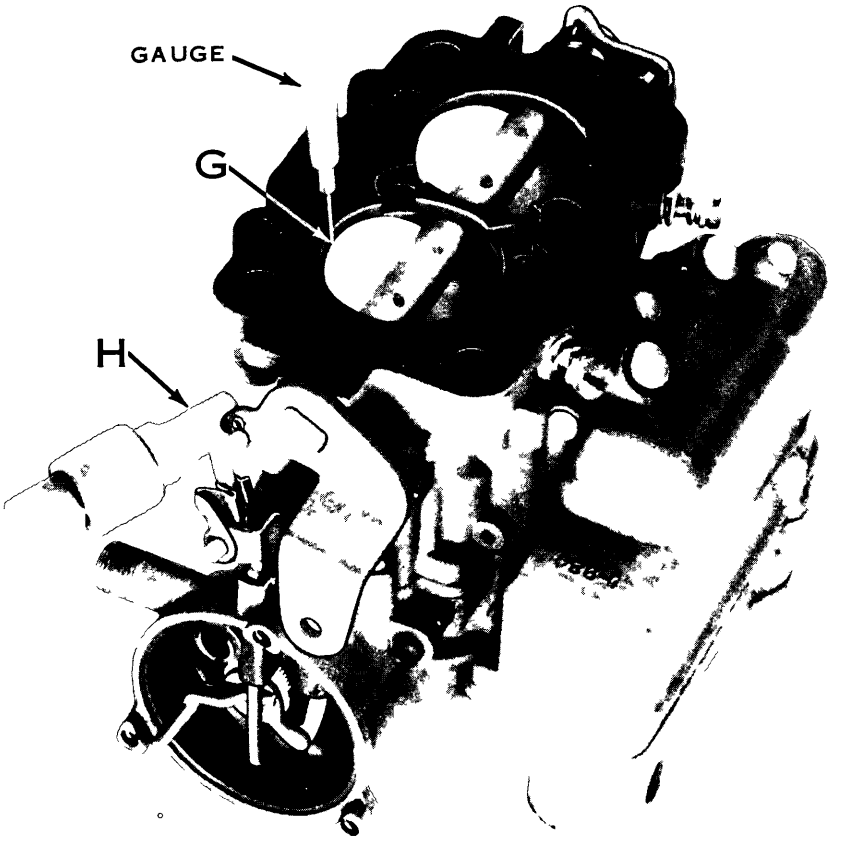

Figure 4
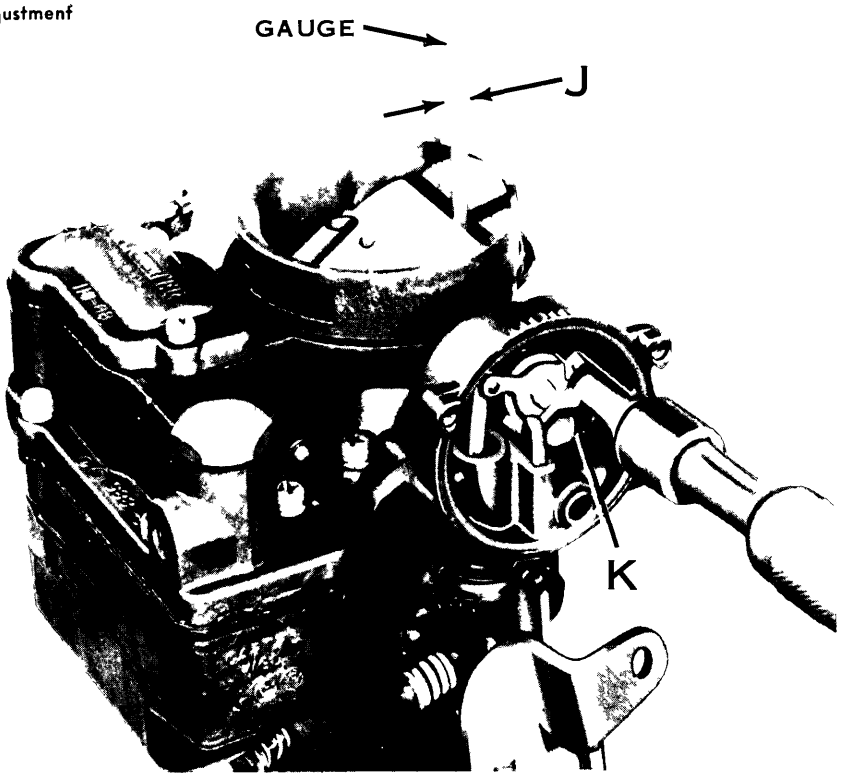
Fast Idle Adjustment

FAST IDLE ADJUSTMENT (Fig 4)

With the thermostatic coil housing gasket and baffle plate removed crack throttle valve and hold choke valve closed Then close throttle There should now be 030 inch clearance (G) (gauge T109 29) between throttle valve and bore of carbureter (side opposite idle port) Adjust by bending the choke connector rod at lower angle (H)



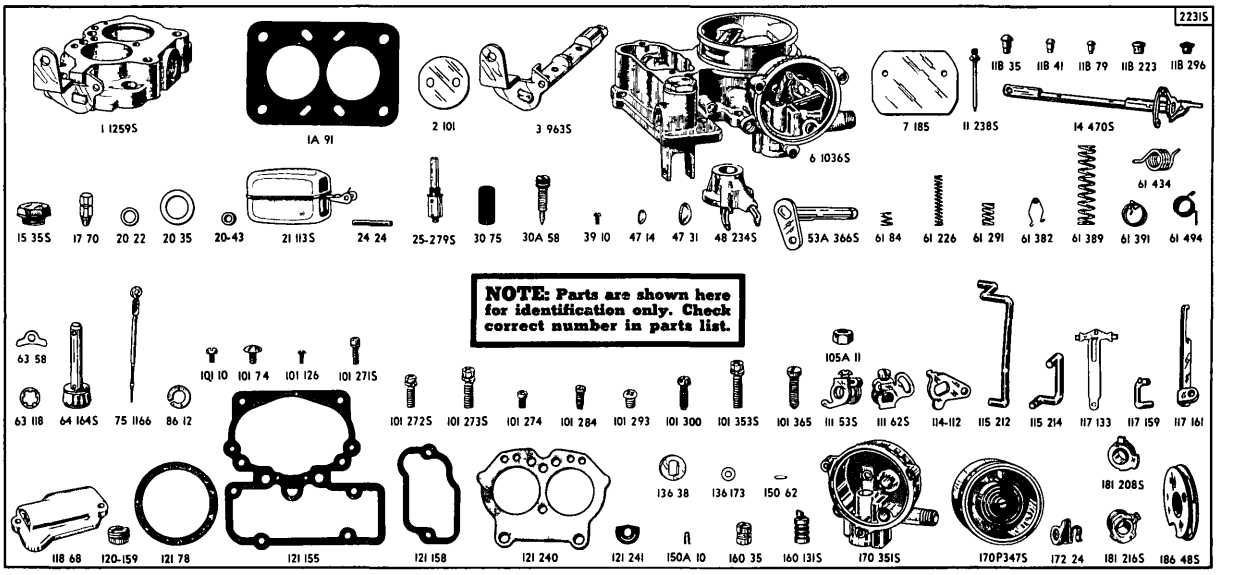


Figure 5
Unloader Adjustment

UNLOADER ADJUSTMENT (Fig 5)

This adjustment must be made after fast idle adjustment Hold throttle valve in wide open position and close choke valve as far as possible without forcing There should be 3/16 inch (gauge T109 28) clearance (J) between upper edge of choke valve and inner wall of air horn Adjust by bending choke shaft unloader arm (K) (Use bending tool T109 213)

Hudson 8—1955-1956—Carbureters Nos. 2231S-2231SA

WHEN SERVICING, USE GASKET ASSORTMENT No. 249, REPAIR PACKAGE No. 1802A

HUDSON "HORNET" 1955-1956

WGD Dual Down-Draft Climatic® Control **Carbureter No. 2252S**

CARBURETER SPECIFICATIONS

For Hudson 6 Cylinder Engine: 3.8125 Inch Bore, 4.500 Inch Stroke

Dimensions: Flange size, 1 1/4 inch dual, 4 bolt type.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 21/32 inch I. D.
Main venturi, 1-3/16 inch I. D.

Float Level: See adjustments.

Vents: Outside, none. Inside, balance vent tube above choke valve.

Gasoline Intake: Size No. 42 (.0935 inch) drill in needle seat.

Low Speed Jet Tube: Jet, size No. 67 (.032 inch) drill.
By pass, in bowl cover, size No. 53 (.0595 inch) drill.
Economizer, in bowl cover, size .0453 inch diameter.
Idle bleed, in bowl cover, size No. 53 (.0595 inch) drill.

Idle Port: Upper, slot type, length .167 inch, width .030 inch.

Idle Port Opening: .112 to .118 inch above top edge of valve with valve tightly closed.

Lower Port (For Idle Adjustment Screw): Size .065 to .069 inch diameter.

Set Idle Adjustment Screw: 1 3/4 to 2 3/4 turns open. For richer mixture turn screw out. Do not idle engine below 490 R.P.M. (automatic trans. in neutral); 540 R.P.M. (std. trans.); 575 R.P.M. (overdrive trans.).

Nozzle: Nozzle is installed permanently. DO NOT REMOVE. Anti-percolating well jet, size No. 71 (.026 inch) drill.

Metering Rod (Vacumeter Type): Economy step, .063 inch diameter. Middle step tapers to .060 inch diameter. Power step .052 inch diameter. These rods designed with idle stabilizing flats on economy step.

Metering Rod Jet: Size .086 inch diameter.

Metering Rod Setting: See adjustments.

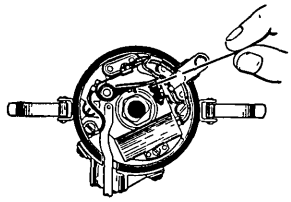
Accelerating Pump: Discharge jet (twin) size No. 70 (.028 inch) drill

Pump jet air bleed passage to outside, 1/8 inch drill.
Intake ball check, in plunger shaft.

Discharge (needle seat) size No. 50 (.070 inch) drill.

Pump Adjustment: See adjustments.

Choke: Carter Climatic® Control—set on index. Butterfly type, offset valve. Choke heat suction hole in piston housing, size No. 42 (.0935 inch) drill.



Vacuum Spark Port: Horizontal slot (round end) .045 x .110 inch. Top of port to be .028 inch above upper edge of valve with valve tightly closed.

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT With bowl cover inverted and float resting on seated needle, the distance from the tip on the edge of the bowl cover to the soldered edge of the seam should be ⅛ inch (gauge T109-83 for 2009S) and 7/16 inch (gauge T109-81 for 2009SA) To adjust, bend lip on float arm

PUMP ADJUSTMENT With throttle valve seated and connector link in lower hole (medium stroke), pump plunger should travel 16/64 inch from closed to wide open throttle position Measure pump travel by using Universal pump travel gauge T109-117S Place base of the gauge on ridged portion of bowl cover so that projecting portion of pump gauge rests on top surface of connector link at pump shaft Hold gauge vertical The difference between the numbers shown by index mark on gauge at wide open and closed throttle position should be '16 (16/64 inch) Adjust by bending throttle connector rod at lower angle

METERING ROD ADJUSTMENT Correct setting of metering rod is important and must be made after pump adjustment or when leaner than standard rods are installed Insert gauge (T109-102 for 2009S) or (T109-241 for 2009SA) in place of metering rod, seating tapered end of gauge in metering rod jet Hold gauge vertical to insure seating in jet With throttle valve seated, press down on piston link directly over piston until it contacts the pump arm There should now be less than 005 inch clearance between metering rod pin and shoulder in notch of gauge Gauge must not drag on pin Adjust by bending lip on piston link (use tool T109-105) Remove gauge and install metering rod, disc, pin and spring

ANTI-PERCOLATOR ADJUSTMENT Crack throttle valve 030 inch by placing gauge T109-29 between throttle valve and bore of carbureter (side opposite idle port) Bend rocker arm (use tool T109-105) until there is a clearance of 010 inch between rocker arm lip and pump arm

FAST IDLE ADJUSTMENT With fast idle cam in normal idle position tighten throttle lever adjusting screw until it just seats against cam Hold throttle lever closed and pull cam back until first (or lower) step is against (not on) set screw

HUDSON
RAMBLER SIX
1955

YF Down-Draft Climatic® Control **Carbureter No. 2014S**

CARBURETER SPECIFICATIONS

For Hudson Six Cylinder Engine: 3 1/8 Inch Bore, 4 1/4 Inch Stroke

Dimensions: Flange size, 1 1/4 inch S. A. E.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 11/16 inch I. D.
Main venturi, 1 1/4 inch I. D.

Float Setting: See adjustments.

Vents: Outside, none. Inside, balance vent to air horn above choke valve.

Gasoline Intake: Size No. 46 (.081 inch) drill in needle seat.

Low Speed Jet Tube: Jet, size No. 70 (.028 inch) drill. By-pass in air horn, size No. 55 (.052 inch) drill. Economizer in body, size No. 53 (.0595 inch) drill. Idle bleed in body, size No. 52 (.0635 inch) drill.

Idle Port: Upper port, slot type, length .200 inch; width .030 inch.

Idle Port Opening: Top of port .142 to .146 inch above top edge of valve with valve tightly closed.

Lower Port (For Idle Adjustment Screw): .0615 to .0655 inch diameter.

Set Idle Adjustment Screw: 1/2 to 1 1/2 turns open. For richer mixture turn screw out. Do not idle engine below 550 r.p.m. (Std. and Overdrive trans.); 450 r.p.m. (Hydramatic—in neutral).

Main Nozzle: Nozzle is installed permanently. DO NOT REMOVE. Anti-percolator air bleed, size No. 70 (.028 inch) drill.

Metering Rod: Economy step .078 inch diameter; middle step tapers to .07325 inch diameter; power step .047 inch diameter.

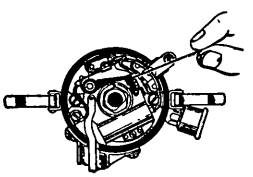
Metering Rod Jet: .102 inch diameter.

Metering Rod Setting: See adjustments.

Accelerating Pump: Diaphragm type, vacuum and mechanically operated. Discharge restriction (in housing), size No. 65 (.035 inch) diameter. Intake ball check seat (in diaphragm housing), size No. 40 (.098 inch) drill. Discharge ball check seat (in diaphragm housing), size No. 32 (.116 inch) drill. Vacuum restriction (in flange), size No. 55 (.052 inch) drill. Vacuum passage (diaphragm bleed), size No. 65 (.035 inch) drill.

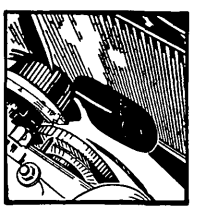
Pump Adjustment: None.

Choke: Carter Climatic® Control, set one point lean, offset butterfly type. Choke heat suction hole in body, size No. 46 (.081 inch) drill.

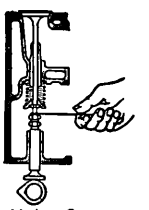


Vacuum Spark Port: Round type, size .040 inch diameter. Bottom of port .021 to .029 inch above top edge of valve with valve tightly closed.

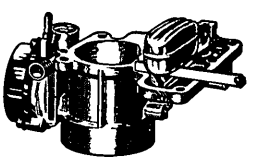
Motor Tune-Up—Be Accurate!



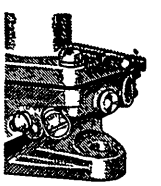
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .030"



Breaker Point Setting .020"



Ignition Timing Breaker Points to Open: 4° A. T. D. C.

Valve Setting (Hot) Intake .015" Exhaust .015"

Float Setting 1/2 Inch

Idle Adjustment Screw Setting 1/2 to 1 1/2 Turns Open

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: With gasket removed, bowl cover assembly inverted, and float resting on seated needle, the distance from the bowl cover to the top of float should be 1/2 inch (gauge T109-83). Adjust by bending lip of float, not float arm.

METERING ROD ADJUSTMENT: This adjustment is important and should be checked each time the carbureter is reassembled or lean rods are installed. With throttle valve seated in bore of carbureter, press down on upper end of diaphragm shaft until diaphragm bottoms in vacuum chamber. (Tool T109-212 may be used to hold diaphragm shaft down while adjusting metering rod.)

Metering rod should contact bottom of metering rod well, and meeting rod arm should contact lifter link between

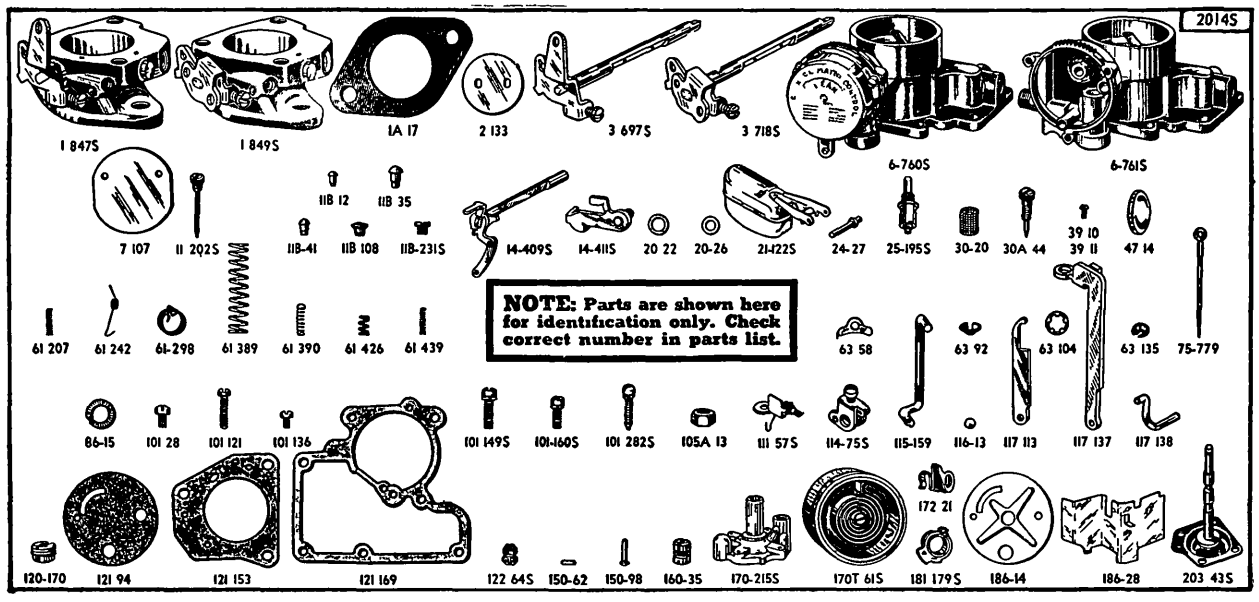
CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA



PRINTED IN U.S.A.

springs and at supporting lug Adjust by bending lip up or down

ACCELERATING PUMP If acceleration is not satisfactory remove pump housing, intake check assembly and discharge check ball and spring Examine diaphragm for wear or damage Be sure intake screen intake check and discharge check are not clogged with lint or foreign matter Discharge check ball must seat as a leak at this point will result in poor acceleration, inspect and replace all worn parts, clean and blow out all passages with compressed air

FAST IDLE ADJUSTMENT. Remove thermostatic coil housing, gasket and baffle plate Crack throttle valve, and hold choke valve fully closed, then close throttle This will allow fast idle cam to revolve to fast idle position With choke valve held tightly closed and slight tension on throttle lever, there should now be 054 inch clearance (gauge T109-193) between throttle valve and bore of carbureter (side opposite idle port) Adjust by bending connector link at lower angle Use bendnig tool T109-213

UNLOADER ADJUSTMENT This adjustment must be made after fast idle adjustment Hold throttle valve in wide open position and close choke valve as far as possible without forcing There should be 9/32 inch clearance between lower edge af choke valve and inner wall of air horn (gauge T109-126) Adjust by bending arm on choke trip lever (Use tool T109-214)

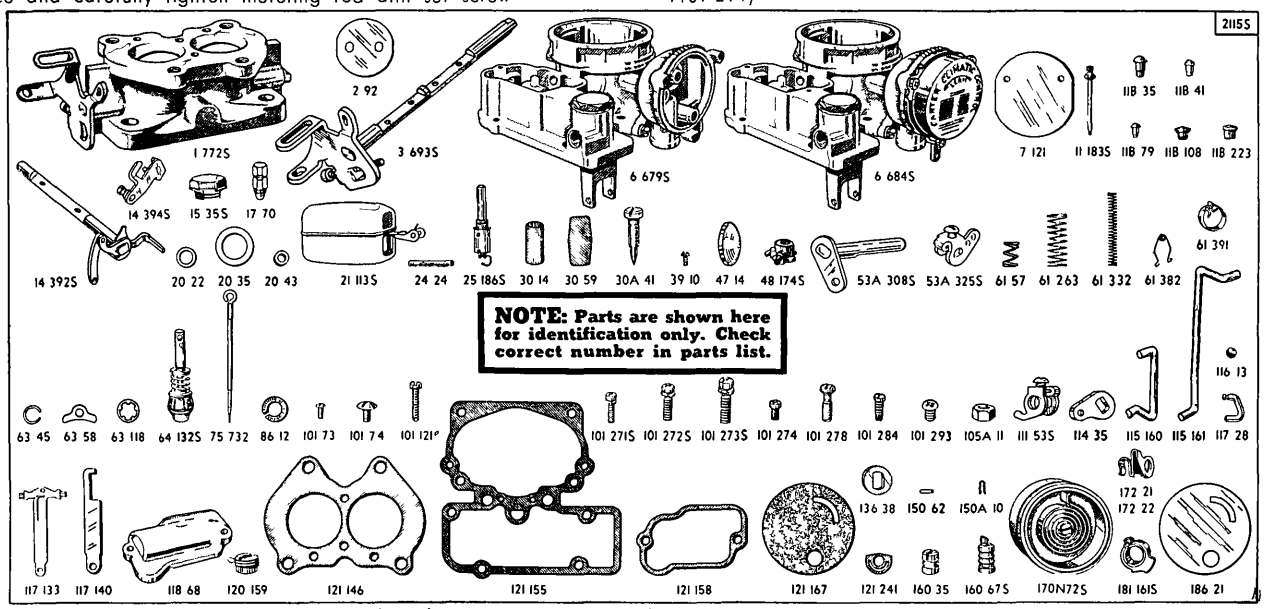
CARBURETER
TRADE MARK REG U. S PAT. OFF
MARCA REGISTRADA

S S PRINTED IN U S A



plunger shaft Number indicated on gauge should be '43 Adjust by bending throttle connector rod at upper angle

Optional Adjustment The distance from the dust cover boss to the top of the plunger shaft should be 1/2 inch Adjust as mentioned above

Metering Rod Adjustment The metering rods must be adjusted after the pump adjustment or when leaner than standard rods are installed No metering rod gauges are necessary procedure is as follows With the throttle lever set screw backed out and throttle valves seated in bores of carbureter press down on vacumeter link until metering rods bottom in casting With rods held in this position revolve metering rod arm until lip contacts vacumeter link Hold in place and carefully tighten metering rod arm set screw

Fast Idle Adjustment With the thermostatic coil housing gasket and baffle plate removed crack throttle valve and hold choke valve closed Then close throttle There should now be 026 clearance (gauge T109 189) between throttle valve and bore of carbureter (side opposite idle port) Adjust by bending the choke connector rod at lower angle

Unloader Adjustment Must be made after fast idle adjustment Hold throttle valve wide open and close choke valve as far as possible without forcing there should now be 5/32 inch (gauge T109 154) clearance between upper edge of choke valve and inner wall of air horn Adjust by bending arm on choke trip lever (tool T109 214)

(Two Carbureters Per Engine)

WA1 Down-Draft Climatic® Control **Carbureters Nos. 990S-2114S**

CARBURETER SPECIFICATIONS

For Hudson 6 Cylinder Engine (Models 5B, 5C and 5D): 3-9/16 Inch Bore, 4⅜ Inch Stroke
For Hudson 6 Cylinder Engine (Model 4C): 3-9/16 Inch Bore, 3⅞ Inch Stroke

Dimensions: Flange size, 1¼ inch S. A. E.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 11/16 inch I. D.
Main venturi, 1⅜ inch I. D.

Float Level: Distance from seam of float (at free end) to tip on lower edge of float chamber cover, when needle is seated, to be ½ inch.

Vents: Outside, No. 10 (.1935 inch) drill. Inside, none.

Gasoline Intake: Square vertical push-pull needle. Size No. 46 (.081 inch) drill hole in needle seat.

Low Speed Jet Tube: Jet, size (990S) No. 65 (.035 inch) drill; (2114S) No. 66 (.033 inch) drill. By-pass in body size No. 53 (.0595 inch) drill. Economizer, in body .0545-.0555 inch diameter. Idle bleed, in body, size No. 53 (.0595 inch) drill.

Idle Port: Length .165 inch; width .030 inch.

Idle Port Opening: .120 to .124 inch above valve with valve tightly closed.

Idle Screw Seat: No. 46 (.081 inch) drill.

Set Idle Adjustment Screw: ¾ to 1¾ turns open. For richer mixture turn screw out. Do not idle engine below 500 r.p.m. (Hydra-Matic—in Drive Range); 550 r.p.m. (Standard and Overdrive Trans.).

Main Nozzle: (Assembly) Slip nozzle, flush type, (angle, tip) seats in primary venturi, at 45° angle. Discharge jet size, .110 inch diameter. Inner nozzle (seats in slip nozzle) I. D. No. 31 (.120 inch) drill.

Metering Rod (Vacumeter Type): Economy step (990S) .075 inch; (2114S) .0745 inch diameter. Middle step tapers to (990S) .059 inch; (2114S) .066 inch diameter.
Power step (990S) .055 inch; (2114S) .059 inch diameter.

Metering Rod Jet: .1015 inch diameter.

Metering Rod Setting: Use gauge, part No. T109-102 (2.468 inches).

Accelerating Pump: Pressure type (spring operated lever) with adjustable stroke.
Discharge jet, Size No. 74 (.0225 inch) drill. Intake ball check seat, size No. 60 (.040 inch) drill. Discharge ball check seat, size No. 32 (.116 inch) drill. Relief passage (to outside), size No. 42 (.0935 inch) drill.

Pump Adjustment: See Adjustments.

Choke: Carter Climatic® Control, set 1 point lean—butterfly type, offset valve. Choke Heat Suction Hole, in body, size No. 40 (.098 inch) drill.

Vacuum Spark Port: .051-.054 inch diameter. Top of port .040 inch above top edge of valve.

MOTOR TUNE-UP

Spark Plug Gap	Breaker Point Setting	Ignition Timing Breaker Points to Open:	Valve Setting (Hot)	Float Setting	Idle Adjustment Screw Setting
.032"	.020"	T. D. C.	Intake .010" / Exhaust .012" } 1952-53 Intake .008" / Exhaust .010" } 1954	½ Inch (Use Gauge T109-83)	¾ to 1¾ Turns Open

CARBURETER ADJUSTMENTS

PUMP ADJUSTMENT: With throttle valve seated, and connector link in lower hole (medium stroke), pump plunger should travel 16/64" from closed to wide open throttle position. Measure pump travel by using Universal pump travel gauge T109-117S. Place base of the gauge on ridged portion of bowl cover so that projecting portion of pump gauge rests on top surface of connector link at pump shaft. Hold gauge vertical. The difference between the numbers shown by index mark on gauge, at wide open and closed throttle position should be "16" (16/64"). Adjust by bending throttle connector rod at lower angle.

METERING ROD ADJUSTMENT: Correct setting of metering rod is important and must be made after pump adjustment or when leaner than standard rods are installed. Insert gauge (tool T109-102) in place of metering rod, seating tapered end of gauge in metering rod jet. Hold gauge vertical to insure seating in jet. With throttle valve seated, press down on piston link directly over piston until it contacts the pump arm. There should now be less than .005" clearance between metering rod pin and shoulder in notch of gauge. Gauge must not drag on pin. Adjust by bending lip on piston link (use tool T109-105). Remove gauge and install metering rod, disc, pin and spring.

ANTI-PERCOLATOR ADJUSTMENT: Crack throttle valve .020" by placing gauge T109-29 between throttle valve and bore of carbureter (side opposite idle port). Bend rocker arm (use tool T109-105) until there is a clearance of .005" to .015" between rocker arm lip and pump arm.

FAST IDLE ADJUSTMENT: With fast idle cam in normal idle position, tighten throttle lever adjusting screw until it just seats against cam. Hold throttle lever closed and pull cam back until first (or lower) step is against (not on) set screw. There should now be ½" clearance (gauge T109-83) between inside wall of air horn and lower edge of choke valve. Adjust by bending fast idle link at offset portion (use tool T109-41).

UNLOADER ADJUSTMENT: With throttle valve wide open there should be 9/16" clearance (gauge T109-84) between lower edge of choke valve and inner wall of air horn. Adjust by bending cam on throttle lever (use tool T109-41)

WA1 Down-Draft Climatic® Control Carbureter—**Model 749S**

CARBURETER SPECIFICATIONS

For Hudson 6 Cylinder Engine 3 9/16 Inch Bore 3⅞ Inch Stroke

Dimensions Flange size 1½ inch S A E
Primary venturi 11/32 inch I D
Secondary venturi 11/16 inch I D
Main venturi 1⅜ inch I D

Float Level Distance from seam of float (at free end) to tip on lower edge of float chamber cover when needle is seated to be ½ inch

Vents Outside No 10 drill Inside none

Gasoline Intake Square vertical needle Size No 46 (.081") drill hole in needle seat

Low Speed Jet Tube Jet size No 65 drill By pass size 1.6 mm drill Economizer in body .0545 .0555 inch diameter Idle bleed size No 52 drill

Idle Port Length .190 inch width .040 inch

Idle Port Opening .136 to .140 inch above valve with valve closed tight

Idle Screw Seat No 46 drill

Set Idle Adjustment Screw ½ to 1½ turns open For richer mixture turn screw out Do not idle engine below 500 r p m (Hydra Matic—In Drive Range) 550 r p m (Standard and Overdrive Trans.)

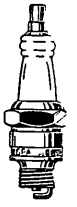
Main Nozzle (Assembly) Slip nozzle flush type (angle tip) seats in primary venturi at 45° angle Discharge jet size .110 inch diameter Inner nozzle (seats in slip nozzle) I D No 31 (.120") drill

Metering Rod (Vacumeter Type) Economy step .0745 inch diameter middle step tapers to .066 inch power step .040 inch diameter
Length 3 9/64 inches

Metering Rod Jet .1015 inch diameter

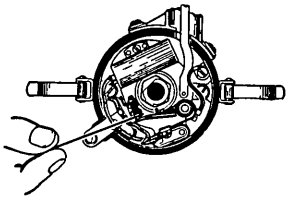
Metering Rod Setting Use gauge part No T109 102 (2.468 inches)

Accelerating Pump Pressure type with adjustable stroke Discharge jet size No 72 drill Intake ball check size No 60 drill Discharge ball check size No 32 drill Relief passage (to outside) size No 42 drill



Pump Adjustment 16/64 inch plunger travel (full throttle position) medium stroke Use gauge No T109 117S

Choke Carter Climatic® Control set at index Butterfly type offset valve Choke Heat Suction Hole in body size No 30 drill



Vacuum Spark Port .054 .057 inch diameter Bottom of port .020 inch above valve

Motor Tune-Up—Be Accurate!

CARBURETER ADJUSTMENTS

PUMP ADJUSTMENT With throttle valve seated and connector link in lower hole (medium stroke) pump plunger should travel 16/64 from closed to wide open throttle position
Measure pump travel by using Universal pump travel gauge T109 117S Place base of the gauge on ridged portion of bowl cover so that projecting portion of pump gauge rests on top surface of connector link at pump shaft Hold gauge vertical The difference between the numbers shown by index mark on gauge at wide open and closed throttle position should be .16 (16/64")
Adjust by bending throttle connector rod at lower angle

METERING ROD ADJUSTMENT Correct setting of metering rod is important and must be made after pump adjustment or when leaner than standard rods are installed

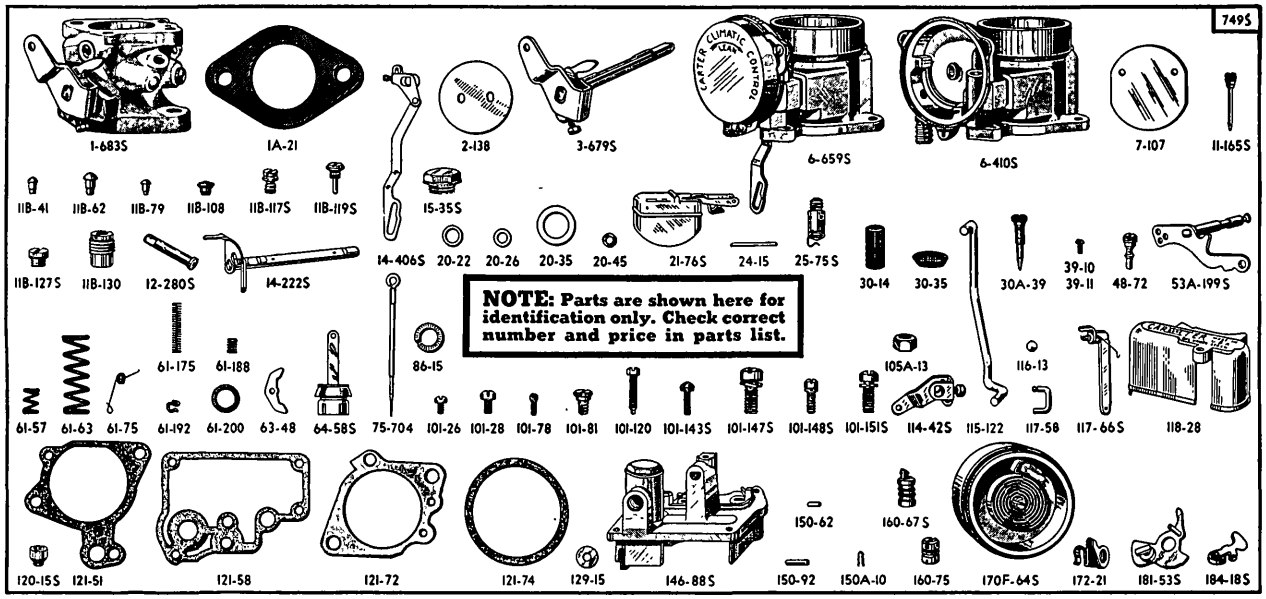
CARBURETER
TRADE MARK REG U S PAT OFF
MARCA REGISTRADA

PRINTED IN U.S.A.



Insert gauge (tool No. T109-102) in place of metering rod, seating tapered end of gauge in metering rod jet. Hold gauge vertical to insure seating in jet. With throttle valve seated, press down on piston link, directly over piston until it contacts the pump arm. There should now be less than .005" clearance between metering rod pin and shoulder in notch of gauge. Gauge must not drag on pin.
Adjust by bending lip on piston link (use tool T109-105) Remove gauge and install metering rod, disc, pin and spring.

ANTI-PERCOLATOR ADJUSTMENT: Crack throttle valve .020" by placing gauge T109-29 between throttle valve and bore of carbureter (side opposite idle port). Bend rocker arm (use tool T109-105) until there is a clearance of .005" to .015" between rocker arm lip and pump arm.

FAST IDLE ADJUSTMENT: With fast idle cam in normal idle position, tighten throttle lever adjusting screw until it just seats against cam. Hold throttle lever closed and pull cam back until first (or lower) step is against (not on) set screw.

There should now be 5/8" clearance between inside wall of air horn and lower edge of choke valve. (Use tool T109-85.) Adjust by bending fast idle link at offset portion (use tool T109-41)

UNLOADER ADJUSTMENT: With throttle valve wide open there should be 7/16" clearance between lower edge of choke valve and inner wall of air horn (T109-80). Adjust by bending cam on throttle lever (T109-41).

Hudson 6—1950-1954—No. 749S

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT (Fig. 1)

With bowl cover gasket removed, bowl cover inverted and needle seated, there should be 3/16 inch (gauge T109-28) between top of float and bowl cover Adjust by bending float arm

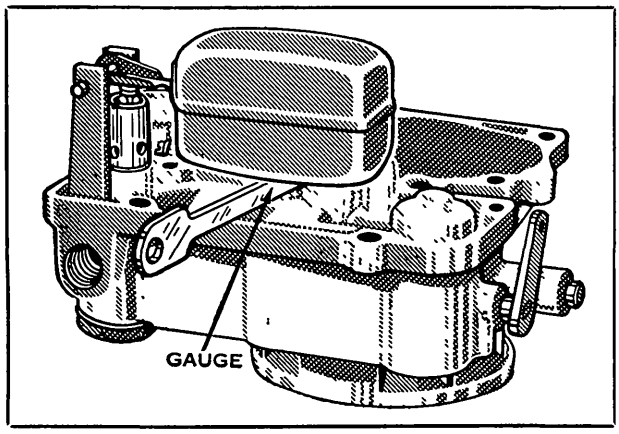

Figure 1
Float Adjustment

PUMP ADJUSTMENT (Fig. 2):

Back out throttle lever set screw until throttle valves seat in bores of carbureter. Place Universal pump travel gauge T109-117S inverted on edge of dust cover boss of bowl cover Turn knurled nut of gauge until finger on gauge just touches top of plunger shaft (A). Number indicated on gauge should be "43" Adjust by bending throttle connector rod at upper angle (B).

Optional Adjustment The distance from the dust cover boss to the top of the plunger shaft should be 1/2 inch (C) Adjust as mentioned above

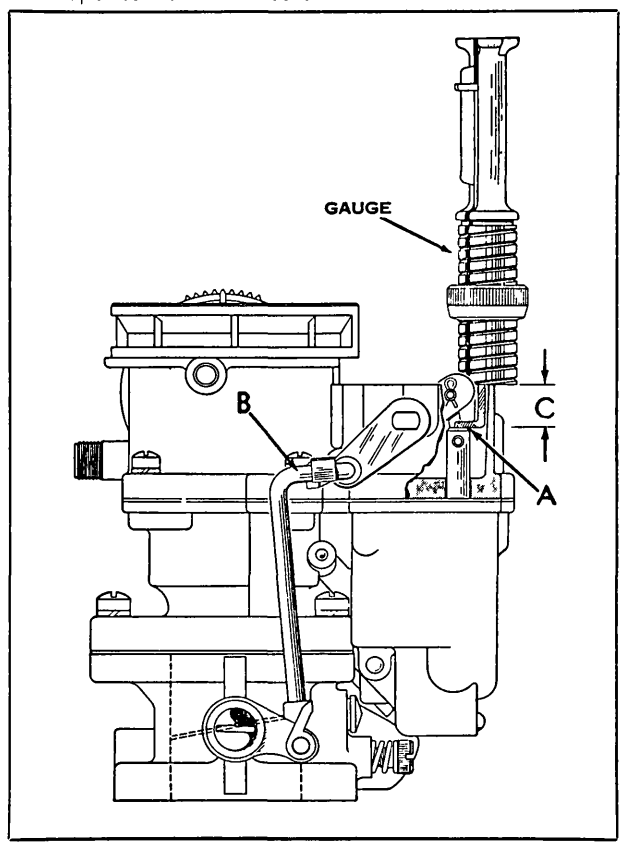

Figure 2
Pump Adjustment

METERING ROD ADJUSTMENT (Fig. 3):

The metering rods must be adjusted after the pump adjustment or when leaner than standard rods are installed No metering rod gauges are necessary, procedure is as follows With the throttle lever set screw backed out and throttle valves seated in bores of carbureter, press down on vacumeter link (D) until metering rods bottom in casting at (E) With rods held in this position, revolve metering rod arm (F) until lip contacts vacumeter link at (G) Hold in place and carefully tighten metering rod arm set screw (H)

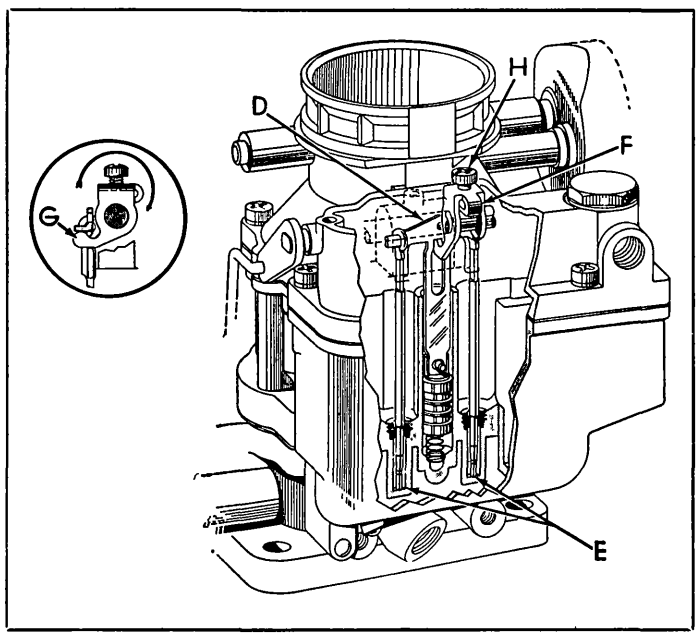

Figure 3
Metering Rod Adjustment

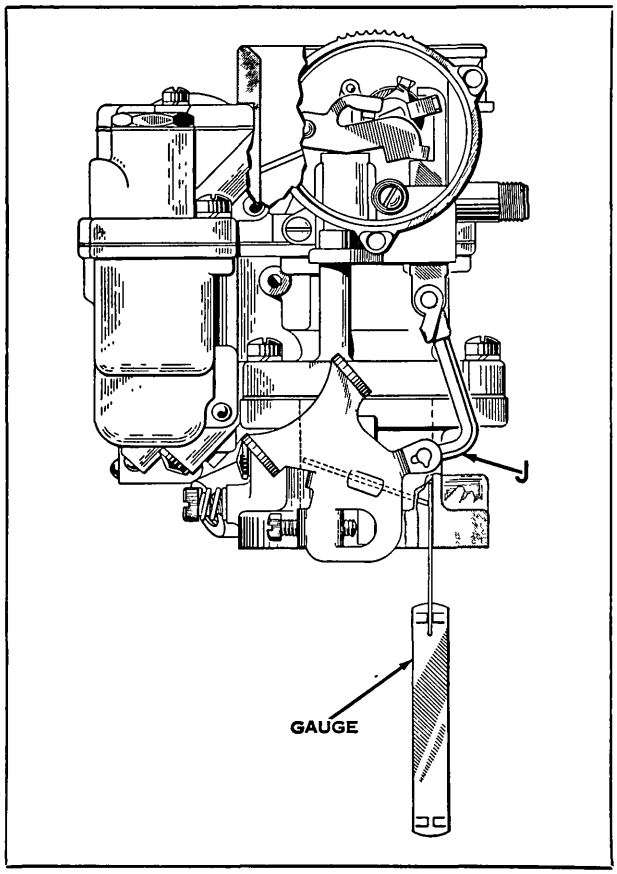

Figure 4
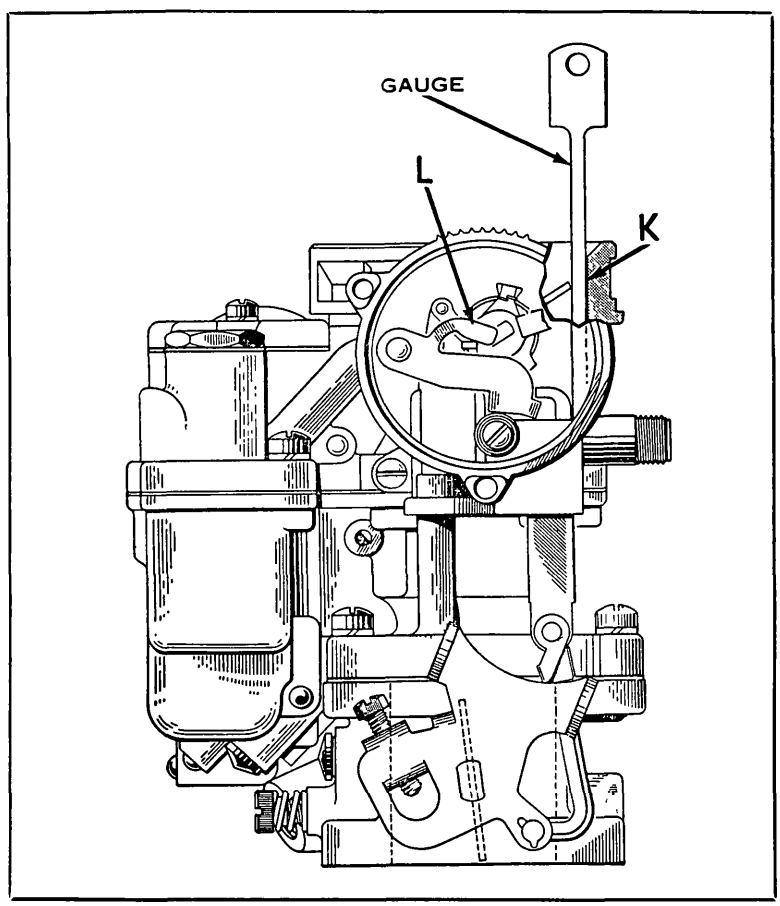
Fast Idle Adjustment

FAST IDLE ADJUSTMENT (Fig. 4):

With the thermostatic coil housing gasket and baffle plate removed, crack throttle valve and hold choke valve closed. Then close throttle. There should now be .026" clearance (gauge T109-189) between throttle valve and bore of carbureter (side opposite idle port). Adjust by bending the choke connector rod at lower angle (J).

UNLOADER ADJUSTMENT (Fig. 5):

Must be made after fast idle adjustment. Hold throttle valve wide open and close choke valve as far as possible without forcing; there should now be 5/32 inch (gauge T109-154) clearance between upper edge of choke valve and inner wall of air horn (K). Adjust by bending arm on choke trip lever (L) (tool T109-187).



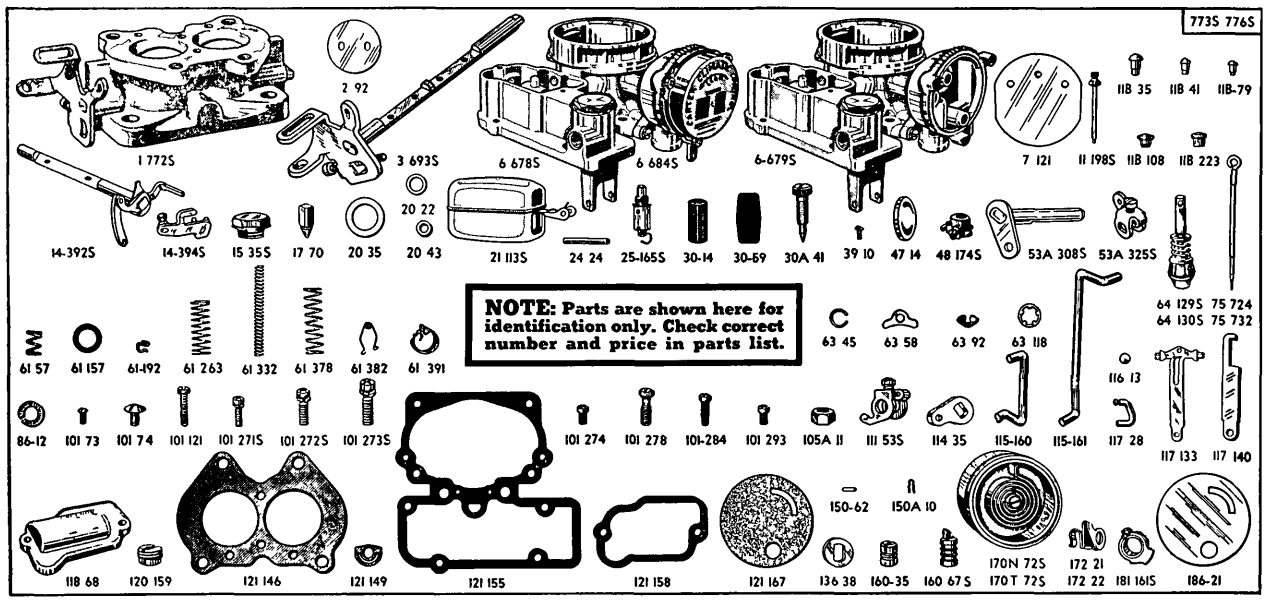


Figure 5
Unloader Adjustment

Casting No. 542 on face of flange.

WDO Dual Down-Draft Climatic® Cont. Carbs. **Nos. 647S-647SA** (6), **648S** (8)

CARBURETER SPECIFICATIONS

For Hudson 647S-647SA Six Cyl. Engine 3-9/16" Bore, 4⅜" Stroke. For Hudson 648S Eight Cyl. Engine 3" Bore, 4½" Stroke

Dimensions: 1¼ inch dual, 4 bolt flange.
Primary venturi, 11/32 inch I. D
Secondary venturi, 19/32 inch I. D.
Main venturi, 1-3/16 inch I. D.

Float Level: Distance from float to bowl cover, when needle is seated, to be 3/16 inch (647S-647SA), 13/64 inch (648S)

Vents: Outside, No. 10 drill size—four holes. Inside, none

Gasoline Intake: Square vertical needle. Size No. 38 drill hole in needle seat.

Low Speed Jet Tube: (647S-647SA) Jet size, No. 67 drill.
(648S) Jet size, No 68 drill.
(647S) By-pass (plug, 11B-167), size No. 51 drill
(647SA) By-pass (plug, 11B-159), size No. 52 drill.
(648S) By-pass (plug), size No. 54 drill.
Economizer in body, size No. 56 drill.
Idle bleed, size No. 54 drill (early production); No. 56 drill (late production).

Idle Ports: Length, .200 inch; width, .030 inch.

Idle Port Opening: 157 to .163 inch above upper edge of valve with valve closed tight.

Lower Port (For Idle Adjustment Screw): Size, .0615 to 0655 inch diameter.

Set Idle Adjustment Screw: (647S-647SA) 1¼ to 1¾, (648S) 1 to 1½ turns open For richer mixture, turn screw out Do not attempt to idle engine below 550 r p.m. or 8 m p h

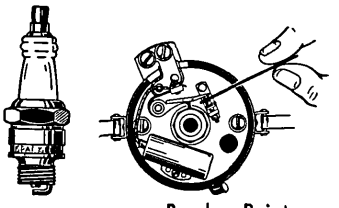
Main Nozzle: (647S-647SA) In primary venturi, angle 45°.
Closed tip. Inside diameter No 30 drill.
Upper hole. .028 inch dia. drill on 45° angle.
Lower hole: .0635 inch dia. drill on 60° angle.
(648S) Flush type (angle tip) seats in primary venturi
Discharge, size .0635 inch diameter (early production), size 061 inch (later production)

Metering Rod (Vacumeter Type): (647S-647SA) Economy step, 061 inch diameter, middle step tapers to 0565 inch diameter, power step, .048 inch diameter. Length 2-59/64 inches
(648S) Economy step, .068 inch diameter, middle step tapers to 063 inch diameter, power step, .055 inch diameter (early production), .052 inch diameter (late production) Length 2-59/64 inches.

Metering Rod Jet: .086 inch diameter.

Metering Rod Setting: Use gauge, part No. T109-113 (2 280 inches)

Accelerating Pump: High pressure type (spring operated lever), with adjustable pump stroke
Discharge jets (twin) size, No 74 drill.
Intake ball check, size No 40 drill
Discharge (needle seat), size No. 50 drill
Relief passage (to outside), thru slots in air horn



Pump Adjustment. (647S-647SA) 18/64" (648S) 14/64" plunger travel (full throttle position) long stroke. Use gauge No T109-117S

Choke Carter Climatic® Control, (647S-647SA) set 1 point lean, (648S) set on index Butterfly type, offset valve
Choke heat suction hole (in body), size No. 34 (.111 inch) drill

Vacuum Spark Port: 039 to .041 inch diameter. Top of port 012 to 022 inch above valve.

Motor Tune-Up—Be Accurate! Always Use Feeler Gauges!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

PUMP ADJUSTMENT: With pump connector link in long stroke (outer hole in pump arm), and throttle adjusting screw backed out, pump plunger should travel 18/64" (647S-647SA), 14/64" (648S) from closed to wide open throttle positions Pump travel should be measured by placing gauge T109-117S on raised portion of bowl cover around the plunger shaft Projecting portion of indicator should be placed on top surface of connector link where it extends through the plunger shaft. The difference between reading at wide open and closed throttle positions should be "18" (647S-647SA), "14" (648S). Adjust by bending throttle connector rod at lower angle

METERING ROD ADJUSTMENT: Must be made when reassembling carbureter or when leaner than standard metering rods are installed. Do not disturb pump adjustment Procedure is as follows:

(a) Back out throttle lever adjustment screw until throttle valves seat. Insert one metering rod gauge T109-113 in place of metering rod. Be sure gauge seats in metering rod jet.
(b) Install metering rod pin and pin spring in vacuum piston link assembly
(c) Press lightly on top of vacuum piston link until lip contacts tongue on anti-percolator arm. There now should be less than .005" clearance between metering rod pin and shoulder in notch of gauge with throttle valve seated.

Adjust by bending tongue on pump arm (Use Tool T109-105). Remove gauge and metering rod pin and install metering rods, discs, spring, pin and pin spring, and hook spring to metering rod Vacuum piston and link must not bind and drag in any position

ANTI-PERCOLATOR ADJUSTMENT: After adjusting pump stroke and metering rods, bend lips on anti-percolator arm so that center of indicator line on anti-percolator valves is flushed with top of anti-percolator plugs. Since there are two anti-percolators on this carbureter, care must be taken so that there is an even adjustment on both anti-percolator valves Be sure throttle valves are seated when making this adjustment

UNLOADER ADJUSTMENT: With throttle valves wide open, distance between upper edge of choke valve and inner wall of air horn should be ¼" (Gauge T109-31). Adjust by bending lip on fast idle connector link. When unloader is adjusted properly, with throttle valve wide open, move choke valve to wide open position and choke valve will lock in open position.

CARBURETER
TRADE MARK REG U S PAT OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.

FAST IDLE ADJUSTMENT With choke valve tightly closed and fast idle screw on high step of fast idle cam there should be .054" clearance between throttle valves and bores of carbureter (side opposite idle port) Adjust by turning fast idle adjusting screw (on high step of cam) until specified clearance is obtained

FLANGE ASSEMBLY Assemble in the following manner in order to center throttle valves properly and eliminate excessive endplay in the throttle shaft Install throttle shaft and lever assembly and place throttle shaft retaining ring firmly on stub of shaft with prongs extending outward Take out all endplay by pressing retaining ring on shaft as far as possible Then install throttle valves with "c" in circle toward the idle port when viewed from the manifold side To center valves tap lightly holding in place with fingers while tightening screws

Hudson—1948-1949—Nos. 647S-647SA-648S

WHEN SERVICING, USE GASKET ASST. No. 149; REPAIR PACKAGE No 1381B, FOR 647S-647SA; No. 1382A, FOR 648S

WDO Dual Down-Draft Climatic® Control Carbureters—**Models 501S-502S**

CARBURETER SPECIFICATIONS

For Hudson 501S Six Cyl. Engine: 3 Inch Bore, 5 Inch Stroke. For Hudson 502S Eight Cyl. Engine: 3 Inch Bore, 4½ Inch Stroke.

Dimensions: (502S) 1¼ inch dual, 4 bolt flange.
(501S) 1 inch dual 4 bolt flange
(Both) Primary venturi, 11/32 inch I. D.
(502S) Secondary venturi, 19/32 inch I. D.
(501S) Secondary venturi, 21/32 inch I. D
(502S) Main venturi, 1-3/16 inch I D.
(501S) Main venturi, 1-1/16 inch I. D.

Float Level: (Both) Distance from float to bowl cover, when needle is seated, to be ⅛ inch

Vents: (Both) Outside, No. 10 drill size—four holes. Inside, none.

Gasoline Intake: (Both) Square vertical needle Size No. 38 drill hole in needle seat.

Low Speed Jet Tube: (502S) Jet size, No. 69 drill
(501S) Jet size, No. 71 drill.
(Both) By-pass (plug), size No. 51 drill
(501S) Economizer in body, size No. 56 drill (early production). Economizer in body, size No. 1.3 mm (.0512") drill (later production).
(502S) Economizer in body, size No. 56 drill.
(Both) Idle bleed, size No. 54 drill.

Idle Ports: (502S) Length, 175 inch; width, .030 inch
(501S) Length, .150 inch; width, .030 inch.

Idle Port Opening: (502S) .133 to .137 inch above upper edge of valve (early production); .129 to .135 inch above upper edge of valve (late production) with valve closed tight.
(501S) .108 to .112 inch above upper edge of valve with valve closed tight (early production).
(501S) .108 to .114 inch above upper edge of valve with valve closed tight (late production).

Lower Port (For Idle Adjustment Screw): (Both) Size, .0615 to .0655 inch diameter

Set Idle Adjustment Screw: (Both) ½ to 1½ turns open. For richer mixture, turn screw out. Do not attempt to idle engine below 600 r.p.m. or 8 m.p.h.

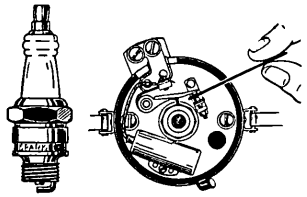
Main Nozzle: (Both) In primary venturi, angle 45°.
(Both) Closed tip. Inside diameter No. 30 drill.
(Both) Upper hole: No. 70 drill on 45° angle
(502S) Lower hole: No. 52 drill on 60° angle.
(501S) Lower hole: No. 52 drill

Metering Rod (Vacumeter Type): (502S) Economy step, .065 inch diameter (early production), .063 inch diameter (late production); middle step tapers to .0565 inch diameter power step, .044 inch diameter. Length 2-59/64 inches.
(501S) Economy step, .0615 inch diameter; middle step tapers to .057 inch diameter: power step, 047 inch diameter. Length 2-59/64 inches.

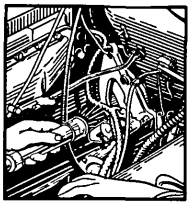
Metering Rod Jet: (502S) .086 inch diameter.
(501S) .082 inch diameter

Metering Rod Setting: (Both) Use gauge, part No. T109-113 (2.280 inches).

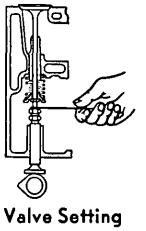
Accelerating Pump: (Both) High pressure type (spring operated lever), with adjustable pump stroke.
(Both) Discharge jets (twin) size, No. 74 drill.
(Both) Intake ball check, size No. 40 drill.
(Both) Discharge (needle seat), size No. 50 drill



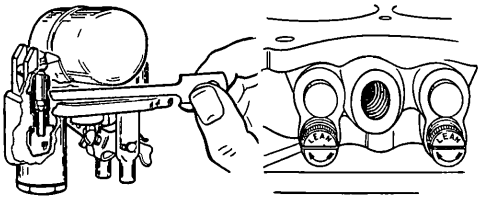
Pump Adjustment: (Both) 18/64 inch plunger travel (full throttle position) long stroke. Use gauge No T109-117S



Choke: Carter Climatic® Control, set 1 point lean. Butterfly type, offset valve.
Choke heat suction hole (in body), size No. 34 (.111 inch) drill



Vacuum Spark Port: (502S) None (501S) .039 to .041 inch diameter. Top of port .029 to .033 inch above valve (early production). Top of port .030 to .040 inch above valve (late production).



Motor Tune-Up—Be Accurate! Always Use Feeler Gauges!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter

Spark Plug Gap .032"

Breaker Point Setting 6 Cyl.—.020" 8 Cyl.—.017"

Ignition Timing Breaker Points to Open 8 Cyl.—T.D.C. 6 Cyl.—½" B.T.D.C.

Valve Setting
1941-42 Intake .006" Exhaust .008"
1946-47 Intake .010" (6 cyl.) .006" (8 cyl.) Exhaust .012" (6 cyl.) .008" (8 cyl.)

Float Setting ⅛ Inch

Idle Adjustment Screw Setting ½ to 1½ Turns Open

BRIEF CARBURETER ADJUSTMENTS

PUMP ADJUSTMENT: Back out throttle lever adjustment screw until throttle valves seat in bores of carbureter. With pump connector link in outer hole (long stroke) pump plunger should travel 18/64 inch from closed to wide open throttle position Pump stroke can be measured by placing Universal pump stroke gauge T109-117S on raised portion of bowl cover with projecting lip of gauge resting on top surface on connector link where it extends through the plunger shaft. The difference in readings at closed and wide open throttle positions should be "18" (18/64" plunger travel). Adjustment may be made by bending throttle connector rod at lower angle.

METERING ROD ADJUSTMENT: The metering rod adjustment should be made after the pump adjustment and before the anti-percolator adjustment. Back out throttle adjustment screw until throttle valves seat in bore of carbureter. Remove metering rod and metering rod disk. Insert in their place one metering rod gauge T109-113. Be sure gauge seats in metering rod jet Reinstall metering rod pin and pin spring in metering rod arm. Then press lightly on vacuum piston link until pin contacts metering rod gauge. With throttle valve seated bend metering rod lip on anti-percolator arm until there is a clearance of .005" between pin and notch in metering rod gauge Remove pin and metering rod gauge and install metering rods, disks, spring, pin and pin spring and hook metering rod spring on metering rod.

ANTI-PERCOLATOR ADJUSTMENT: This adjustment must be made after pump and metering rod adjustments have been made Do not disturb these adjustments Back out

tnrottle lever adjusting screw so that throttle valves seat in bores of carbureter With throttle valves seated bend lips on anti-percolator arm so that center of indicator line is flush with top of anti-percolator plugs Since there are two anti-percolators on this carbureter, care must be taken so that there is an even adjustment on both anti-percolator valves

UNLOADER ADJUSTMENT: With throttle wide open distance between upper edge of choke valve and inner wall of air horn should be ¼" Adjustment can be made by bending lip on fast idle connector link If unloader is adjusted properly, with throttle wide open, move choke valve wide open and choke valve will be locked in wide open position Closing the throttle will release choke valve Choke trip lever is notched out for this setting

FAST IDLE ADJUSTMENT: With choke valve tightly closed and fast idle screw on upper step of fast idle cam, adjust screw to give 045" opening on 501S, 053" on 502S, between edge of throttle valve and bore of carbureter side opposite port

Hudson—1941-1942-1946-1947—Nos. 501S-502S

WHEN SERVICING, USE GASKET ASSORTMENT No 149, REPAIR PACKAGE No. 1302A FOR 501S, No 1303A FOR 502S

OIL PRESSURE WARNING SWITCH

HUDSON 6 — 1948-1953

A815S Oil Pressure Warning Switch

(Can be used in place of A658S)

With ignition switch on and engine stopped, or before oil pressure reaches normal, the A815S Oil Pressure Warning Switch is closed and grounded completing the circuit to warning light on dash. When the oil pressure reaches normal operating pressure (11 to 15 lbs.) the switch operates as follows: The diaphragm, which is actuated by oil pressure, separates the contact points and the circuit is broken, extinguishing warning light. No adjustment of the switch is necessary as the calibration is set and sealed at the factory.

To insure efficient operation and long life, the Carter Oil Pressure Switch is equipped with silver contact points which are protected against moisture and corrosion.

UT UPDRAFT **CARBURETER No. 2338S**

CARBURETER SPECIFICATIONS

For 4 Cylinder Engine: 3⅛ Inch Bore, 4 Inch Stroke

Dimensions: Flange size, 1 inch S.A.E. Throttle bore, 1-1/16 inch. Main venturi, 23/32 inch.

Float Setting: Top of float 17/64 inch plus or minus 1/64 inch below top surface of upper body casting with casting inverted.

Vents: Outside, none. Inside, balance vent.

Gasoline Intake Needle: Size No. 48 (.076 inch) drill in needle seat.

Low Speed Jet Tube: Jet Size, No. 66 (.033 inch) drill. Upper bleed. No. 65 (.035 inch) drill. Lower bleed: No. 60 (.040 inch) drill. Economizer: No. 61 (.039 inch) drill.

Idle Ports: Lower port, slot type, round end, .049 to .051 inch by .029 to .031 inch wide. Bottom of port .044 to .048 inch below lower edge of valve. Upper port .038 to .042 inch diameter (for idle adjustment screw).

Set Idle Adjustment Screw: ½ to 1 turn open. For richer mixture, turn screw out. Do not idle engine below 425 R.P.M.

Main Metering Jet: Calibrated to flow 129 cc per minute. (Do not gauge for size. If in doubt, replace with new part.)

Nozzle: Inside diameter No. 42 (.0935 inch) drill. Accelerating Jets: 4 No. 64 (.036 inch) drill.

Air Bleed to Nozzle: (Thru plug) No. 70 (.028 inch) drill.

Choke: Manual—Butterfly type, with pressure relief (poppet) valve.

Vacuum Spark: None.

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .030"	Breaker Point Setting .020"	Valve Setting (Hot) Intake .014" Exhaust .014"	Float Setting 17/64" Plus or Minus 1/64"	Idle Adjustment Screw Setting ½ to 1 Turn Open Idle Engine at 425 R.P.M.

CARBURETER ADJUSTMENTS

To secure a good idle: Set throttle lever adjusting screw until motor runs approximately 425 r.p.m. Then set idle adjustment screw for highest steady vacuum gauge reading or smoothest engine operation. Correct setting will be found between ½ to 1 turn open.

If motor loads—check float level: Wear on lip of float lever will raise float level, causing carbureter to load up. To lower float level bend float lever toward needle. To raise float level, bend lip away from needle. A very slight bend is sufficient. Bend lip of float only, not bracket. Be sure float is installed with lip of float against needle.

Maximum performance can be secured only when breaker points, spark plugs, valves and motor timing are set to manufacturer's specifications.

If carbureter does not respond to the above adjustments, disassemble, clean all parts in carbureter cleaner, rinse and blow out all passages with compressed air. Replace all worn or damaged parts. Always use new gaskets. See form No. 3525 for complete overhaul procedure.

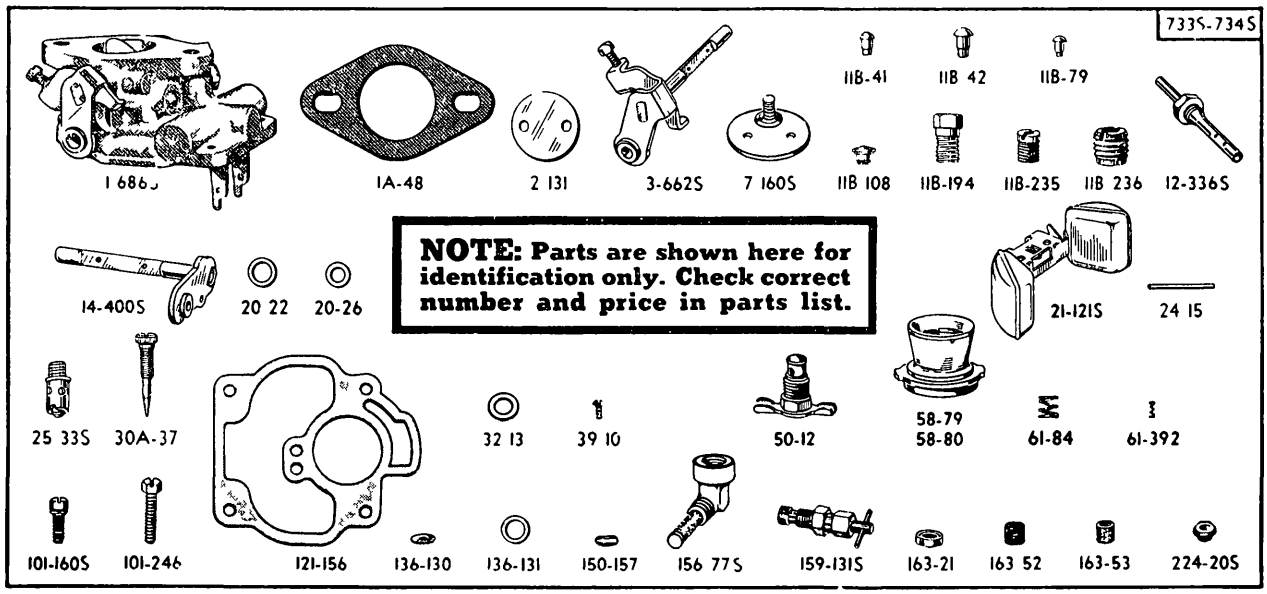
CARBURETER ADJUSTMENTS



To secure a good idle Set throttle lever adjusting screw until motor runs approximately 450 r p m Then set idle adjustment screw for highest steady vacuum gauge reading or smoothest engine operation Correct setting will be found between ½ to 1½ turns open

High Speed adjustment (734S) With hand throttle wide open and engine operating at 1650 r p m (maximum governed speed) adjust high speed adjusting needle until smoothest engine operation is obtained This setting will be found between 1¾ to 2¾ turns open

If motor loads—check float level· Wear on lip of float lever will raise float level causing carbureter to load up To lower float level bend float lever toward needle To raise float level, bend lip away from needle A very slight bend is sufficient Bend lip of float only, not bracket Be sure float is installed with lip of float against needle

Maximum performance can be secured only when breaker points, spark plugs, valves and motor timing are set to manufacturer's specifications

If carbureter does not respond to the above adjustments disassemble, clean all parts in carbureter cleaner rinse and blow out all passages with compressed air Replace all worn or damaged parts Always use new gaskets See form No 3525 for complete overhaul procedure

CARBURETER ADJUSTMENTS

To secure a good idle Set throttle lever adjusting screw until motor runs approximately 425 r p m Then set idle adjustment screw for highest steady vacuum gauge reading or smoothest engine operation Correct setting will be found between ½ to 1 turn open

High Speed Adjustment With hand throttle wide open and engine operating at 1650 r p m (maximum governed speed) adjust high speed adjusting needle until smoothest engine op eration is obtained This setting will be found between 2 to 3 turns open

If motor loads—check float level Wear on lip of float lever will raise float level causing carbureter to load up To lower float level bend float lever toward needle To raise float level bend lip away from needle A very slight bend is sufficient Bend lip of float only not bracket Be sure float is installed with lip of float against needle

Maximum performance can be secured only when breaker points spark plugs valves and motor timing are set to manu facturer s specifications If carbureter does not respond to the above adjustments disassemble clean all parts in carbureter cleaner rinse and blow out all passages with compressed air Replace all worn or damaged parts Always use new gaskets See Form No 3525 for complete overhaul procedure

MODEL SUPER C

INTERNATIONAL HARVESTER FARMALL TRACTOR 1951-1954

UT Updraft **Carbureters Nos. 771S-771SA-771SB** (Gasoline, Regular)

CARBURETER SPECIFICATIONS

For International Harvester 4 Cylinder Engine: 3 1/8 Inch Bore, 4 Inch Stroke

Dimensions: Flange size, 1 inch S. A. E.
Throttle bore. 1-1/16 inch. (26.99 mm)
Main venturi, 23/32 inch. (18.25 mm)

Float Setting: Top of float 17/64 inch (6.74 mm) plus or minus 1/64 inch (.40 mm) below top surface of upper body casting with casting inverted. (See illustration)

Vents: Outside, none. Inside, balance vent No. 12 drill (4.80 mm).

Gasoline Intake Needle: Size No. 48 (1.93 mm) drill in needle seat.

Low Speed Jet Tube: Jet size, No. 66 (.84 mm) drill.
Upper bleed: No. 65 (.89 mm) drill.
Lower bleed: No. 60 (1.02 mm) drill.
Economizer: No. 61 (.99 mm) drill.

Idle Ports: Lower port, slot type, round end, .049 to .051 inch (1.25 to 1.30 mm) by .029 to .031 inch (.74 to .79 mm) wide. Bottom of port .044 to .048 inch (1.12 to 1.22 mm) below lower edge of valve.
Upper port .038 to .042 inch (.97 to 1.07 mm) diameter (for idle adjustment screw).

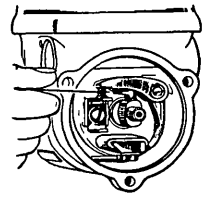
Set Idle Adjustment Screw: 1/2 to 1 turn open. For richer mixture, turn screw out. Do not idle engine below 400 R.P.M.

Main Metering Jet: Calibrated to flow 157 to 159 cc per minute (771S); 127 to 131 cc per minute (771SA).
(Do not gauge for size. If in doubt, replace with new part.)

Nozzle: Inside diameter No. 36 (2.70 mm) drill (771S); No. 42 (2.37 mm) drill (771SA).
Accelerating Jets: 2 No. 64 (.91 mm) drill 21/64 inch (8.33 mm) from shoulder. 2 No. 64 (.91 mm) drill 27/32 inch (21.44 mm) from shoulder.

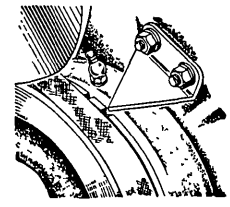
Air Bleed to Nozzle: (Thru plug) No. 70 (.71 mm) drill.

Choke: Manual—Butterfly type, with pressure relief (poppet) valve.

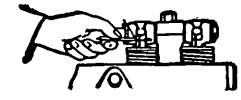


Vacuum Spark: None.

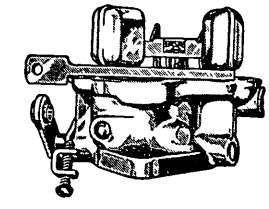
Motor Tune-Up—Be Accurate!



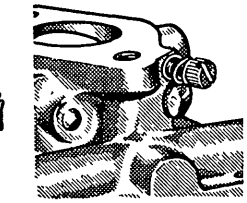
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .025"



Breaker Point Setting Battery Ign. .020"



Ignition Timing Breaker Points to Open: T. D. C.

Valve Setting Hot
Intake .014"
Exhaust .014"

CARTER CARBURETOR CORPORATION, ST. LOUIS, MO., U. S. A.

MODEL U-2A

INTERNATIONAL HARVESTER INDUSTRIAL 1950-1954

UT UPDRAFT **CARBURETER No. 795S**

CARBURETER SPECIFICATIONS

For International Harvester 4 Cylinder Engine: 3 Inch Bore, 4 Inch Stroke

Dimensions: Flange size, 1 inch S. A. E.
Throttle bore, 1-1/16 inch.
Main venturi, 19/32 inch.

Float Setting: With body gasket removed and free weight of float resting on needle, there should be 17/64 inch (plus or minus 1/64 inch) clearance between seam of float (both sides) and machined surface of casting.

Vents: Outside, none. Inside, balance vent No. 12 drill.

Gasoline Intake Needle: Square vertical needle. Size No. 48 drill in needle seat.

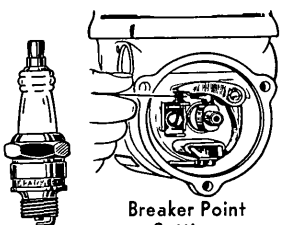
Low Speed Jet Tube: Jet size, No. 66 (.033 inch) drill.
Idle bleed, (upper) No. 65 (.035 inch) drill.
Idle bleed, (lower) No. 60 (.040 inch) drill.
Economizer, No. 61 (.039 inch) drill.

Idle Ports: Lower port, slot type, round end, .049 to .051 inch by .029 to .031 inch wide. Bottom of port .044 to .048 inch below lower edge of valve. Upper port .038 to .042 inch diameter (for idle adjustment screw).

Set Idle Adjustment Screw: 1/2 to 1 turn open. For richer mixture, turn screw out. Do not idle engine below 400 r.p.m.

Main Metering Jet: Calibrated to flow 95 to 99 cc per minute. (Do not gauge for size; if in doubt, replace with new part.)

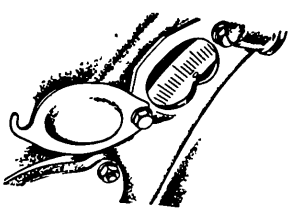
Nozzle: In primary venturi, angle 24° from vertical. Inside diameter No. 36 (.1065 inch) drill.
Accelerating Jets: 2 No. 64 (.036 inch) drill, 21/64 inch from shoulder. 2 No. 64 (.036 inch) drill, 27/32 inch from shoulder.



Air Bleed to Nozzle: (Thru plug) No. 57 (.043 inch) drill.

Choke: Manual—butterfly type, with poppet valve.

Vacuum Spark Port: None.



Motor Tune-Up—Be Accurate! Always Use Feeler Gauges!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT With bowl cover assembly inverted and float resting on pin in seated needle, and with gasket removed the distance from the bowl cover to the top of float should be 3/8 inch (gauge T109-80) Do not depress float lip against spring in needle but let float rest of its own weight Adjust by bending lip of float, not float arm

FLOAT DROP With bowl cover assembly held in upright position the distance between free end of float and bowl cover should be 1 3/16 inch Adjust by bending stop tabs on float arm

METERING ROD ADJUSTMENT This adjustment is important and should be checked each time the carbureter is

reassembled With throttle valve seated in bore of carbureter, press down on upper end of diaphragm shaft until diaphragm bottoms in vacuum chamber (Tool T109-212 may be used to hold diaphragm shaft down while adjusting metering rod) Metering rod should contact bottom of metering rod well, and metering rod arm should contact lifter link between spring and at supporting lug Adjust by bending lip up or down

ACCELERATING PUMP: If acceleration is not satisfactory remove pump check retainer ring and pump discharge ball check Then remove pump diaphragm assembly Check diaphragm for wear or damage Be sure inlet hole is not clogged with lint or foreign matter Inspect and replace all worn or damaged parts Clean and blow out all passages with compressed air Make sure discharge check seats in casting as a leak at this point will result in poor acceleration

FAST IDLE ADJUSTMENT With choke held in wide open position lip on fast idle arm should contact boss on body casting Adjust by bending at offset of fast idle link

Gasoline Intake: (740S-SA-SB) size No. 48 (1.93 mm) drill, (741S-SA-SB) size No. 46 (2.06 mm) drill, hole in needle seat. (741SA-SB) spring loaded needle.

Low Speed Jet Tube: Jet size: (740S-SA-SB) No. 70 (.71 mm) drill; (741S-SA-SB) No. 67 (.81 mm) drill. By-pass in air horn: (740S-SA-SB) No. 53 (1.51 mm) drill; (741S-SA-SB) No. 54 (1.40 mm) drill. Idle bleed in body: (740S-SA-SB) No. 53 (1.51 mm) drill; (741S-SA-SB) No. 54 (1.40 mm) drill. Economizer in body: No. 54 (1.40 mm) drill.

Idle Ports: Upper port: slot type, length (740S-SA-SB) .105 inch (2.67 mm). (741S-SA-SB) .120 inch (3.05 mm); width .030 inch (.76 mm). Lower port (for idle adjusting screw): size .0615 to .0655 inch (1.56 to 1.66 mm) diameter.

Idle Port Opening: Top of port: (740S-SA-SB) .076 to .080 inch (1.93 to 2.03 mm), (741S-741SA and 741SB early production) .109 to .113 inch (2.77 to 2.87 mm), (741SB late production) .105 to .109 inch (2.67 to 2.77 mm) above top edge of valve with valve tightly closed.

Set Idle Adjustment Screw: ¾ to 1¾ turns open. For richer mixture turn screw out. Do not idle engine below 400 RPM.

High Speed Adjustment Needle: Seat size, (740S-SA-SB) No. 50 (1.78 mm) drill, (741S-SA-SB) No. 53 (1.51 mm) drill. Adjustment, ¾ to 1¾ turns open.

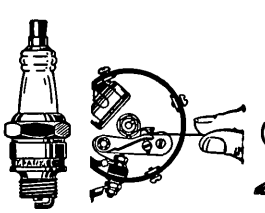
Main Nozzle: Nozzle is installed permanently. **DO NOT REMOVE.** Anti-percolator air bleed No. 66 (.84 mm) drill hole in plug.

Metering Rod: (740S-SA-SB) Economy step, .074 inch (1.88 mm) diameter; middle step tapers to .0682 inch (1.73 mm) diameter; power step .040 inch (1.02 mm) diameter. (741S-SA-SB) Economy step, .072 inch (1.83 mm) diameter; middle step tapers to .068 inch (1.73 mm) diameter; power step .043 inch (1.09 mm) diameter.

Metering Rod Jet: (740S-SA-SB) size No. 41 (2.44 mm) drill. (741S-SA-SB) size .0945 inch (2.40 mm) diameter.

Metering Rod Setting: See adjustments.

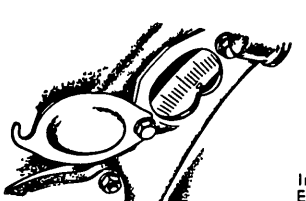
Accelerating Pump: Diaphragm type, vacuum and mechanically operated.
Pump jet size, (740S early production and 741S-SA-SB) No. 72 (.64 mm) drill, (740S late production and 740SA-SB) No. 70 (.71 mm) drill.
Intake passage (in diaphragm housing), (740S early production and 741S-SA-SB) No. 72 (.64 mm) drill, (740S late production and 740SA-SB) No. 75 (.53 mm) drill.
Vacuum restriction (in flange) size No. 55 (1.32 mm) drill.
Vacuum passage (diaphragm bleed) size No. 65 (.89 mm) drill.



Pump Stroke: No adjustment.

Choke: Manual, interconnected with throttle. Valve, offset butterfly type.

Vacuum Spark Port: Slot (round end) type. Size .110 by .040 inch (2.79 by 1.02 mm). Bottom of port (740S-SA, 741S-SA-SB) .014-.024 inch (.36 to .61 mm), (740SB) .007-.017 inch (.18-.43 mm), above top edge of valve with valve tightly closed.



Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

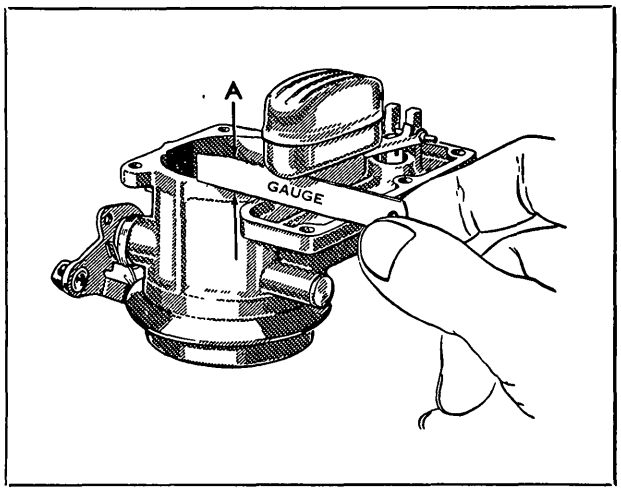

Figure 1
Float Adjustment

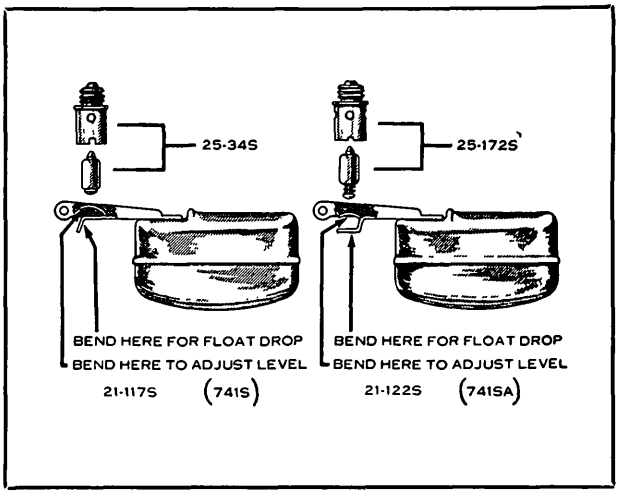

Figure 2
Float and Needle and Seat Assembly

FLOAT ADJUSTMENT (Fig. 1):

With gasket removed and bowl cover assembly inverted, the distance (A) from the bowl cover to the top of float should be 25/64" (gauge T109-206) (740S-SA-SB), 7/16" (gauge T109-81) (741S), 5/16" (gauge T109-107) (741SA-SB), with free weight of float on seated needle. Adjust by bending lip of float, not float arm.

741SA-SB float setting must be checked with bowl cover held at eye height in a level position.

Float drop: (741SA-741SB) With bowl cover assembly held in upright position, the distance between free end of float and bowl cover should be 1-3/16 inch. Adjust by bending stop tabs on float arm.

FLOAT AND NEEDLE AND SEAT ASSEMBLY (Fig. 2):

741S may be brought up to 741SA specifications by changing 21-117S float to 21-122S float, and 25-34S needle and seat assembly to 25-172S needle, pin, spring and seat assembly. Then reset float level to 5/16 inch.

When installing 25-172S needle, pin, spring and seat assembly, included in Repair Parts Package No. 1545A, float and lever assembly 21-122S must be used.

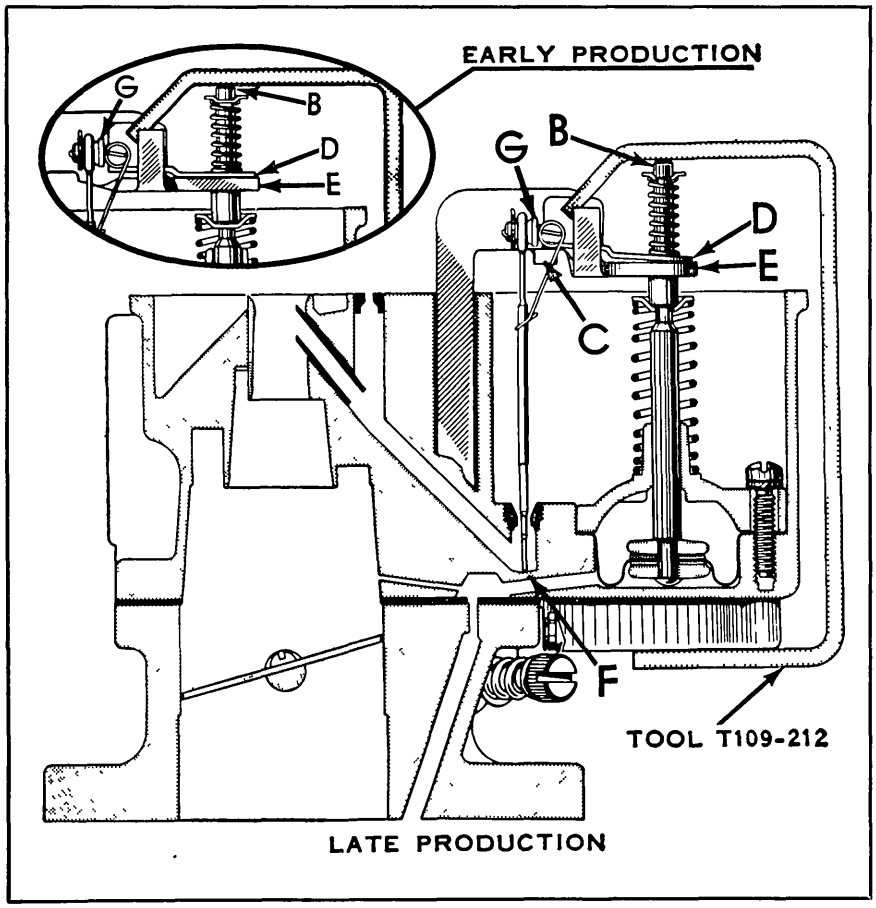

Figure 3
Metering Rod Adjustment

METERING ROD ADJUSTMENT (Fig. 3):

This adjustment is important and should be checked each time the carbureter is reassembled or lean rods are installed. With throttle valve seated in bore of carbureter, press down on upper end of diaphragm shaft (B) until diaphragm bottoms in vacuum chamber. (Tool T109-212 may be used to hold diaphragm down while adjusting metering rod.)

On late production carbureters, which have projection (C) on pump lifter link, metering rod should contact bottom of metering rod well (F) and metering rod arm (D) should contact lifter link (E) between springs and at supporting lug (C). Adjust by bending lip (G) up or down.

On early production carbureters, which do not have projection (C) on pump lifter link, metering rod should bottom in metering rod well (F) and flat of metering rod arm (D) should make parallel contact with flat of pump lifter link (E). Adjust by bending lip (G) up or down.

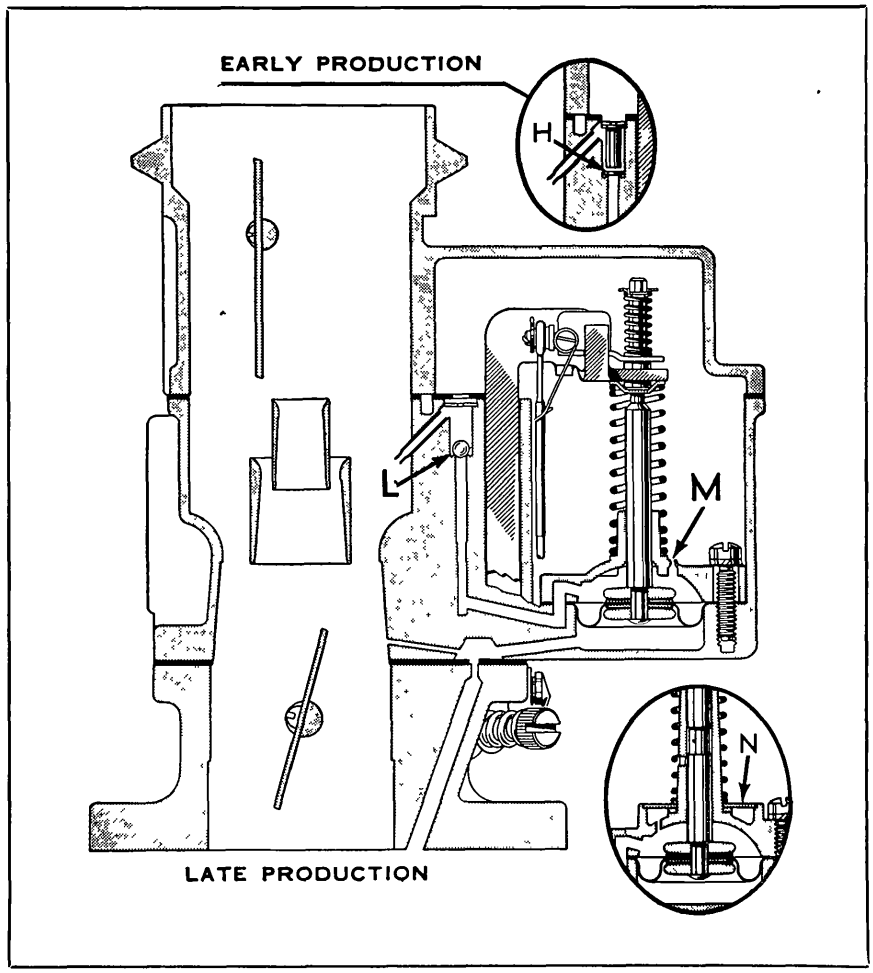

Figure 4
Accelerating Pump

ACCELERATING PUMP (Fig. 4):

If acceleration is not satisfactory, remove pump disk retainer ring, retainer, and pump check disk (H) (740S-741S-741SA) or pump discharge ball check (L) (740SA-SB-741SB). Then remove pump diaphragm assembly. Check diaphragm for wear or damage. Be sure inlet hole (M) is not clogged with lint or foreign matter. Intake screen (N) (if so equipped) should be removed in service.

If carbureter is equipped with disk type discharge check replace with aluminum ball check. Unitized Package (Part No. 116-26U) consisting of (1) 1/8" steel ball, (1) 1/8" aluminum ball, and (1) 63-152 retainer should be used. Complete instructions for this conversion are contained in the package. If the discharge ball or seat in late production carbureters, originally equipped with aluminum ball check, appear damaged, 116-26U should be used.

Inspect and replace all worn or damaged parts and clean and blow out all passages with compressed air. Make sure discharge check seats in casting as a leak at this point will result in poor acceleration.

FAST IDLE ADJUSTMENT (Fig. 5):

With choke held in wide open position, lip (J) on fast idle arm should contact boss on body casting. Adjust by bending at offset of fast idle link (K).

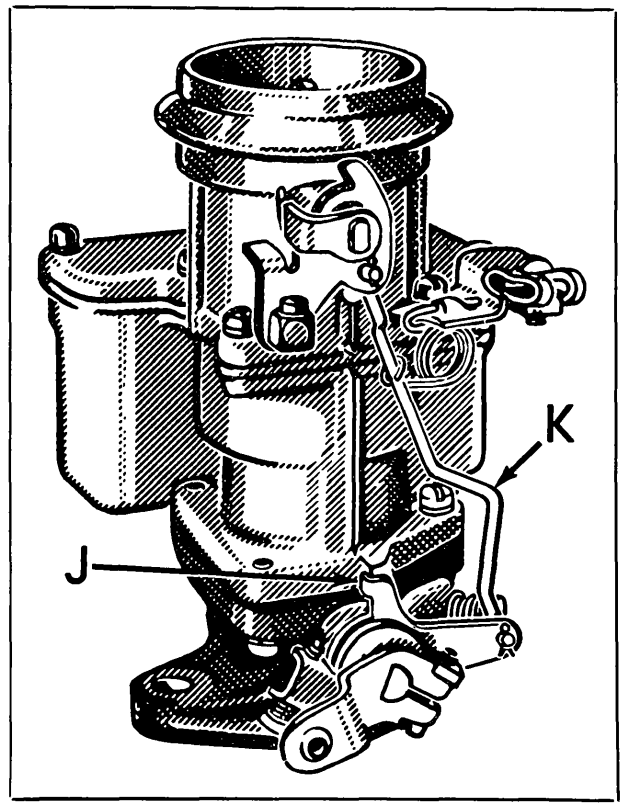

Figure 5
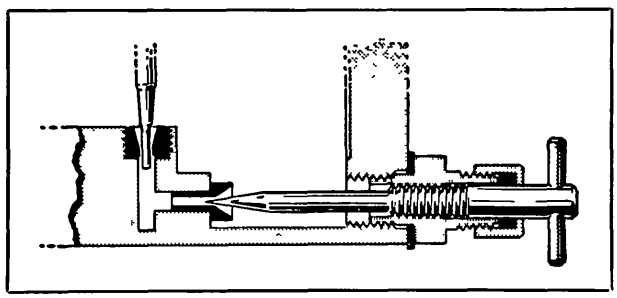
Fast Idle Adjustment



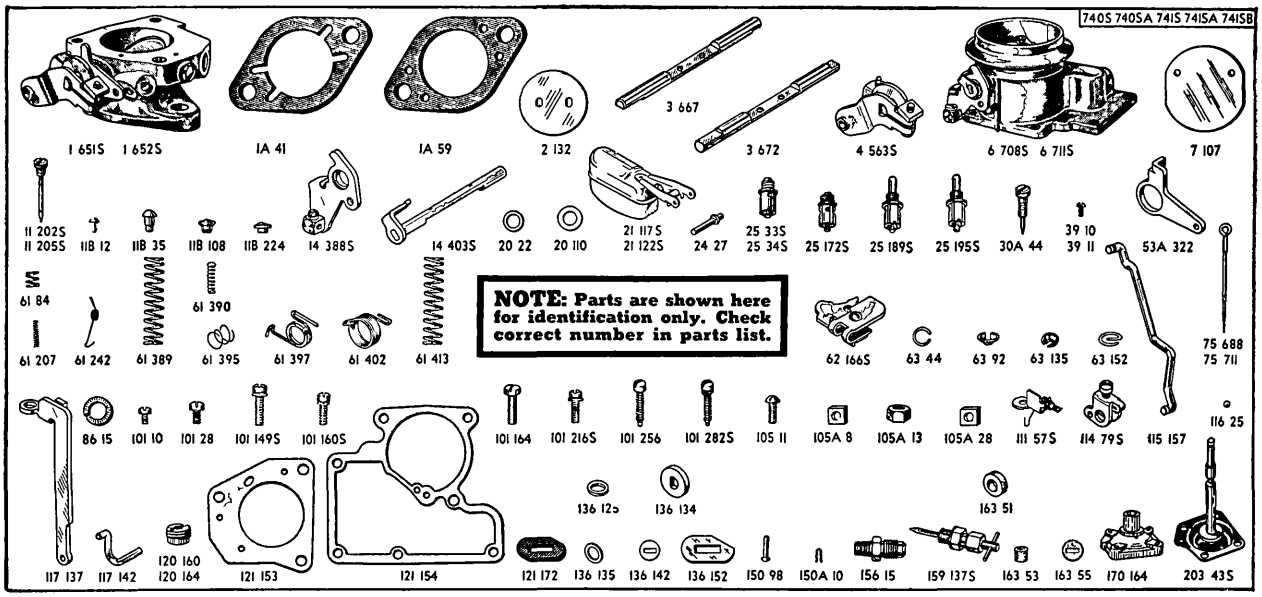


Figure 6
Main Metering Screw Adjustment

MAIN METERING SCREW ADJUSTMENT (Fig. 6):

To adjust the carbureter for best economy with the engine warmed up, speed up engine on floor with the throttle stop screw or hand throttle to a speed corresponding to approximately 30 m.p.h. Screw high speed needle in a clockwise direction until the engine begins to lose speed. Turn screw back in an anti-clockwise direction until the maximum speed is attained.

International Trucks, 1950-53—Nos. 740S-SA-SB, 741S-SA-SB

REPAIR PACKAGE No. 1544C FOR 740S-740SA-740SB, No. 1545B FOR 741S-741SA-741SB; GASKET ASSORTMENT No. 197B

PART NAMES IN CAPITAL LETTERS, LISTED BELOW, INDICATE CONTENTS OF REPAIR PACKAGE

Part No	PART NAME
1-651S	Body flange assembly (740S-SA-SB)
1-652S	Body flange assembly (741S-SA-SB)
1A-41	FLANGE GASKET—FOR USE WITHOUT GOVERNOR
1A-59	Flange gasket—for use with governor
2-132	Throttle valve
3-667	Throttle shaft (741S-SA-SB)
3-672	Throttle shaft (740S-SA-SB)
4-563S	Throttle lever assembly
6 642S	Air horn assy (741S-741SA) (Sup by 6-711S)
6-648S	Air horn assy (740S) (Sup by 6-708S)
6 708S	Air horn assembly (740S-SA-SB)
6-711S	Air horn assembly (741S-SA-SB)
7-107	Choke valve
11 202S	LOW SPEED JET ASSEMBLY (740S-SA-SB)
11 205S	LOW SPEED JET ASSEMBLY (741S-SA-SB)
11B-12	Flange passage plug
11B-35	Nozzle passage rivet plug
11B-79	Rivet plug (740SB-741SB) (2)
11B-108	IDLE PORT RIVET PLUG
11B-224	Choke shaft rivet plug
14-388S	Choke lever assembly
14-403S	Choke shaft and lever assembly
20 22	Needle seat gasket
20-110	Adjustable main jet gasket
21-117S	Float and lever assembly (740S-SA-SB-741S)
21-122S	†Float and lever assembly (741SA-SB)

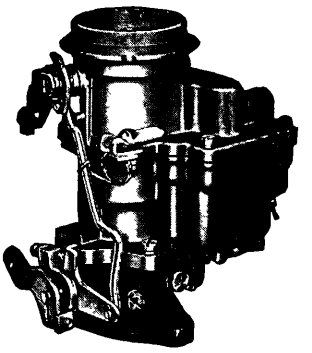
25-195S	Needle, pin, spring and seat assy (741SB)
30-62	Pump intake strainer (740S-741S-SA) (Discontinued)
30A-44	Idle adjustment screw
39-10	Choke valve attaching screw (2)
39-11	THROTTLE VALVE ATTACHING SCREW (2)
53A-322	Fast idle arm
61-84	Idle screw spring
61-207	Intake needle spring (741SA-SB)
61-242	Metering rod spring
61-389	PUMP DIAPHRAGM SPRING (STD) (741S-SA-SB) (Sup by 61-451 on 740S-SA)
61-390	Upper pump spring
61-395	SHAFT SEAL SPRING
61-397	Fast idle connector rod spring
61-402	Choke lever spring
61-413	Pump diaphragm spring (for high alt use)
61-451	PUMP DIAPHRAGM SPRING (STD) (740S-SA-SB)
62-166S	Choke tube clamp assembly
63-44	Choke lever retaining ring
63-92	DIAPHRAGM SPRING RETAINER
63-135	UPPER PUMP SPRING RETAINER
63-138	Pump disc retainer ring (740S-741S-SA) (Sup by 63-152)
63-139	Pump disc retainer (740S-741S-SA) (Sup by 116-26U)
63-152	Pump discharge ball check retainer ring
75-688	METERING ROD—STD (741S-SA-SB) 072"- 072" to 068"- 043"
75-711	Metering rod—std (740S-SA) 069"- 0655" to 0585"- 040" (Sup by 75-869)
75 869	METERING ROD (STD) (740S-SA-SB)
86 15	Flange stud lock washer (2)
101-10	Wire clamp screw
101-28	Throttle shaft arm attaching screw
101-149S	Body flange attaching screw and washer assembly (3)
101 160S	Air horn attaching screw and washer assembly (5)
101-164	Throttle lever clamp screw
101-216S	Air horn attaching screw and washer assembly (2)
101 256	Throttle lever adjustment screw
101-282S	Diaphragm housing attaching screw and washer assembly (4)
105-11	Tube clamp screw
105A-8	Tube clamp nut
105A-13	Flange nut (2)
105A-28	Throttle lever nut
111-57S	Metering rod arm assembly
114-79S	THROTTLE SHAFT ARM ASSEMBLY
115-157	Fast idle connector rod
116-25	Pump discharge ball check
116-26U	UNITIZED PACKAGE (consists of (1) 116-11, (1) 116-25 and (1) 63-152)
117-137	PUMP LIFTER LINK
117-142	PUMP CONNECTOR LINK
120 160	METERING ROD JET (740S-SA-SB)
120-164	METERING ROD JET (741S-SA-SB)
121-153	BODY FLANGE GASKET
121 154	BOWL COVER AND AIR HORN GASKET
121-172	LIFTER LINK SEAL GASKET (740SA-SB-741SB)
136-125	DUST SEAL RETAINER
136-134	Throttle shaft washer
136 135	DUST SEAL WASHER
136 142	PUMP LIFTER LINK WASHER (740S-741S-SA)
136-152	Lifter link seal washer (740SA-SB-741SB)
150 98	Intake needle pin (741SA-SB)
150A-10	PIN SPRING (2)
156-15	Gas line nipple
159-137S	Adjustable main metering screw assembly
163-51	DUST SEAL (2)
163-53	Main metering screw packing
163-55	PUMP LIFTER LINK PACKING LEATHER (740S-741S-SA)
169-22	Pump check disc (740S-741S-SA) (Sup by 116-26U)
170-150	Pump diaphragm housing (741S-SA-SB) (Sup by 170-164 on 740S)
170-164	Pump diaphragm housing (740S-SA-SB)
203 43S	DIAPHRAGM ASSEMBLY

†Note 741S may be brought up to 741SA specifications by changing 21-117S to 21-122S, 25-34S to 25-172S and resetting float level to 5/16 inch



NOTE Figures in parentheses indicate number of pieces used in one carbureter Where no figure is shown, only one is used

CARBURETER ADJUSTMENTS

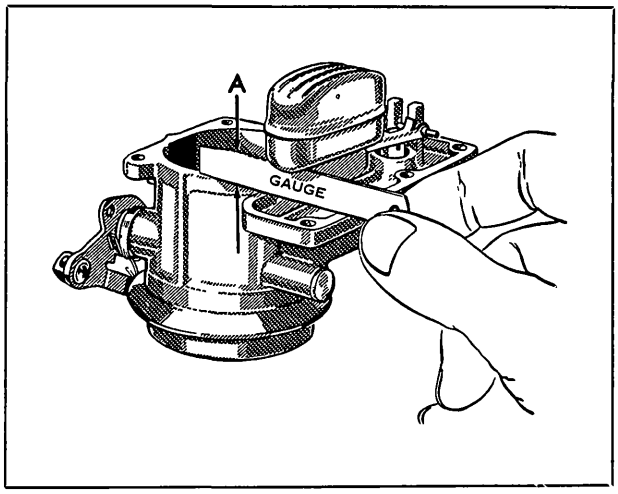

Figure 1

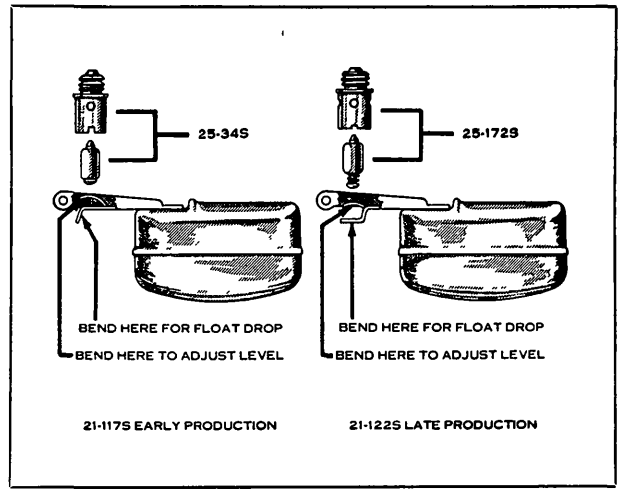

Figure 1A
Float and Needle and Seat Assembly

FLOAT ADJUSTMENT (Fig. 1):

With gasket removed, bowl cover assembly inverted and float resting on seated needle, the distance (A) from the bowl cover to the top of float should be 25/64" (gauge T109-206) (735S-SA), 7/16" (gauge T109-81) (736S) and 5/16" (gauge T109-107) (736SA-SB). Adjust by bending lip of float, not float arm

736SA-SB float setting must be checked with the bowl cover held at eye height in a level position.

Float drop: (736SA-736SB) With bowl cover assembly held in upright position, the distance between free end of float and bowl cover should be 1-3/16 inch. Adjust by bending stop tabs on float arm.

FLOAT AND NEEDLE AND SEAT ASSEMBLY (Fig. 1A):

736S may be brought up to 736SA specifications by changing 21-117S float to 21-122S float, and 25-34S needle and seat assembly to 25-172S needle, pin, spring and seat assembly. Then reset float level to 5/16 inch.

When installing 25-172S needle, pin, spring and seat assembly, included in Repair Package No. 1531A, float and lever assembly 21-122S must be used.

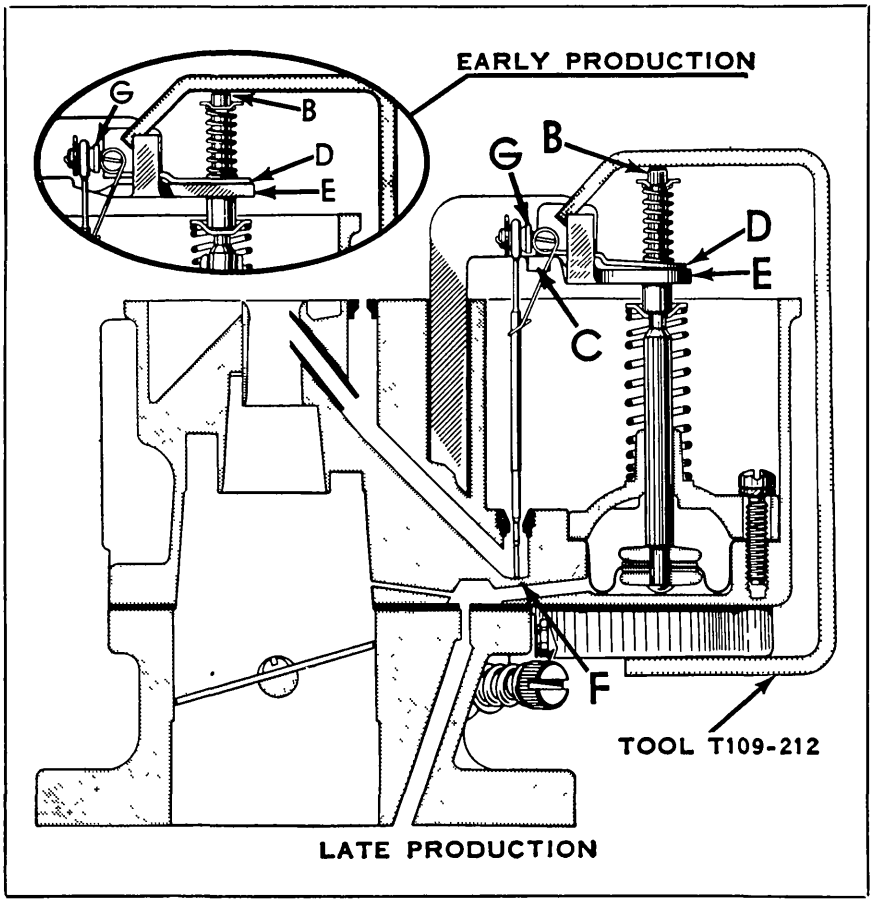

Figure 2
Metering Rod Adjustment

METERING ROD ADJUSTMENT (Fig. 2):

This adjustment is important and should be checked each time the carbureter is reassembled or lean rods are installed With throttle valve seated in bore of carbureter, press down on upper end of diaphragm shaft (B) until diaphragm bottoms in vacuum chamber. (Tool T109-212 may be used to hold diaphragm down while adjusting metering rod.)

On late production carbureters, which have projection (C) on pump lifter link, metering rod should contact bottom of metering rod well (F) and metering rod arm (D) should contact lifter link (E) between springs and at supporting lug (C). Adjust by bending lip (G) up or down.

On early production carbureters, which do not have projection (C) on pump lifter link, metering rod should bottom in metering rod well (F) and flat of metering rod arm (D) should make parallel contact with flat of pump lifter link (E). Adjust by bending lip (G) up or down.

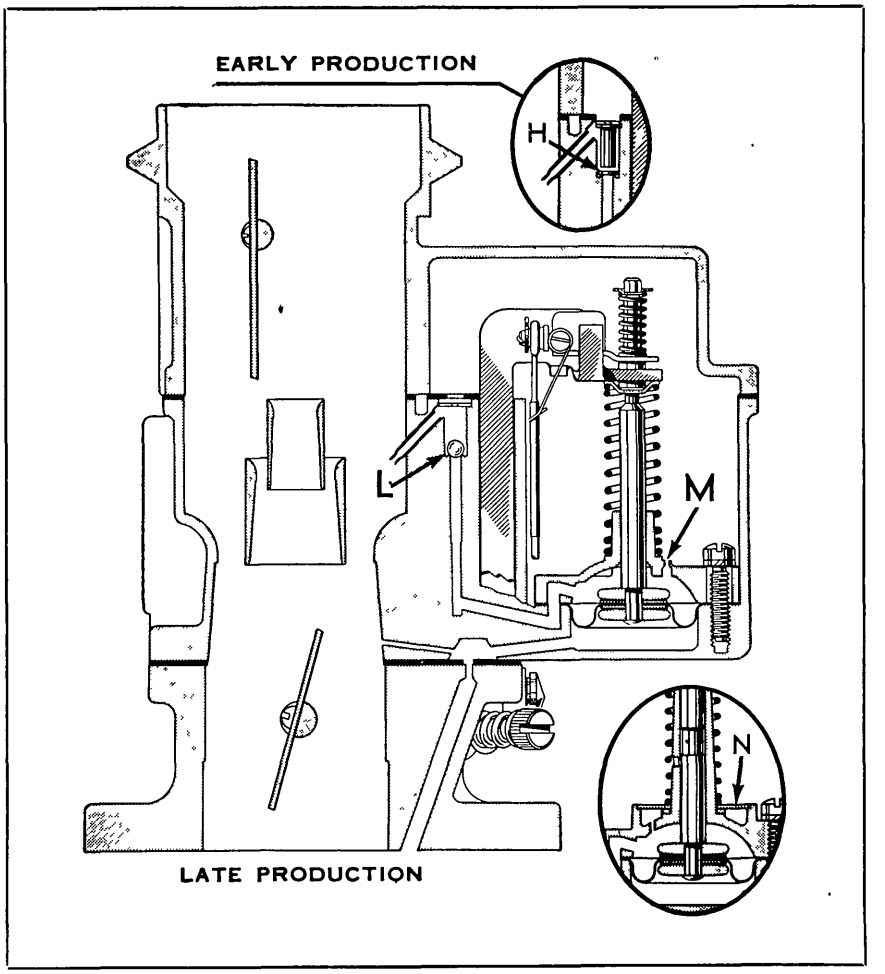

Figure 3
Accelerating Pump

ACCELERATING PUMP (Fig. 3):

If acceleration is not satisfactory, remove pump disk retainer ring, retainer, and pump check disk (H) (735S-736S-736SA) or pump discharge ball check (L) (735SA-736SB). Then remove pump diaphragm assembly. Check diaphragm for wear or damage. Be sure inlet hole (M) is not clogged with lint or foreign matter. Intake screen (N) (if so equipped) should be removed in service.

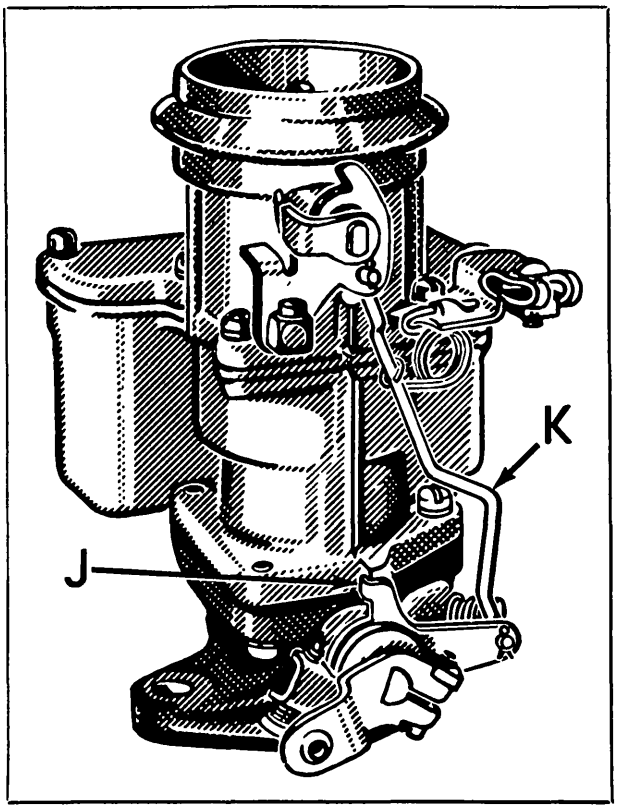
If carbureter is equipped with disk type discharge check replace with aluminum ball check. Unitized Package (Part No. 116-26U) consisting of (1) 1/8" steel ball, (1) 1/8" aluminum ball, and (1) 63-152 retainer should be used. Complete instructions for this conversion are contained in the package. If the discharge ball or seat in late production carbureters, originally equipped with aluminum ball check, appear damaged, 116-26U should be used.

Inspect and replace all worn or damaged parts. Clean and blow out all passages with compressed air. Make sure discharge check seats in casting as a leak at this point will result in poor acceleration

FAST IDLE ADJUSTMENT (Fig. 4):

With choke held in wide open position, lip (J) on fast idle arm should contact boss on body casting. Adjust by bending at offset of fast idle link (K).

Note: This adjustment is not necessary on early production carbureters.



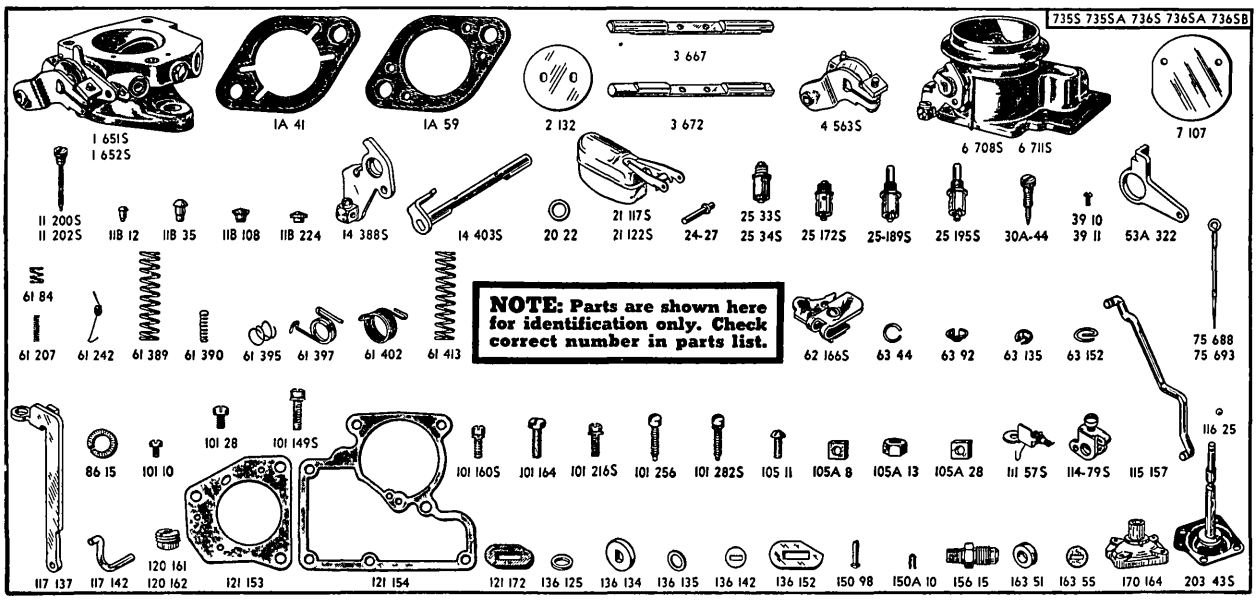


Figure 4
Fast Idle Adjustment

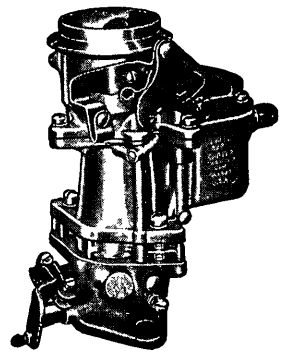
21-117S	Float and lever assembly (735S-SA-736S)
21-122S	†Float and lever assembly (736SA-SB)
24-27	Float lever pin
25-33S	NEEDLE AND SEAT ASSEMBLY (735S)
25-34S	Needle and seat assembly (736S)
25-172S	†NEEDLE PIN SPRING AND SEAT ASSEMBLY (736SA)
25 189S	Needle and seat assembly (735SA)
25-195S	NEEDLE PIN SPRING AND SEAT ASSEMBLY (736SB)
30 62	Pump intake strainer (735S-736S-SA) Discontinued
30A-44	Idle adjustment screw
39-10	Choke valve attaching screw (2)
39-11	THROTTLE VALVE ATTACHING SCREW (2)
53A-317	Fast idle arm (Sup by 53A-322)
53A-322	Fast idle arm
61-84	Idle screw spring
61-207	Intake needle pin spring (736SA-SB)
61-242	Metering rod spring
61-389	PUMP DIAPHRAGM SPRING (STD)
61-390	Upper pump spring
61-395	SHAFT SEAL SPRING
61-397	Fast idle connector rod spring
61-402	Choke lever spring
61-413	Pump diaphragm spring (for high alt use)
62-166S	Choke tube clamp assembly
63-44	Choke lever retaining ring
63-92	DIAPHRAGM SPRING RETAINER
63-135	UPPER PUMP SPRING RETAINER
63-138	Pump disc retainer ring (735S-736S-SA) (Sup by 63-152)
63-139	Pump disc retainer (735S-736S-SA) (Sup by 116-26U)
63-152	Pump discharge ball check retainer ring
75-688	METERING ROD (STD) (736S-SA-SB)
75-693	METERING ROD (STD) (735S-SA)
75-752	Metering rod (1 size lean) (735S-SA)
75-753	Metering rod (2 sizes lean) (735S-SA)
75-756	Metering rod (1 size lean) (736S-SA-SB)
75-757	Metering rod (2 sizes lean) (736S-SA-SB)
86-15	Flange stud lock washer
101-10	Wire clamp screw
101-28	Throttle shaft arm attaching screw
101-149S	Body flange attaching screw and washer assembly (3)
101-160S	Air horn attaching screw and washer assembly (5)
101-164	Throttle lever clamp screw
101-216S	Air horn attaching screw and washer assembly (2)
101-256	Throttle lever adjustment screw
101-282S	Diaphragm housing attaching screw and washer assembly (4)
105-11	Tube clamp screw
105A-8	Tube clamp nut
105A-13	Flange nut
105A-28	Throttle lever nut
111-57S	Metering rod arm assembly
114-79S	THROTTLE SHAFT ARM ASSEMBLY
115-152	Fast idle connector rod (Sup by 115-157)
115-157	Fast idle connector rod
116-25	Pump discharge ball check
116-26U	UNITIZED PACKAGE (Consists of (1) 116-11, (1) 116-25 and (1) 63-152)
117-137	PUMP LIFTER LINK
117-142	PUMP CONNECTOR LINK
120-161	METERING ROD JET (735S-SA)
120-162	METERING ROD JET (736S-SA-SB)
120-171	‡Metering rod jet (1 size rich) (735S-SA)
121-153	BODY FLANGE GASKET
121-154	BOWL COVER AND AIR HORN GASKET
121-172	LIFTER LINK SEAL GASKET (735SA-736SB)
136-125	DUST SEAL RETAINER
136-134	Throttle shaft washer
136-135	DUST SEAL WASHER
136-142	PUMP LIFTER LINK WASHER (735S-736S-SA)
136-152	Lifter link seal washer (735SA-736SB)
150-98	Intake needle pin (736SA-SB)
150A-10	PIN SPRING (2)
156-15	Gas line nipple
163-51	FELT DUST SEAL (2)
163-55	PUMP LIFTER LINK PACKING LEATHER (735S-736S-SA)
169-22	Pump check disc (735S-736S-SA) (Sup by 116-26U)
170-150	Pump diaphragm housing (736S-SA-SB) (Sup by 170-164 on 735S)
170-164	Pump diaphragm housing (735S-SA)
203-43S	PUMP DIAPHRAGM ASSEMBLY

†Note 736S may be brought up to 736SA specifications by changing 21-117S to 21-122S, 25-34S to 25-172S and resetting float level to 5/16 inch

‡When using 120-171 metering rod jet (1 size rich), 170-164 pump diaphragm housing must be used



NOTE Figures in parentheses indicate number of pieces used in one carbureter Where no figure is shown, only one is used

TRUCK MODELS

L170 and L180 Series with BD-269 Engine No. 62501 and Higher—1952

R170 Series—1953

(All Previous Models of L, K and KB Series Using BLD269 and BD269 Engines Converted to 6 5 Compression Ratio)

INTERNATIONAL TRUCK 1941-1953

BBR1—Down-Draft Carbureter **No. 980S** (I H. No 112908-R91)

(May be used with or without sandwich velocity governor, using standard flange gasket 1A-41)

CARBURETER SPECIFICATIONS

For 6 Cylinder International Engine Model BD-269—3-9/16 Inch Bore, 4½ Inch Stroke

Dimensions Flange size 1¼ inch S A E Throttle bore 1 9/16 inch (39 69 mm) Main venturi 1 5/16 inch (33 38 mm)

Float Setting Top of float 5/64 inch (1 98 mm) plus or minus 1/64 inch (397 mm) below top surface of carbureter body casting

Vents Outside none Inside balance vent tube

Gasoline Intake Needle Triangular horizontal No 44 (086 inch) (2 18 mm) drill in needle seat

Idle Orifice Tube Jet size 031 inch (79 mm) Idle passage air bleed (in body) size 063 inch (1 60 mm) Restriction (n body) size 054 055 inch (1 371 1 397 mm)

Idle Ports Upper port slot type length 180 inch (4 57 mm) Width 030 inch (76 mm) Top of port located 138 to 142 (3 50 to 3 61 mm) above top edge of valve Lower port size 053 to 057 inch (1 35 to 1 45 mm) diameter (For idle adjustment screw)

Set Idle Adjustment Screw ¼ to 1¼ turns open For richer mixture turn screw out Do not idle engine below 400 r p m or 6 m p h

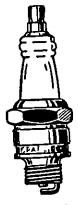
Main Metering Jet Calibrated to flow 362 to 366 cc per minute

Main Vent Through diffuser (air bleed inside bowl) size 0394 inch (1 00 mm) drill

Main Vent Tube Side holes 6—0354 inch diameter

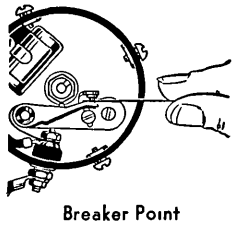
Step Up Jet 0374 inch (95 mm) drill

Accelerating Pump Type delayed action Summer setting (inner hole short stroke) Winter setting (outer hole long stroke) Pump intake passage ball check seat size 107 to 112 inch (2 72 to 2 85 mm) diameter Pump discharge pas sage Restriction (under ball check) size 062 to 065 inch (1 58 to 1 65 mm) diameter in body Pump (discharge) jet size 0315 inch (80 mm) drill



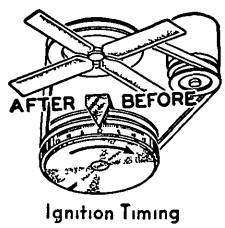
Pump Adjustment 24/64 inch plunger travel full throttle posi tion short stroke Use gauge T109 117S

Choke Manual—Offset butterfly type with poppet valve Choke valve stops at 8½° from wide open position



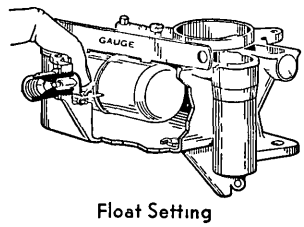
Vacuum Spark Port None

Motor Tune-Up—Be Accurate!

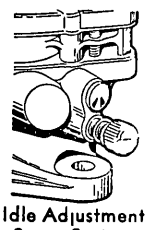


CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter

Spark Plug Gap 028" 033"



Breaker Point Setting 018" 024"



Ignition Timing Breaker Points to Open T D C

Valve Setting (Hot) Intake 018"-020" Exhaust 018"-020"

Float Setting 5/64 Inch (Use Gauge T109-50)

Idle Adjustment Screw Setting ¼ to 1¼ Turns Open

CARBURETER ADJUSTMENTS

For most satisfactory starting during extremely cold weather, pull out choke, crack throttle about one-half open and then engage starter

If carbureter loads up after considerable service check float level Wear on lip of float lever will raise float level Before adjusting float be sure float lever pin is firmly seated Reset by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level Bend vertical lip of float only

If motor stalls while idling, set throttle lever adjusting screw so motor runs approximately 400 r p m Then set idle adjustment screw to specifications If these adjustments do not correct the trouble remove idle orifice tube and plug assembly and clean tube and passages with compressed air

If acceleration is not satisfactory remove pump jet and clean with compressed air, however, it is usually advisable to replace the pump jet as its cost is nominal All jets must be seated gasoline tight Poor acceleration may be due to

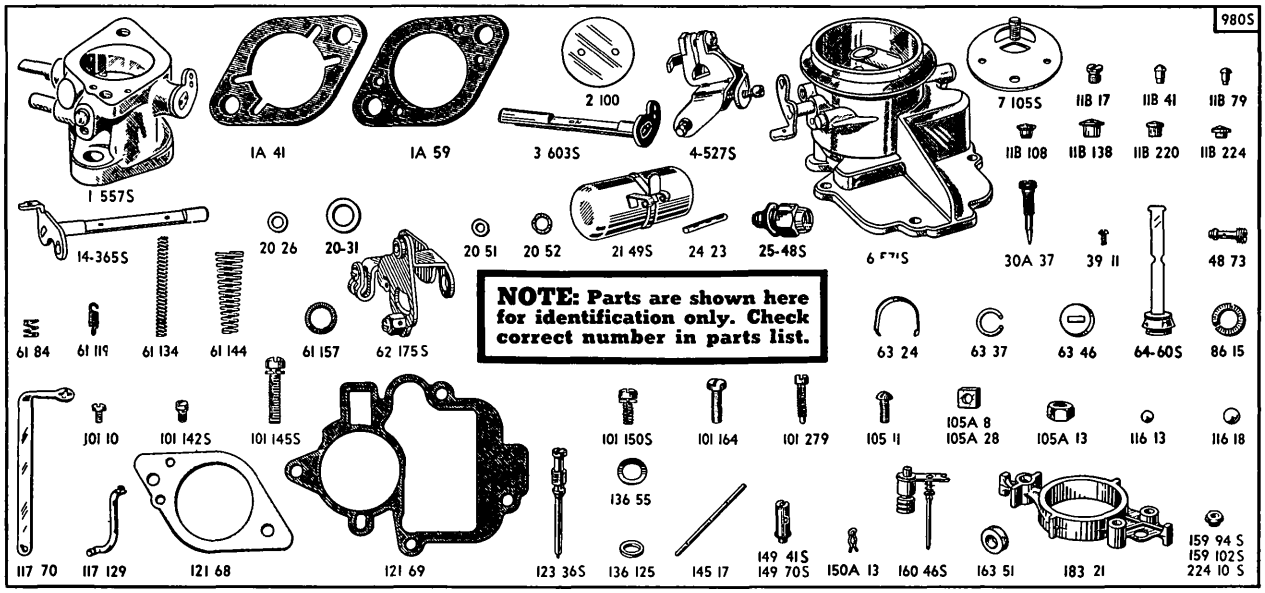
CARBURETER
TRADE MARK REG U S PAT OFF.
MARCA REGISTRADA

PRINTED IN U S A



damaged or worn plunger leather in accelerating pump, sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather

Correct air fuel ratio is provided by a 'balance tube located in the air horn The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type size or condition of air cleaner Should the cleaner become clogged the capacity will be reduced but the air-fuel mixture ratio will not be changed

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with tool No T109 210 main vent tube can be removed and a new tube inserted with tool No T109-195 Care must be exercised in inserting new tube which must seat tightly Use new rivet to complete the installation

Pump Adjustment Remove air horn assembly, back out throttle lever adjustment screw and install pump operating link in inner hole (short stroke) of throttle shaft arm Place base of pump travel gauge T109-117S on upper edge of body of casting at pump cylinder With throttle valve seated, turn gauge until projecting finger contacts top of plunger shaft Note number on gauge Repeat with throttle valve wide open and plunger pressed to bottom of the cylinder The difference between the numbers indicated at wide open and closed throttle positions should be '24 (24/64' pump stroke) Adjust by bending horizontal portion of pump lifter link

Pump stroke is adjustable for high or low temperature Set to longest stroke (outer hole) for cold weather, shorter stroke (inner hole) for hot weather driving

International Truck 1941-1953—Carbureter No. 980S

EXPORT AND HIGH ALTITUDE

BBR1—Downdraft Carbureters—**Models 686S-686SA** (International No. 71429-R92)

CARBURETER SPECIFICATIONS

For 6 Cylinder Engine, Model BLD 250—3-7/16" Bore; 4½" Stroke (Truck Models K-6, KB-6)
For 6 Cylinder Engine, Models BLD 269, BD 269—3-9/16" Bore; 4½" Stroke (Truck Models K-7, KB-7)

Dimensions: Flange size, 1¼ inch S. A. E.
Throttle bore, 1-9/16 inch (39.69 mm).
Main venturi, 1-5/16 inch (33.38 mm).

Float Setting: Top of float 5/64 inch (1.98 mm) plus or minus 1/64 inch (.397 mm) below top surface of carbureter body casting.

Vents: Outside, none. Inside, balance vent .218 inch (5.54 mm) diameter.

Gasoline Intake Needle: Triangular, horizontal. No. 44 (2.18 mm) drill in needle seat.

Idle Orifice Tube: Jet size, .031 inch (.79 mm). Idle passage air bleed (in body) size, .0635 inch (1.60 mm). Restriction (in body) size .054-.055 inch (1.371-1.397 mm).

Idle Ports: Upper port, slot type; length, .180 inch (4.57 mm). Width, .030 inch (.76 mm). Top of port located .138 to .142 inch (3.50 to 3.61 mm) above top edge of valve. Lower port size, .053 to .057 inch (1.35 to 1.45 mm) diameter. (For idle adjustment screw.)

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture, turn screw out. Do not idle engine below 400 r.p.m. or 6 m.p.h.

Main Metering Jet: Calibrated to flow 146 to 150 cc per minute.

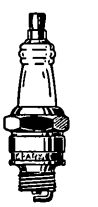
Main Metering Screw: Adjustable. Jet size: (686S) .059 inch (1.50 mm) drill. (686SA) No. 49 (.073 inch) (1.85 mm) drill.

Main Vent: Through diffuser (air bleed inside bowl) size .0394 inch (1.00 mm) drill.

Main Vent Tube: Side holes, 6—.0354 inch diameter.

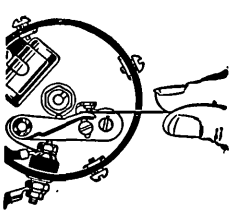
Step-Up Jet: .0374 inch (.95 mm) drill.

Accelerating Pump: Type, delayed action. Summer setting (inner hole, short stroke). Winter setting (outer hole, long stroke). Pump intake passage, ball check seat, size .115 to .120 inch (2.93 to 3.05 mm) diameter.
Pump discharge passage: Restriction (under ball check) size .062 to .065 inch (1.58 to 1.65 mm) diameter in body.
Pump (discharge) jet size .0315 inch (.80 mm) drill.



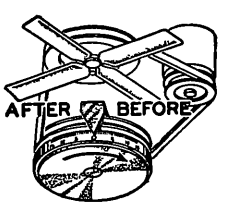
Pump Adjustment: 24/64 inch plunger travel; full throttle position, short stroke. Use gauge T109-117S.

Choke: Offset butterfly type, with poppet valve. Choke valve stops at 8½° from wide open position.



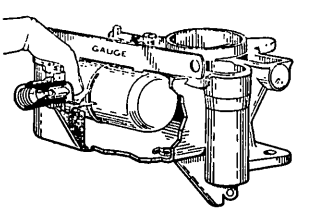
Vacuum Spark Port: None.

Motor Tune-Up—Be Accurate!

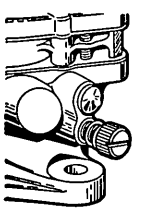


CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .028"-.032"



Breaker Point Setting .018"-.024"



Ignition Timing
Breaker Points to Open:
3° B.T.D.C.

Valve Setting
(Hot) Int. .018"-.020"
(Hot) Exh. .018"-.020"

Float Setting (Use Gauge) 5/64 Inch

Idle Adjustment Screw Setting ½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

For most satisfactory starting during extremely cold weather, pull out choke, crack throttle about one half open and then engage starter.

If carbureter loads up after considerable service, check float level. Wear on lip of float lever will raise float level. Before adjusting float, be sure float lever pin is firmly seated. Reset by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level. Bend vertical lip of float only.

If motor stalls while idling, set throttle lever adusting screw so motor runs approximately 400 r.p.m. Then set idle adjustment screw to specifications. If these adjustments do

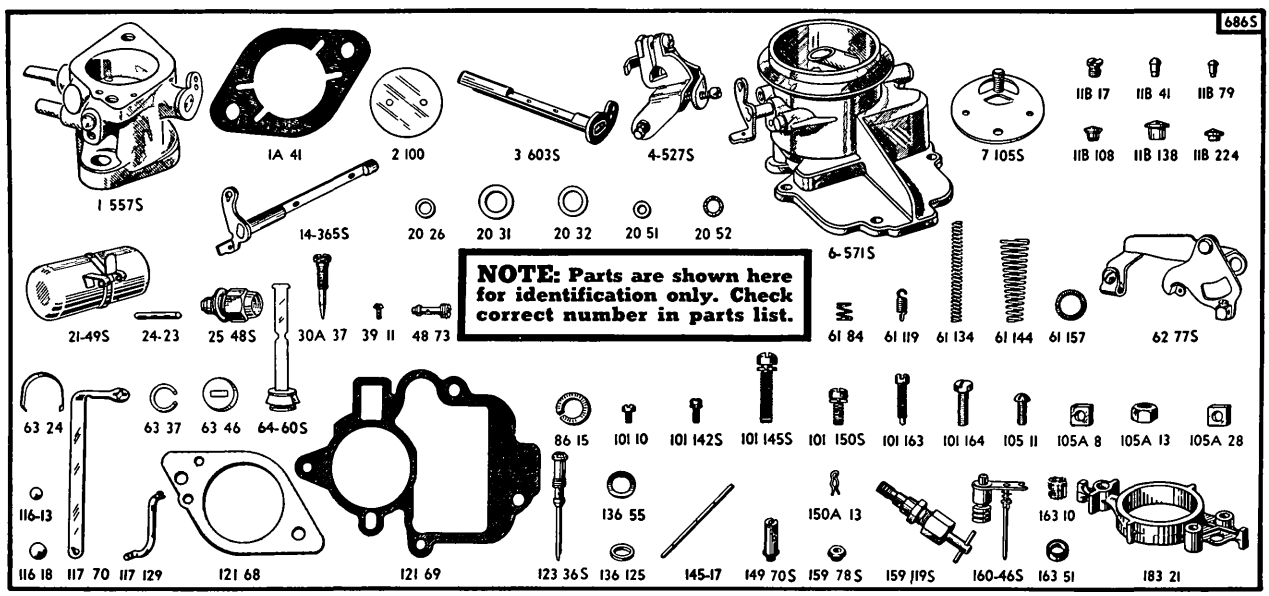
not correct the trouble, remove idle orifice tube and plug assembly and clean tube and passages with compressed air



If acceleration is not satisfactory, remove pump jet and clean with compressed air however, it is usually advisable to replace the pump jet as its cost is nominal All jets must be seated gasoline tight Poor acceleration may be due to damaged or worn plunger leather in accelerating pump sediment in pump cylinder or clogged ball check at bottom of pump cylinder and discharge ball check in discharge passage If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather

Correct air fuel ratio is provided by a 'balance tube" located in the air horn The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner Should the cleaner become clogged the capacity will be reduced but the air-fuel mixture ratio will not be changed

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube After removal of main metering screw assembly beneath float bowl, main vent tube can be removed and a new tube inserted with tool T109-195 Care must be exercised in inserting new tube which must seat tightly

Pump Adjustment Remove air horn assembly, back out throttle lever adjustment screw and install pump operating link in inner hole (short stroke) of throttle shaft arm Place base of pump travel gauge T109-117S on upper edge of body casting at pump cylinder With throttle valve seated turn gauge until projecting finger contacts top of plunger shaft Note number indicated on gauge Repeat with throttle valve wide open and plunger pressed to bottom of the cylinder The difference between the numbers indicated at wide open and closed throttle positions should be '24", (24/64' pump stroke) Adjust by bending horizontal portion of pump lifter link Pump stroke is adjustable for high or low temperature Set to long stroke (outer hole) for cold weather, short stroke (inner hole) for hot weather driving

Main Metering Screw Adjustment Using a tachometer and with engine operating at normal temperature, adjust throttle for an engine speed of approximately 2000 r p m. Open main metering screw until engine operates smoothly with the highest vacuum gauge reading Slowly tighten main metering screw until a slight reduction of engine speed can be noticed or vacuum gauge shows slight decrease Open screw slightly from this position until maximum R P M and vacuum is obtained—usually not more than ⅛ to ¼ turn Hold screw securely and tighten nut to lock screw in position

Float Setting: Top of float 5/64 inch (1.98 mm) plus or minus 1/64 inch (.397 mm) below top surface of carbureter body casting.

Vents: Outside, none. Inside, balance vent .218 inch (5.54 mm) diameter.

Gasoline Intake Needle: Triangular, horizontal. No. 44 (2.18 mm) drill in needle seat.

Idle Orifice Tube: Jet size, .031 inch (.79 mm). Idle passage air bleed (in body) size, .063 inch (1.60 mm). Restriction (in body) size .054-.055 inch (1.371-1.397 mm).

Idle Ports: Upper port, slot type; length, .180 inch (4.57 mm). Width, .030 inch (.76 mm). Top of port located .138 to .142 (3.50 to 3.61 mm) above top edge of valve. Lower port size, .053 to .057 inch (1.35 to 1.45 mm) diameter. (For idle adjustment screw.)

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture, turn screw out. Do not idle engine below 400 r. p. m. or 6 m. p. h.

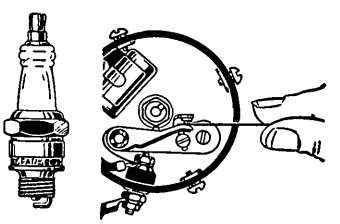
Main Metering Jet: Calibrated to flow 296 to 300 cc per minute.

Main Vent: Through diffuser (air bleed inside bowl) size, .0394 inch (1.00 mm) drill.

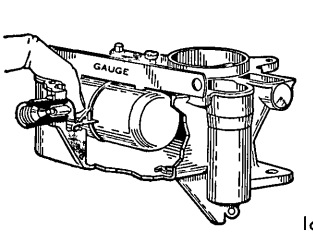
Main Vent Tube: Side holes, 6—.0354 inch diameter.

Step-up Jet: .0374 inch (.95 mm) drill (Early Production). No. 65 (.035 inch) drill (Late Production).

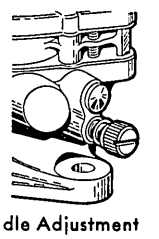
Accelerating Pump: Type, delayed action. Summer setting (inner hole, short stroke). Winter setting (outer hole, long stroke). Pump intake passage, ball check seat, size .115 to .120 inch (2.93 to 3.05 mm) diameter.
Pump discharge passage: Restriction (under ball check) size .062 to .065 inch (1.58 to 1.65 mm) diameter in body.
Pump (discharge) jet, size .0315 inch (.80 mm) drill.



Pump Adjustment: 24/64 inch plunger travel; full throttle position, short stroke. Use gauge T109-117S.



Choke: Manual—Offset butterfly type, with poppet valve. Choke valve stops at 8½° from wide open position.



Vacuum Spark Port: None.

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .028"-.032"

Breaker Point Setting .018"-.024"

Ignition Timing Breaker Points to Open: 3° B. T. D. C.

Valve Setting (Hot) Int. .018"-.020" (Hot) Exh. .018"-.020"

Float Setting (Use Gauge) 5/64 Inch

Idle Adjustment Screw Setting ½ to 1½ Turns Open

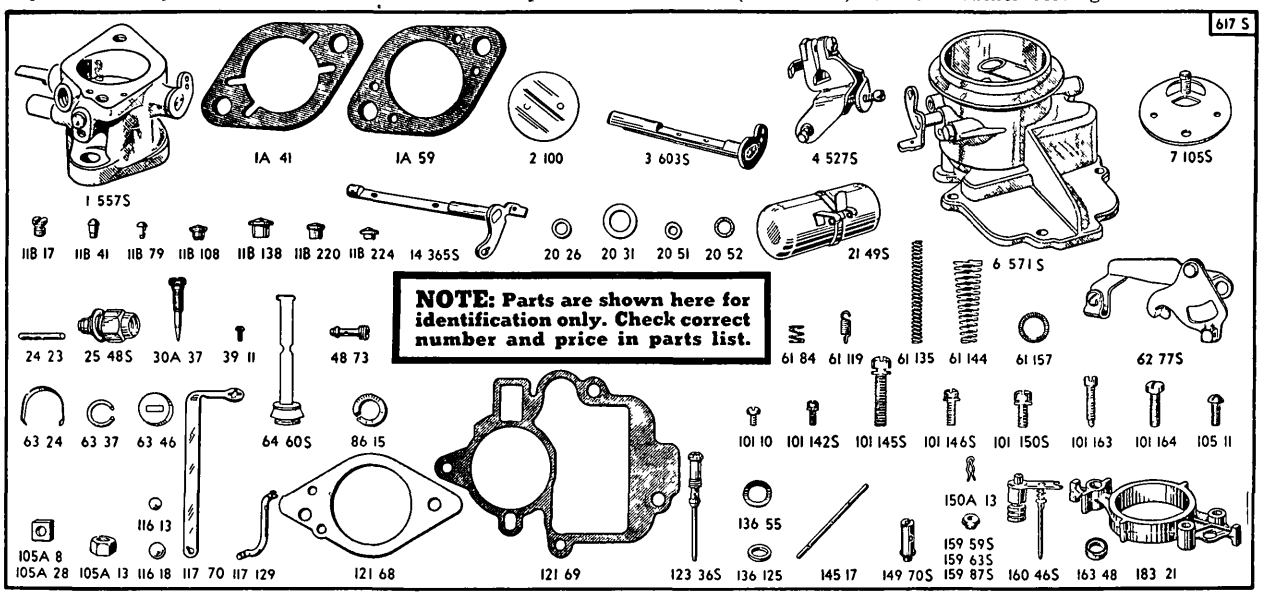
CARBURETER ADJUSTMENTS

For most satisfactory starting during extremely cold weather, pull out choke, crack throttle about one half open and then engage starter

If carbureter loads up after considerable service, check float level Wear on lip of float lever will raise float level Before adjusting float, be sure float lever pin is firmly seated Reset by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level Bend vertical lip of float only

If motor stalls while idling, set throttle lever adjusting screw so motor runs approximately 400 r p m Then set idle adjustment screw to specifications If these adjustments do not correct the trouble, remove idle orifice tube and plug assembly and clean tube and passages with compressed air



If acceleration is not satisfactory remove pump jet and clean with compressed air, however, it is usually advisable to replace the pump jet, as its cost is nominal All jets must be seated gasoline tight Poor acceleration may be due to damaged or worn plunger leather in accelerating pump, sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather

Correct air fuel ratio is provided by a "balance tube located in the air horn The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner Should the cleaner become clogged, the capacity will be reduced but the air-fuel mixture ratio will not be changed

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with tool No T109-43, main vent tube can be removed and a new tube inserted with tool No T109 195 Care must be exercised in inserting new tube which must seat tightly Use new rivet to complete the installation

Pump Adjustment Remove air horn assembly, back out throttle lever adjustment screw and install pump operating link in inner hole (short stroke) of throttle shaft arm Place base of pump travel gauge T109-117S on upper edge of body of casting at pump cylinder With throttle valve seated, turn gauge until projecting finger contacts top of plunger shaft Note number indicated on gauge Repeat with throttle valve wide open and plunger pressed to bottom of the cylinder The difference between the numbers indicated at wide open and closed throttle positions should be '24' (24/64" pump stroke) Adjust by bending horizontal portion of pump lifter link

Pump stroke is adjustable for high or low temperature Set to longest stroke (outer hole) for cold weather, shorter stroke (inner hole) for hot weather driving

INTERNATIONAL TRUCK 1941-1949

BBR1—Down-Draft Carbureter—**Model 700S** (International No. 61776-R92)

(May be used with or without sandwich velocity governor, using standard flange gasket 1A-41.)

CARBURETER SPECIFICATIONS

For 6 Cylinder Engine, Model GRD 214—3-5/16" Bore; 4 1/8" Stroke (Truck Models K-1, K-2, K-3, K-4, KB-1, KB-2, KB-3, KB-4)

For 6 Cylinder Engine, Model GRD 233—3-5/16" Bore; 4 1/2" Stroke (Truck Models K-5, KB-5)

Dimensions: Flange size, 1 1/4 inch S. A. E.
Throttle bore, 1-9/16 inch (39.69 mm).
Main venturi, 1 1/4 inch (31.75 mm).

Float Setting: Top of float 5/64 inch (1.98 mm) plus or minus 1/64 inch (.397 mm) below top surface of carbureter body casting.

Vents: Outside, none. Inside, balance vent .218 inch (5.54 mm) diameter.

Gasoline Intake Needle: Triangular, horizontal. No. 44 (2.18 mm) drill in needle seat.

Idle Orifice Tube: Jet size, .0275 inch (.70 mm). Idle passage air bleed (in body), size, .067 inch (1.70 mm). Idle restriction (in body) size .054-.055 inch (1.371-1.397 mm).

Idle Ports: Upper port, keyhole type; length, .160 inch (4.06 mm). Width, .030 inch (.76 mm); .045 inch (1.14 mm) diameter hole at top. Top of port located .118 to .122 (3.00 to 3.10 mm) above top edge of valve. Lower port size, .053 to .057 inch (1.35 to 1.45 mm) diameter. (For idle adjustment screw.)

Set Idle Adjustment Screw: 1/2 to 1 1/2 turns open. For richer mixture, turn screw out. Do not idle engine below 400 r. p. m. or 6 m. p. h.

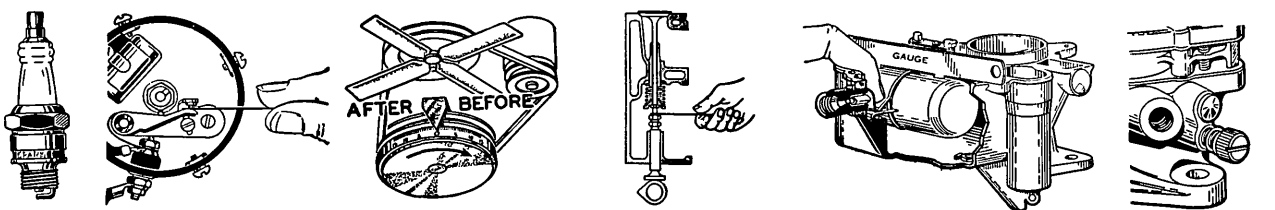
Main Metering Jet: Calibrated to flow 268 to 272 cc per minute.

Main Vent: Through diffuser (air bleed inside bowl) size, .0315 inch (.80 mm) drill.

Vent Tube: Side holes: 1—.0354 (.90 mm) drill 11/32 inch (8.73 mm) from end.
1—.0354 (.90 mm) drill 1 inch (25.40 mm) from end.
1—.0354 (.90 mm) drill 1-11/32 inch (31.43 mm) from end.
2—.0354 (.90 mm) drill approximately 1 1/2 inch (38.10 mm) from end.
1—.024 (.61 mm) drill 1-41/64 inch (41.67 mm) from end.

Step-Up Jet: .035 inch (.89 mm) drill.

Accelerating Pump: Type, delayed action. Stroke, summer setting (inner hole, short stroke). Winter setting (outer hole, long stroke). Pump intake passage, ball check seat, size .115 to .120 inch (2.93 to 3.05 mm) diameter.
Pump discharge passage: Restriction (under ball check) size .062 to .065 inch (1.58 to 1.65 mm) diameter in body.
Pump (discharge) jet, size .0276 inch (.70 mm) drill.



Pump Adjustment: 24/64 inch plunger travel; full throttle position, inner hole (short stroke). Use gauge No. T109-117S.

Choke: Offset butterfly type, with poppet valve.

Vacuum Spark Port: Slot type: size, .040 by .110 inch (1.016 by 2.794 mm). Bottom of port to be .003 to .009 inch (.076 to .229 mm) above top edge of valve.

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap	Breaker Point Setting	Ignition Timing Breaker Points to Open: 4° B. T. D. C. 26° Total Advance	Valve Setting	Float Setting (Use Gauge)	Idle Adjustment Screw Setting
.028"-.032"	.018"-.024"		(Hot) Int. & Exh. .017" (Cold) Int. & Exh. .020"	5/64 Inch	1/2 to 1 1/2 Turns Open

CARBURETER ADJUSTMENTS

For most satisfactory starting during extremely cold weather, pull out choke, crack throttle about one half open and then engage starter.

If carbureter loads up after considerable service, check float level. Wear on lip of float lever will raise float level. Before adjusting float, be sure float lever pin is firmly seated. Reset by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level. Bend vertical lip of float only.

If motor stalls while idling, set throttle lever adjusting screw so motor runs approximately 400 r. p. m. Then set idle adjustment screw to specifications. If these adjustments

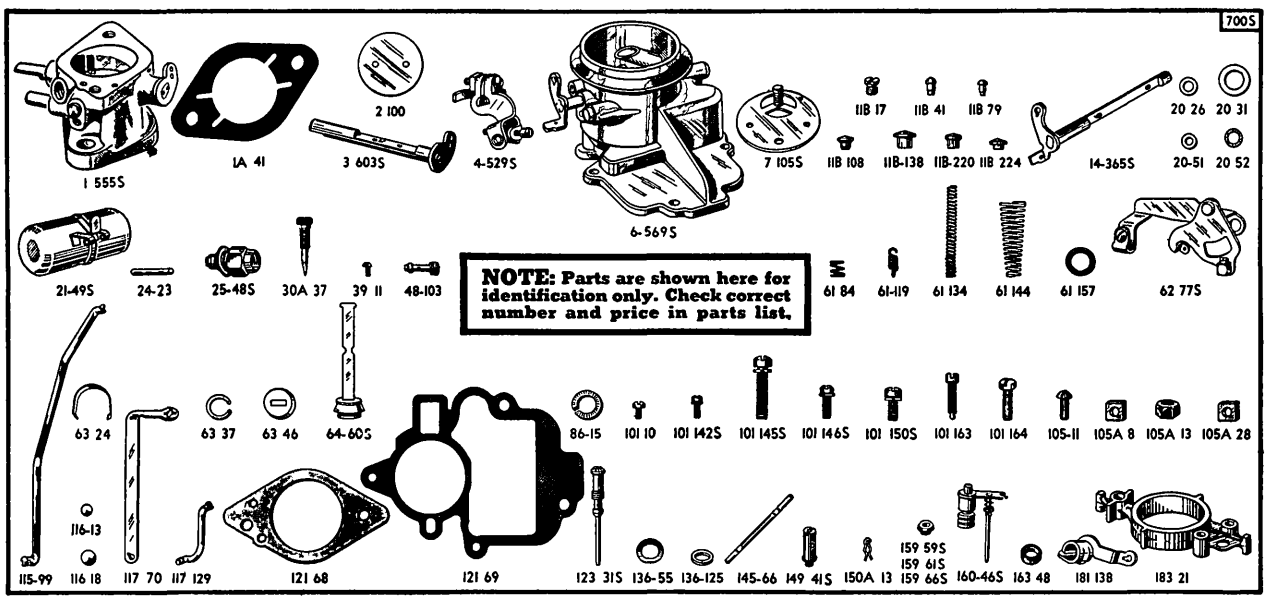
CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.

do not correct the trouble, remove idle orifice tube and plug assembly and clean tube and passages with compressed air



If acceleration is not satisfactory, remove pump jet and clean with compressed air, however, it is usually advisable to replace the pump jet, as its cost is nominal All jets must be seated gasoline tight Poor acceleration may be due to damaged or worn plunger leather in accelerating pump sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage If plunger is removed from cylinder use care in installing to avoid damage to plunger leather

Correct air fuel ratio is provided by a balance tube located in the air horn The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner Should the cleaner become clogged the capacity will be reduced but the air-fuel mixture ratio will not be changed

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with tool No T109-43, main vent tube can be removed and a new tube inserted with tool No T109-195 Care must be exercised in inserting new tube which must seat tightly Use new rivet to complete the installation

PUMP ADJUSTMENT: Remove air horn assembly, back out throttle lever adjustment screw and install pump operating link in inner hole (short stroke) of throttle shaft arm Place base of pump travel gauge T109-117S on upper edge of body casting at pump cylinder With throttle valve seated, turn gauge until projecting finger contacts top of plunger shaft Note number indicated on gauge Repeat with throttle valve wide open and plunger pressed to bottom of the cylinder The difference between the numbers indicated at wide open and closed throttle positions should be "24", (24/64" pump stroke) Adjust by bending horizontal portion of pump lifter link

Pump stroke is adjustable for high or low temperature Set to longest stroke (outer hole) for cold weather, shorter stroke (inner hole) for hot weather driving

damaged or worn plunger leather in accelerating pump, sediment in pump cylinder or clogged ball check at bottom of pump cylinder and discharge ball check in discharge passage If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather

Correct air fuel ratio is provided by a balance tube ' located in the air horn The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type size or condition of air cleaner Should the cleaner become clogged the capacity will be reduced but the air fuel mixture ratio will not be changed

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube After removal of main metering screw assembly beneath float bowl main vent tube can be removed and a new tube inserted with tool T109-195 Care must be exercised in inserting new tube which must seat tightly

Pump Adjustment Remove air horn assembly, back out throttle lever adjustment screw and install pump operating link in inner hole (short stroke) of throttle shaft arm Place base of pump travel gauge T109-117S on upper edge of body casting at pump cylinder With throttle valve seated, turn gauge until projecting finger contacts top of plunger shaft Note number indicated on gauge Repeat with throttle valve wide open and plunger pressed to bottom of the cylinder The difference between the numbers indicated at wide open and closed throttle positions should be "24", (24/64" pump stroke) Adjust by bending horizontal portion of pump lifter link Pump stroke is adjustable for high or low temperature Set to long stroke (outer hole) for cold weather, short stroke (inner hole) for hot weather driving

Main Metering Screw Adjustment Using a tachometer and with engine operating at normal temperature adjust throttle for an engine speed of approximately 2000 r p m Open main metering screw until engine operates smoothly with the highest vacuum gauge reading Slowly tighten main metering screw until a slight reduction of engine speed can be noticed or vacuum gauge shows slight decrease Open screw slightly from this position until maximum R P M and vacuum is obtained—usually not more than ⅛ to ¼ turn Hold screw securely and tighten nut to lock screw in position

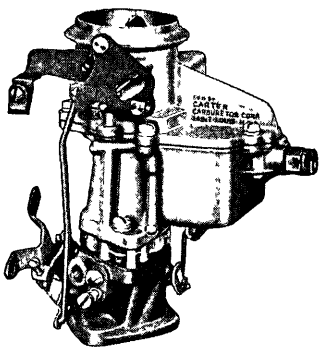
International Trucks—1941-49—Carbureters Nos. 656S-656SA

WHEN SERVICING, USE GASKET ASSORTMENT No 192, REPAIR PACKAGE No 1374B

PART NAMES IN CAPITAL LETTERS LISTED BELOW, INDICATE CONTENTS OF REPAIR PACKAGE

Part No	PART NAME	
1 555S	Body flange assembly	
1A 41	★FLANGE GASKET—FOR USE WITHOUT GOVERNOR	
1A-59	Flange gasket—for use with governor	
2-100	Throttle valve	
3 603S	Throttle shaft and arm assembly	
4 529S	Throttle lever assembly	
6 569S	Air horn assembly	
7 105S	Choke valve assembly	
11B 17	PUMP DISCHARGE PASSAGE PLUG	
11B 41	RIVET PASSAGE PLUG	
11B 79	Rivet passage plug	(2)
11B-108	RIVET PASSAGE PLUG	
11B 138	PUMP JET RIVET PLUG	
11B 224	Choke shaft rivet plug	
14-365S	Choke shaft and lever assembly	
20-26	Gasket	
20-31	Needle seat gasket	
20 32	Main metering screw gasket	
20-51	Step up jet gasket	
20 52	STEP-UP PISTON GASKET	
21-49S	Float and lever assembly	
24-23	FLOAT LEVER PIN	
25 48S	NEEDLE AND SEAT ASSEMBLY	
30A 37	Idle adjustment screw	
39-11	VALVE ATTACHING SCREW	(4)
48-103	PUMP JET	
61-84	Idle adjustment screw spring	
61-119	Choke pull back spring	
61-134	★STEP UP PISTON SPRING	
61-135	Step-up piston spring (Sup by 61 134)	
61-144	PUMP SPRING	
61-157	Plunger spring	
62 77S	Choke tube bracket assembly (Sup by 62 175S)	
62-175S	Choke tube bracket assembly	
63-24	FLOAT LEVER PIN RETAINER	
63-37	INTAKE BALL RETAINER RING	
63-46	SPRING RETAINER	
64-60S	PUMP PLUNGER AND ROD ASSEMBLY (Identify by shaft No 49-120)	

Part No	PART NAME	
86-15	Flange stud lock washer	(2)
101-10	Wire clamp screw	
101-142S	Choke bracket attaching screw and washer assembly	
101-145S	Flange attaching screw and washer assembly	(2)
101 146S	Bowl cover attaching screw and washer assembly (Sup by 101-150S)	
101 150S	Bowl cover attaching screw and washer assembly (long)	(4)
101-163	Throttle adjusting screw (Sup by 101-279)	
101-164	Throttle lever clamp screw	
101-279	Throttle adjusting screw	
105-11	Tube clamp screw	
105A-8	Choke tube clamp nut	
105A 13	Flange nut	(2)
105A 28	Clamp nut	
115 99	Fast idle rod	
116 13	PUMP INTAKE CHECK BALL	
116-18	PUMP DISCHARGE CHECK BALL	
117-70	PUMP LIFTER	
117-129	PUMP LINK	
121 68	BODY FLANGE GASKET	(2)
121-69	BODY GASKET	
123 31S	IDLE ORIFICE TUBE AND PLUG ASSEMBLY	
136 55	SPRING WASHER	
136-125	THROTTLE SHAFT SEAL RETAINER	(2)
145 66	MAIN VENT TUBE	
149 48S	STEP-UP JET ASSEMBLY	
150A 13	PIN SPRING	
159 88S	MAIN METERING JET ASSEMBLY	
159-123S	Adjustable main metering screw assembly	
160-46S	STEP-UP PISTON PLATE AND ROD ASSEMBLY	
163 10	Main metering screw packing	
163 48	Throttle shaft seal (Sup by 163 51)	(2)
163-51	THROTTLE SHAFT SEAL	(2)
181-138	Fast idle cam	
183-21	Insulator	



★To rebuild 656S to 656SA specifications use 1374B Repair Package containing 61 134 step-up spring 1A-41 flange gasket may then be used with or without governor

NOTE Figures in parentheses indicate number of pieces used in one carbureter Where no figure is shown, only one is used

(615SB and 615SC for use with sandwich velocity governor)

CARBURETER SPECIFICATIONS

For 6 Cylinder Engine, Model GRD 214—3-5/16" Bore; 4⅛" Stroke (Truck Models K-1, K-2, K-3, K-4, KB-1, KB-2, KB-3, K-B4)
For 6 Cylinder Engine, Model GRD 233—3-5/16" Bore; 4½" Stroke (Truck Models K-5, KB-5)

Dimensions: Flange size, 1¼ inch S. A. E.
Throttle bore, 1-9/16 inch (39.69 mm).
Main venturi, 1¼ inch (31.75 mm).

Float Setting: Top of float 5/64 inch (1.98 mm) plus or minus 1/64 inch (.397 mm) below top surface of carbureter body casting.

Vents: Outside, none. Inside, balance vent .218 inch (5.54 mm) diameter.

Gasoline Intake Needle: Triangular, horizontal. No. 44 (2.18 mm) drill in needle seat.

Idle Orifice Tube: Jet size, .0275 inch (.70 mm). Idle passage air bleed (in body), size, .067 inch (1.70 mm). Idle restriction (in body) size .054-.055 inch (1.371-1.397 mm).

Idle Ports: Upper port, keyhole type; length, .160 inch (4.06 mm). Width, .030 inch (.76 mm); .045 inch (1.14 mm) diameter hole at top. Top of port located .118 to .122 (3.00 to 3.10 mm) above top edge of valve. Lower port size, .053 to .057 inch (1.35 to 1.45 mm) diameter. (For idle adjustment screw.)

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture, turn screw out. Do not idle engine below 400 r. p. m. or 6 m. p. h.

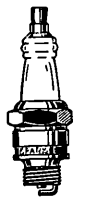
Main Metering Jet: 615S, 615SS, 615SA: Calibrated to flow 268 to 272 cc per minute. 615SB and 615SC calibrated to flow 282 to 286 cc per minute.

Main Vent: Through diffuser (air bleed inside bowl) size, .0315 inch (.80 mm) drill.

Vent Tube: Side holes: 1—.0354 (.90 mm) drill 11/32 inch (8.73 mm) from end.
1—.0354 (.90 mm) drill 1 inch (25.40 mm) from end.
1—.0354 (.90 mm) drill 1-11/32 inch (31.43 mm) from end.
2—.0354 (.90 mm) drill approximately 1½ inch (38.10 mm) from end.
1—.024 (.61 mm) drill 1-41/64 inch (41.67 mm) from end.

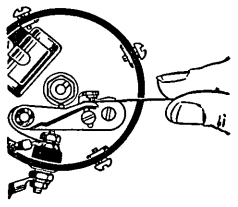
Step-up Jet: .035 inch (.89 mm) drill.

Accelerating Pump: Type, delayed action. Stroke, summer setting (inner hole, short stroke). Intermediate setting (center hole). Winter setting (outer hole, long stroke). Pump intake passage, ball check seat, size .115 to .120 inch (2.93 to 3.05 mm) diameter.
Pump discharge passage: Restriction (under ball check) size .062 to .065 inch (1.58 to 1.65 mm) diameter in body.
Pump (discharge) jet, size .0276 inch (.70 mm) drill.



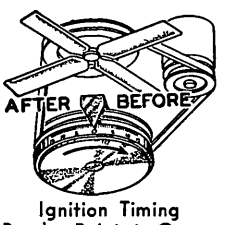
Pump Adjustment: 24/64 inch plunger travel; full throttle position, center hole (medium stroke 615S, 615SS, 615SB), inner hole (short stroke 615SA, 615SC). Use gauge No. T109-117S.

Choke: Offset butterfly type, with poppet valve.

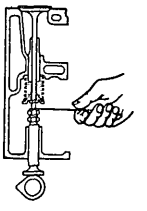


Vacuum Spark Port: Slot type: size, .040 by .110 inch (1.016 by 2.794 mm). Bottom of port to be .003 to .009 inch (.076 to .229 mm) above top edge of valve.

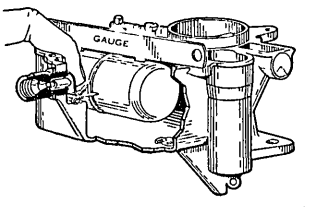
Motor Tune-Up—Be Accurate!



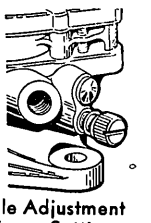
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .028"-.032"



Breaker Point Setting .018"-.024"



Ignition Timing Breaker Points to Open: 4° B. T. D. C. 26° Total Advance

Valve Setting (Hot) Int. & Exh. .017" (Cold) Int. & Exh. .020"

Float Setting (Use Gauge) 5/64 Inch

Idle Adjustment Screw Setting ½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

For most satisfactory starting during extremely cold weather, pull out choke, crack throttle about one half open and then engage starter.

If carbureter loads up after considerable service, check float level. Wear on lip of float lever will raise float level. Before adjusting float, be sure float lever pin is firmly seated. Reset by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level. Bend vertical lip of float only.

If motor stalls while idling, set throttle lever adjusting screw so motor runs approximately 400 r. p. m. Then set idle adjustment screw to specifications. If these adjustments

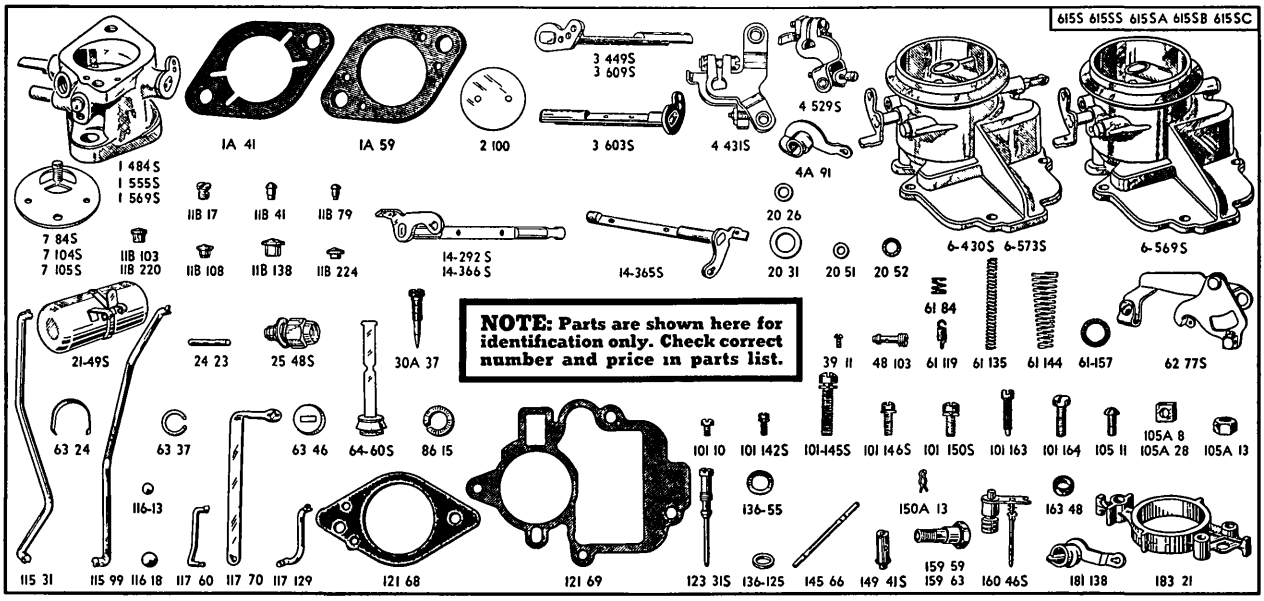
MARCA REGISTRADA

PRINTED IN U.S.A.

do not correct the trouble, remove idle orifice tube and plug assembly and clean tube and passages with compressed air



If acceleration is not satisfactory remove pump jet and clean with compressed air, however, it is usually advisable to replace the pump jet, as its cost is nominal All jets must be seated gasoline tight Poor acceleration may be due to damaged or worn plunger leather in accelerating pump, sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather

Correct air fuel ratio is provided by a "balance tube" located in the air horn The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner Should the cleaner become clogged, the capacity will be reduced but the air-fuel mixture ratio will not be changed

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with tool No T109-43, main vent tube can be removed and a new tube inserted with tool No T109-195 Care must be exercised in inserting new tube which must seat tightly Use new rivet to complete the installation

PUMP ADJUSTMENT· Remove air horn assembly, back out throttle lever adjustment screw and install pump operating link in center hole (medium stroke, 615S, 615SS, 615SB) and inner hole (short stroke, 615SA, 615SC) of throttle shaft arm Place base of pump travel gauge T109-117S on upper edge of body casting at pump cylinder With throttle valve seated, turn gauge until projecting finger contacts top of plunger shaft Note number indicated on gauge Repeat with throttle valve wide open and plunger pressed to bottom of the cylinder The difference between the numbers indicated at wide open and closed throttle positions should be "24", (24/64" pump stroke) Adjust by bending horizontal portion of pump lifter link

Pump stroke is adjustable for high or low temperature *Set to longest stroke (outer hole) for cold weather, shorter* stroke (inner hole) for hot weather driving

International Trucks 1941-48, Carb. Nos. 615S-615SS-615SB-615SA-615SC

KAISER
1954-1955

WCD Dual Down-Draft Climatic® Control **Carbureter No. 2146S**

CARBURETER SPECIFICATIONS

For Six Cylinder Engine: 3-5/16 Inch Bore, 4⅜ Inch Stroke

Dimensions: Flange size, 1¼ inch dual, 4 bolt type.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 19/32 inch I. D.
Main venturi, 1-3/16 inch I. D.

Float Level: See adjustments.

Vents: Inside, none. Outside, No. 35 (.110 inch) drill 2—holes.

Gasoline Intake: Size No. 42 (.0935 inch) drill in needle seat.

Low Speed Jet Tube: Jet, size No. 62 (.038 inch) drill.
By pass, in bowl cover, size No. 56 (.0465 inch) drill. Economizer, in bowl cover, size No. 63 (.037 inch) drill. Idle bleed, in bowl cover, size No. 55 (.052 inch) drill.

Idle Port: Upper, slot type, length .165 inch; width, .030 inch.

Idle Port Opening: Top of port .122-.128 inch above upper edge of valve with valve tightly closed.

Lower Port (For Idle Adjustment Screw): Size .0615 to .0655 inch diameter.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture turn screw out. Idle engine at 450 r.p.m. (Hydra-matic—in Drive Range), 500 r.p.m. (Standard and Overdrive Trans.).

Main Nozzle: Nozzle is installed permanently. DO NOT REMOVE.

Metering Rod (Vacumeter Type): Economy step .0735 inch diameter. Middle step tapers to .069 inch diameter. Power step .051 inch diameter.

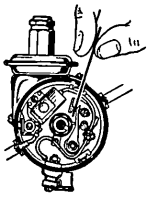
Main Metering Jet: .091 inch diameter.

Metering Rod Setting: See adjustments.

Accelerating Pump: Discharge jet (twin) size, No. 74 (.0225 inch) drill.
Intake disk check size, No. 30 (.1285 inch) drill.
Discharge (needle seat) size, No. 62 (.038 inch) drill.
Relief ball check size, No. 55 (.052 inch) drill.

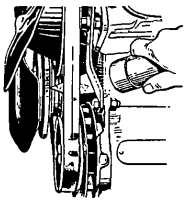
Pump Adjustment: See adjustments.

Choke: Carter Climatic® Control, set on index. Offset butterfly type. Bleed hole, size .156 inch diameter in valve. Choke heat suction hole, in bowl cover, size No. 32 (.116 inch) drill.

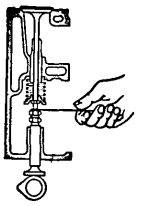


Vacuum Spark Port: .062 to .064 inch diameter. Top of port .052 to .056 inch above valve with valve tightly closed.

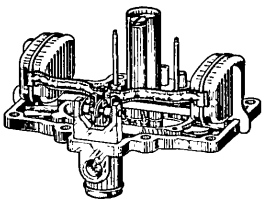
Motor Tune-Up—Be Accurate!



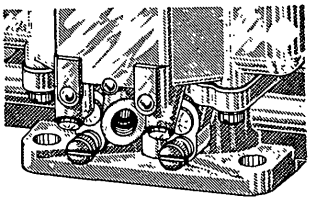
CAUTION. Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter



Spark Plug Gap .030"



Breaker Point Setting 1954—.022" 1955—.016"



Ignition Timing Breaker Points to Open: 4° B. T. D. C.

Valve Setting (Cold) Int. .014" Exh. .014"

Float Setting (See Adjustments)

Idle Adjustment Screw Setting ½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

Float Adjustment: Two separate float adjustments must be made—lateral and vertical. LATERAL ADJUSTMENT: With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge T109-162 directly under float with notched portions of gauge fitted over edges of casting. Sides of floats should barely touch the vertical uprights of float gauge. Adjustment should be made by bending arms of floats. VERTICAL ADJUSTMENT: With float gauge in same position floats should just clear the horizontal portion of gauge. (Vertical distance between top of float, and machined surface of casting must be 3/16 inch.) Adjust by bending float arms. Remove float, install bowl cover gasket and then reinstall float.

Pump Adjustment: Install pump connector link in lower hole (short stroke) of pump arm with ends extending toward countershaft arm. Back out throttle lever set screw until

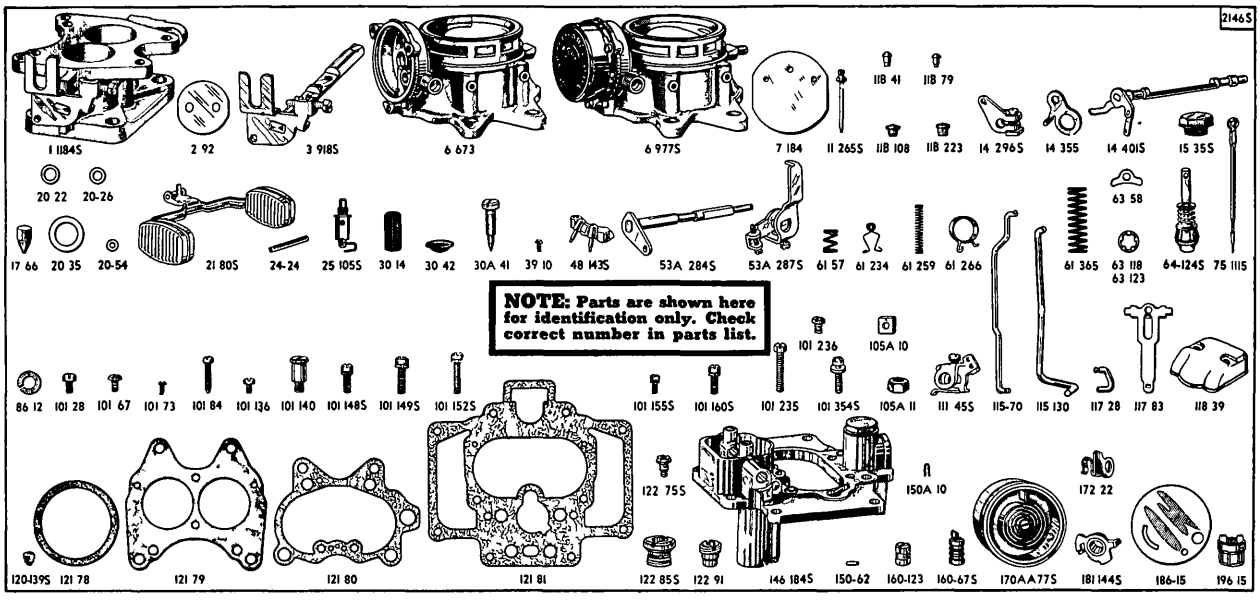
CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

S. S. PRINTED IN U.S.A.



throttle valves seat in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at lower angle (Use tool T109-213)

Metering Rod Adjustment With throttle valves seated in bores of carbureter, insert one metering rod gauge T109-163 in place of either metering rod Press down lightly on vacuum piston link until lug of piston link contacts lip of metering rod arm There should be less than 005" clearance between metering rod bearing and shoulder in notch of gauge Adjust by bending lip of metering rod arm (tool T109-105)

Fast Idle Adjustment· Loosen choke lever clamp screw on choke shaft Insert 040 inch feeler gauge T109-193 between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw.

With choke valve tightly closed, tighten fast idle adjusting screw until there is 026 inch (gauge T109-189) opening between throttle valve and bore of carbureter (side opposite idle port) Be sure fast idle adjusting screw is on high step of cam while making this adjustment

Unloader Adjustment With throttle wide open there should be 7/32 inch (gauge T109-106) clearance between upper edge of choke valve and inner wall of air horn Adjust by bending unloader lip on throttle shaft lever. Use bending tool (T109-41)

KAISER

DARRIN "161"

(Model K547)

1954

YF Down-Draft Carbureter—**No. 2094S**

CARBURETER SPECIFICATIONS

For Kaiser 6 Cylinder Engine: 3⅛ Inch Bore, 3½ Inch Stroke

Dimensions: Flange size, 1¼ inch S. A. E.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 11/16 inch I. D.
Main venturi, 1-5/16 inch I. D.

Float Setting: See adjustments.

Vents: Outside, none. Inside balance vent to air horn, above choke valve.

Gasoline Intake: Spring loaded needle. Size No. 48 (.076 inch) drill in needle seat.

Low Speed Jet Tube: Jet, size No. 70 (.028 inch) drill. By pass in air horn, size No. 57 (.043 inch) drill. Economizer size No. 55 (.052 inch) drill. Idle bleed, size No. 53 (.0595 inch) drill.

Idle Port: Upper port. slot type, length .159 to .161 inch; width .030 inch.

Idle Port Opening: Top of port .148 to .152 inch above top edge of valve with valve tightly closed.

Lower Port (For Idle Adjustment Screw): Size .0615 to .0655 inch diameter.

Set Idle Adjustment Screw: 1 to 2 turns open. For richer mixture turn screw out. Do not idle engine below 600 r.p.m.

Main Nozzle: Nozzle is installed permanently. DO NOT REMOVE. Anti-percolator well vent (plug), size No. 75 (.021 inch) drill.

Metering Rod (Diaphragm Type): Economy step .076 inch diameter; middle step tapers to .064 inch diameter; power step, .047 inch diameter.

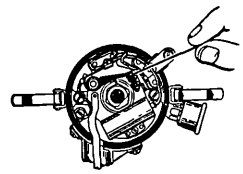
Metering Rod Jet: Size No. 40 (.098 inch) drill.

Metering Rod Setting: See adjustments.

Accelerating Pump: Diaphragm type, vacuum and mechanically operated. Pump jet, size No. 72 (.025 inch) drill. Intake passage (in diaphragm housing), size No. 75 (.021 inch) drill Discharge ball check seat (in body), size No. 42 (.0935 inch) drill. Vacuum restriction (in flange), size No. 55 (.052 inch) drill. Vacuum passage diaphragm bleed size No. 65 (.035 inch) drill.

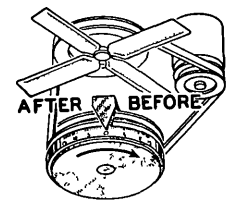
Pump Adjustment: None.

Choke: Manual, interconnected with throttle. Valve, offset butterfly type.

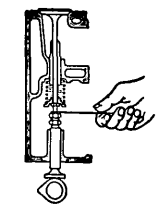


Vacuum Spark Port: .054 to .056 inch diameter. Top of port .035 to .045 inch above top edge of valve with valve tightly closed.

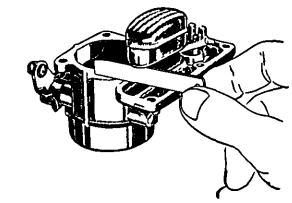
Motor Tune-Up—Be Accurate! Always Use Feeler Gauges!



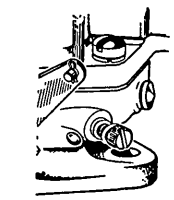
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter



Spark Plug Gap .030"



Breaker Point Setting .020"



Ignition Timing Breaker Points to Open: 5° B. T. D. C.

Valve Setting (Hot or Cold) Intake .018" Exhaust .016"

Float Setting See Adjustments

Idle Adjustment Screw Setting 1 to 2 Turns Open

CARBURETER ADJUSTMENTS

Float Adjustment: With bowl cover assembly inverted and float resting on pin in seated needle, and with gasket removed, the distance from the bowl cover to the top of float should be 9/32 inch (gauge T109-126). Do not depress float lip against spring loaded pin in needle, but let float rest of its own weight. Adjust by bending lip of float, not float arm. Float setting must be checked with the bowl cover held at eye height in a level position.

Metering Rod Adjustment: This adjustment is important and should be checked each time the carbureter is reassembled or lean rods are installed. With throttle valve seated in bore of carbureter, press down on upper end of diaphram shaft until diaphragm bottoms in vacuum chamber. (Tool T109-212 may be used to hold diaphragm shaft down while adjusting metering rod.) Metering rod should contact bottom of metering rod well and metering rod arm should contact lifter link at the outer end nearest the springs and at supporting lug. Adjust by bending lip of metering rod arm, to which metering rod is attached up or down.

Accelerating Pump: If acceleration is not satisfactory remove pump discharge ball check retainer ring and alumi

num pump discharge check ball Then remove pump diaphragm assembly Check diaphragm for wear or damage Be sure inlet hole in diaphragm housing is not clogged with lint or foreign matter Inspect and replace all worn or damaged parts and clean and blow out all passages with compressed air Make sure discharge ball check seats in casting as a leak at this point will result in poor acceleration

Fast Idle Adjustment. With choke held in wide open position, lip on fast idle arm should contact boss on body casting Adjust by bending at offset portion of choke connector rod

Kaiser—1954—Carbureter No. 2094S

PRINTED IN U.S.A.

METERING ROD ADJUSTMENT The metering rods must be adjusted after the pump adjustment or when leaner than standard rods are installed No metering rod gauges are necessary Procedure is as follows With the throttle lever set screw backed out and throttle valves seated in bores of carbureter, press down on vacumeter link until metering rods bottom With rods held in this position revolve meter ing rod arm until lip contacts vacumeter link Hold in place and carefully tighten metering rod arm set screw

FAST IDLE ADJUSTMENT With the thermostatic coil housing gasket and baffle plate removed crack throttle valve and hold choke valve closed Then close throttle There should now be 018"- 023" clearance (gauge T109-29) between throttle valve and bore of carbureter (side opposite idle port) Adjust by bending the choke connector rod at lower angle

UNLOADER ADJUSTMENT· Must be made after fast idle adjustment Hold throttle valve wide open and close choke valve as far as possible without forcing there should now be 9/64 inch (gauge T109-34) clearance between upper edge of choke valve and inner wall of air horn Adjust by bend- ing arm on choke trip lever

KAISER-FRAZER "HENRY J" 6 Cyl. 1951-1954

(833SB can be used in place of 814S-833S-833SA)

YF DOWN-DRAFT **CARBURETERS Nos. 814S-833S-833SA-833SB**

CARBURETER SPECIFICATIONS

For Kaiser-Frazer 6 Cylinder Engine: 3⅛ Inch Bore, 3½ Inch Stroke

Dimensions. Flange size 1¼ inch S A E
Primary venturi, 11/32 inch I D
Secondary venturi, 11/16 inch I D
Main venturi, 1¼ inch I D

Float Level: Distance from top of float (at free end) to float chamber cover when needle is seated 9/32 inch (Gauge No T109 126)

Vents: Outside none Inside balance vent to air horn above choke valve

Gasoline Intake: Square vertical (spring loaded) needle Size No 48 drill, in needle seat

Low Speed Jet Tube: Jet size No 70 (0 28 inch) drill By-pass in air horn, size No 56 (0465 inch) drill Idle bleed size No 56 (0465 inch) drill Economizer size No 58 (042 inch) drill (814S-833S 833SA and 833SB early production) size No 57 (043 inch) drill (833SB late production)

Idle Ports Upper port slot type length 169 171 inch Width 030 inch

Idle Port Opening: Top of port 126 to 130 inch above top edge of valve with valve tight closed Lower port size 0615 to 0655 inch diameter (for idle adjusting screw)

Set Idle Adjustment Screw 1 to 2 turns open For richer mixture turn screw out Do not idle engine below 550 r p m

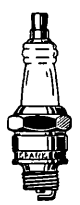
Main Nozzle Nozzle is installed permanently. **DO NOT REMOVE.**
Anti-percolator well vent (in body) size No 66 (033 inch) drill
Passage from anti-percolator well to nozzle restriction size No 70 (028 inch) drill

Metering Rod (Diaphragm Type): Economy step, 0715 inch diameter, middle step, tapers to 062 inch dameter; power step 045 inch diameter Length 2-13/32 inches

Metering Rod Jet: 0935 inch diameter

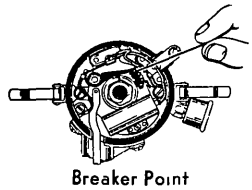
Metering Rod Setting See Adjustments

Accelerating Pump: Diaphragm type, vacuum operated (non adjustable)
Discharge (pump) jet size No 75 drill Needle seat (in discharge passage) size 092 inch diameter
Intake passage (in diaphragm housing) size No 72 drill
Vacuum restriction (in flange) size No 55 drill
Vacuum passage (diaphragm bleed) size No 65 drill



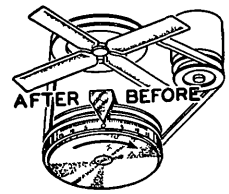
Pump Adjustment: None

Choke: Manual interconnected with throttle Valve offset butterfly type



Vacuum Spark Port: Slot type Size 125 by 040 inch Top of port 025 to 035 inch (814S) and 035 to 045 inch (833S-SA SB) above top edge of valve in closed position

Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

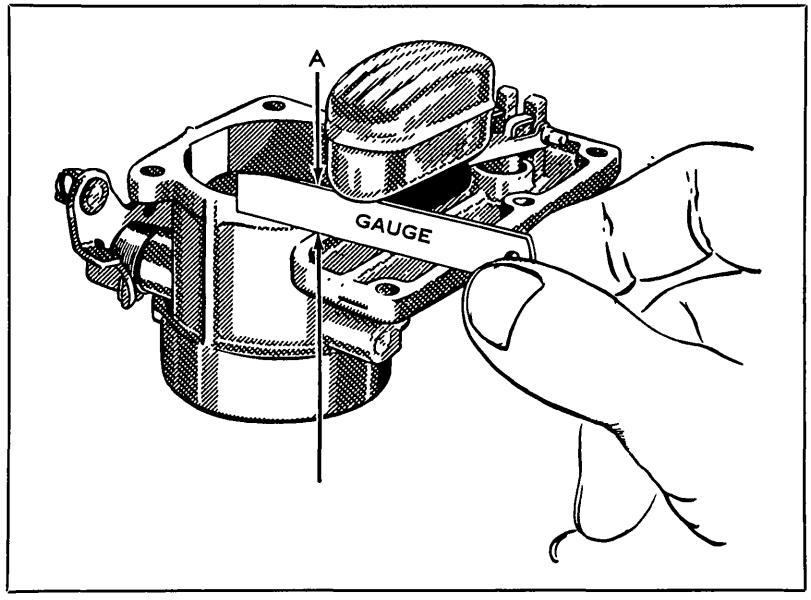

Figure 1
Float Adjustment

FLOAT ADJUSTMENT (Fig. 1):

With bowl cover assembly inverted and float resting on pin in seated needle, and with gasket removed, the distance (A) from the bowl cover to the top of float should be 9/32". (Gauge No. T109-126.) Do not depress float lip against spring loaded pin in needle, but let float rest of its own weight. Adjust by bending lip of float, not float arm.

Float setting must be checked with the bowl cover held at eye height in a level position.

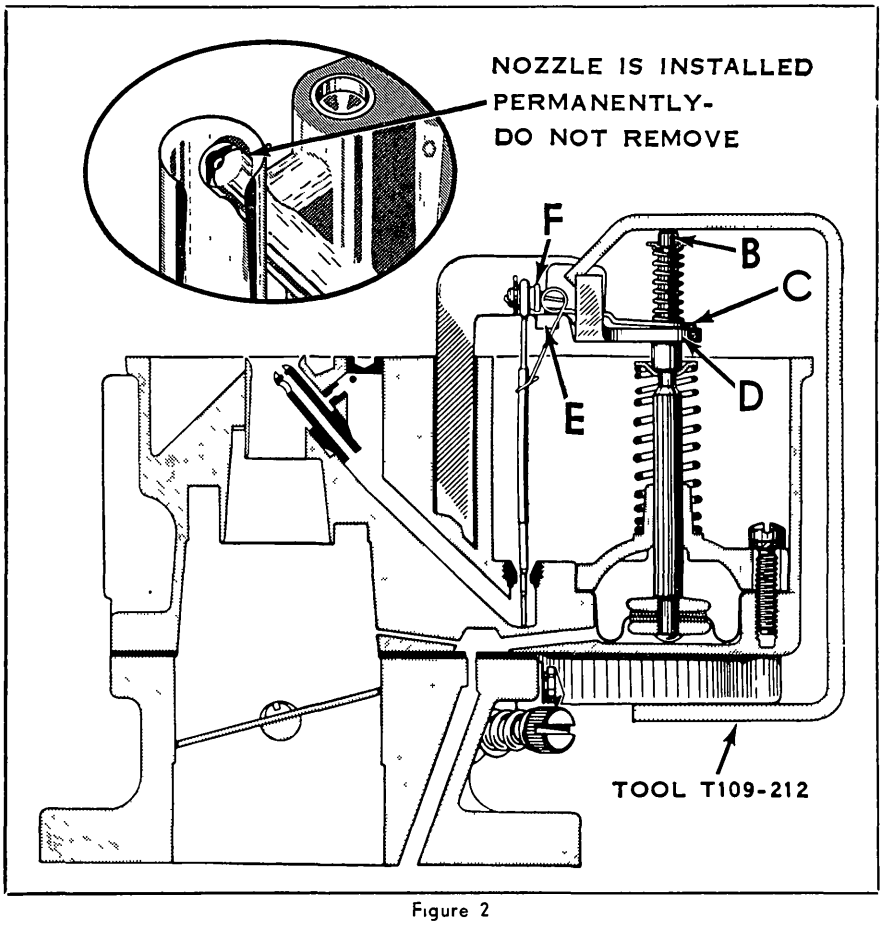

Figure 2
Metering Rod Adjustment

METERING ROD ADJUSTMENT (Fig. 2):

This adjustment is important and should be checked each time the carbureter is reassembled or lean rods are installed. With throttle valve seated in bore of carbureter press down on upper end of diaphragm shaft (B) until diaphragm bottoms in vacuum chamber (Tool T109-212 may be used to hold diaphragm shaft down while adjusting metering rod.)

Metering rod should contact bottom of metering rod well, and metering rod arm (C) should contact lifter link (D) between springs and at supporting lug (E). Adjust by bending lip (F) up or down

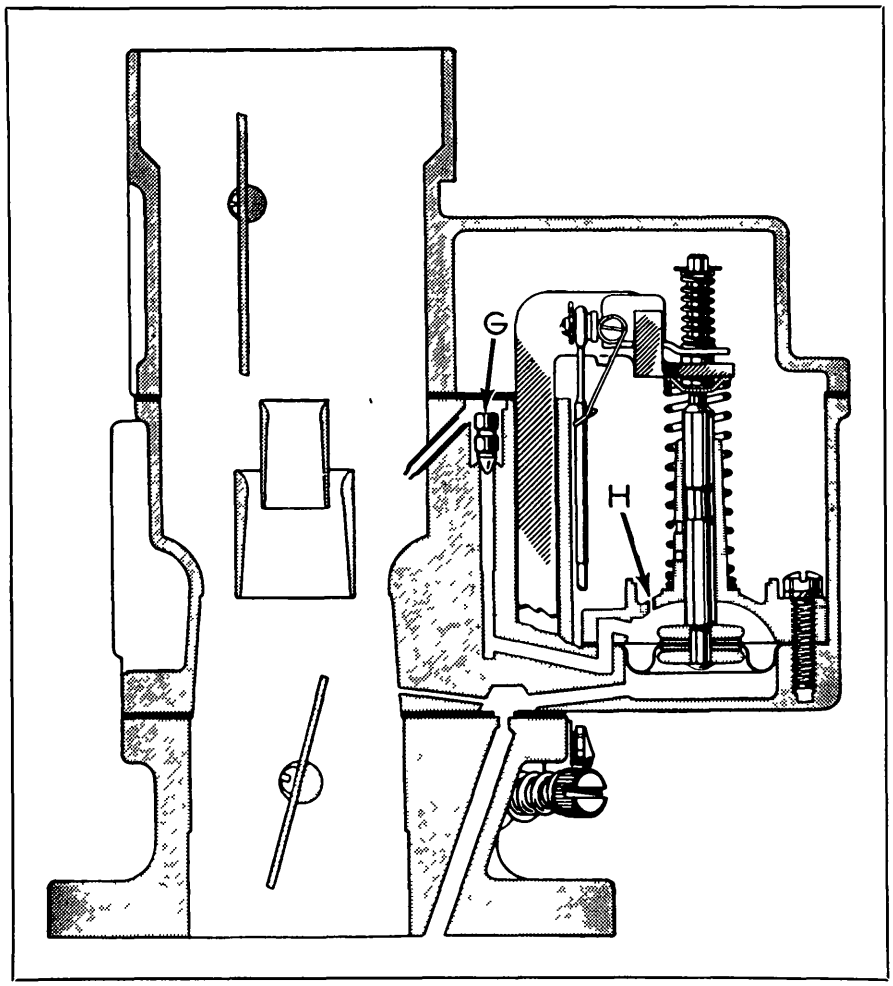

Figure 3
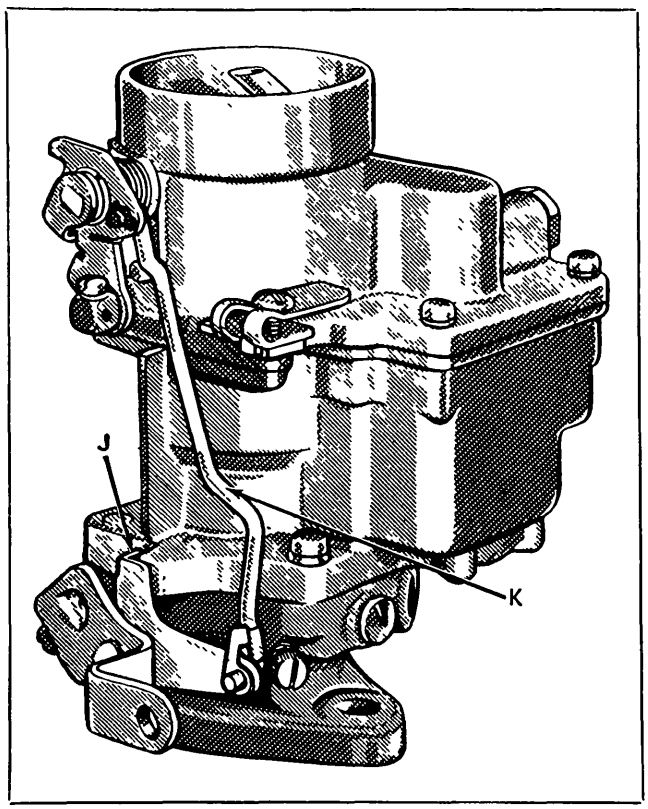
Accelerating Pump

ACCELERATING PUMP (Fig. 3):

If acceleration is not satisfactory, remove pump discharge check needle (G) and pump diaphragm assembly Examine needle and seat (in casting) and diaphragm for wear or damage Be sure inlet hole (H) is not clogged with lint or foreign matter Inspect and replace all worn or damaged parts, clean and blow out all passages with compressed air Pump discharge check needle (G) must seat, as a leak at this point will result in poor acceleration

FAST IDLE ADJUSTMENT (Fig. 4):

With choke held in wide open position, lip (J) on fast idle arm should contact boss on body casting Adjust by bending at offset (K) of fast idle link



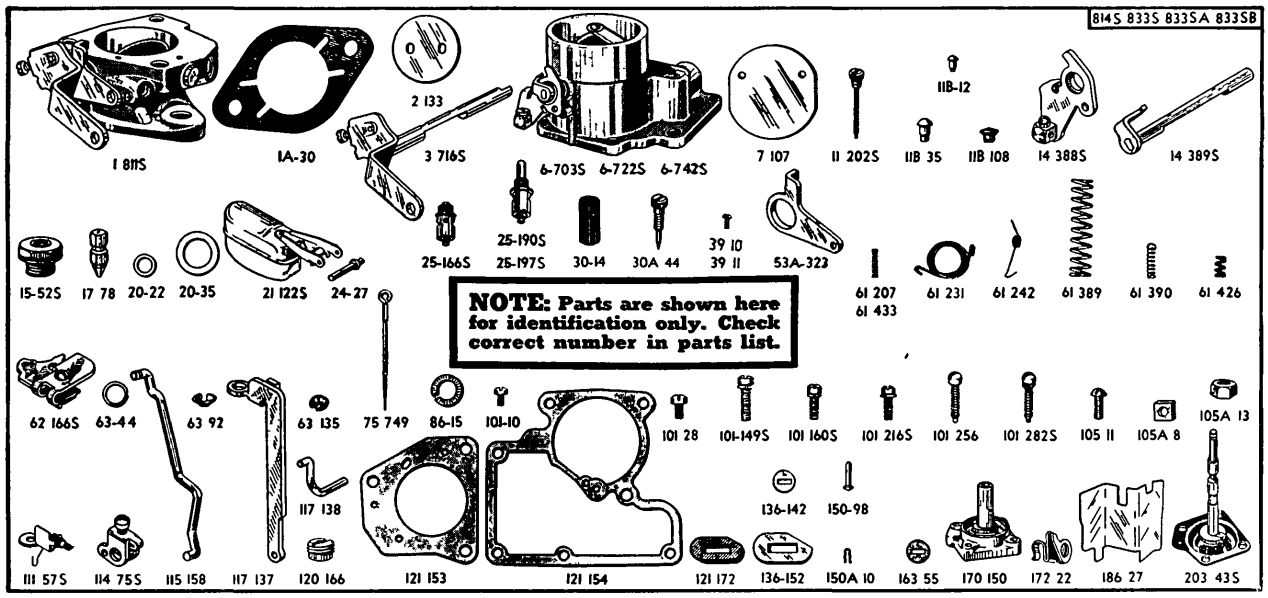


Figure 4
Fast Idle Adjustment

Kaiser-Frazer—1951-1954—Carbureters Nos. 814S-833S-833SA-833SB

WGD Dual Down-Draft Climatic® Control Carbureters—**Nos. 781S-813S**

CARBURETER SPECIFICATIONS

For 6 Cylinder Engine: 3-5/16 Inch Bore, 4 3/8 Inch Stroke

Dimensions: Flange size, 1 1/4 inch dual, 4 bolt type.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 21/32 inch I. D.
Main venturi, 1-1/16 inch I. D.

Float Level: Distance from float to bowl cover, when needle is seated to be 1/4 inch (gauge T109-31) when solid needle with needle pull clip is used; 7/64 inch (free weight of float on needle and spring) when spring loaded needle is used.

Vents: Outside: .156 inch diameter.
Inside: No. 32 drill (.116 inch diameter).

Gasoline Intake: Spring loaded needle (early production). Solid needle with needle pull clip (late production). No. 42 drill in needle seat.

Low Speed Jet Tube: Jet size No. 68 drill (.031 inch). By-pass, size No. 55 drill (.052 inch). Economizer, size No. 60 drill (.040 inch). Idle bleed, size No. 56 drill (.0465 inch).

Idle Ports: Upper port, length .187 inch. Width, .030 inch.

Idle Port Opening: .135 to .141 inch above upper edge of valve with valve closed tight.

Lower Port (For Idle Adjustment Screw): Size .0615 to .0655 inch diameter.

Set Idle Adjustment Screw: 1/2 to 1 turn open. For richer mixture turn screw out. Idle engine between 550-600 r.p.m.

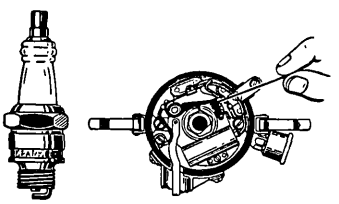
Main Nozzle: In primary venturi, closed tip, angle 47° from horizontal. Nozzle is installed permanently. Do not remove. Anti-percolating well; jet size, No. 71 drill.

Metering Rod (Vacumeter Type): Economy step .0695 inch diameter. Middle step tapers to .063 inch diameter. Power step, (781S) .052 inch diameter, (813S) .049 inch diameter, length 2-59/64 inches.

Metering Rod Jet: No. 44 (.086 inch) diameter.

Metering Rod Setting: After adjusting for pump stroke, set metering rod as follows: With throttle tightly closed, hold metering rods (assembled on vacumeter link) in maximum down position, tighten clamp screw securely with metering rod arm contacting vacumeter link.

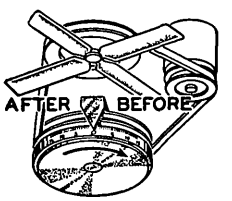
Accelerating Pump: Pressure type, delayed action plunger (non-adjustable lever). Discharge jet (twin) size, No. 74 drill (.0225 inch). Intake disk check size, No. 40 drill (.098 inch). Discharge (needle seat) size, No. 50 drill (.070 inch).



Pump Adjustment: See Adjustments.

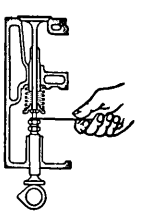
Choke: Carter Climatic® Control, set on index. Offset butterfly type. Choke heat suction hole, in bowl cover, No. 42 drill.

Vacuum Spark Port: .062 to .064 inch diameter. Top of port .033 to .038 inch above valve.

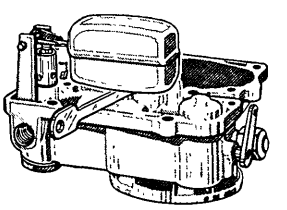


Motor Tune-Up—Be Accurate! Always Use Feeler Gauges!

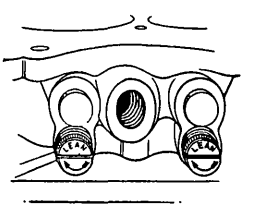
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .032"



Breaker Point Setting .022"



Ignition Timing Breaker Points to Open: 4° B.T.D.C.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT (Fig. 1):

With bowl cover gasket removed, bowl cover inverted and needle seated, there should be 1/4 inch (gauge T109-31) between top of float and bowl cover when solid needle with needle pull clip is used, or 7/64 inch between top of float and bowl (free weight of float resting on needle and spring) when spring loaded needle is used. Adjust by bending float arm

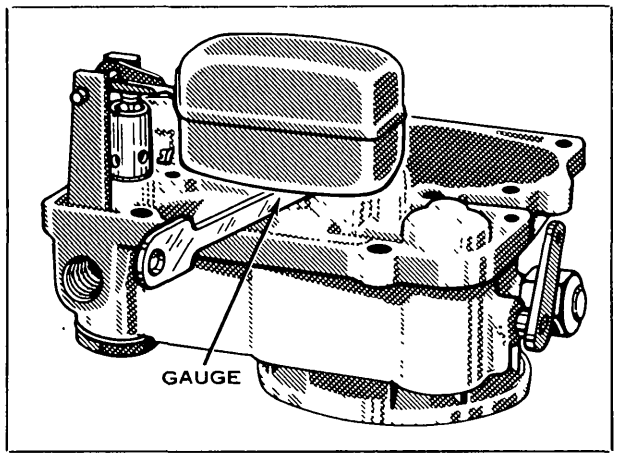

Figure 1
Float Adjustment

PUMP ADJUSTMENT (Fig. 2):

Back out throttle lever set screw until throttle valves seat in bores of carbureter. Place Universal pump travel gauge T109-117S inverted on edge of dust cover boss of bowl cover. Turn knurled nut of gauge until finger on gauge just touches top of plunger shaft (A).

The distance from the dust cover boss to the top of the plunger shaft should be 1/2 inch (distance from base to tip of finger on gauge) (C). Adjust by bending throttle connector rod at upper angle (B).

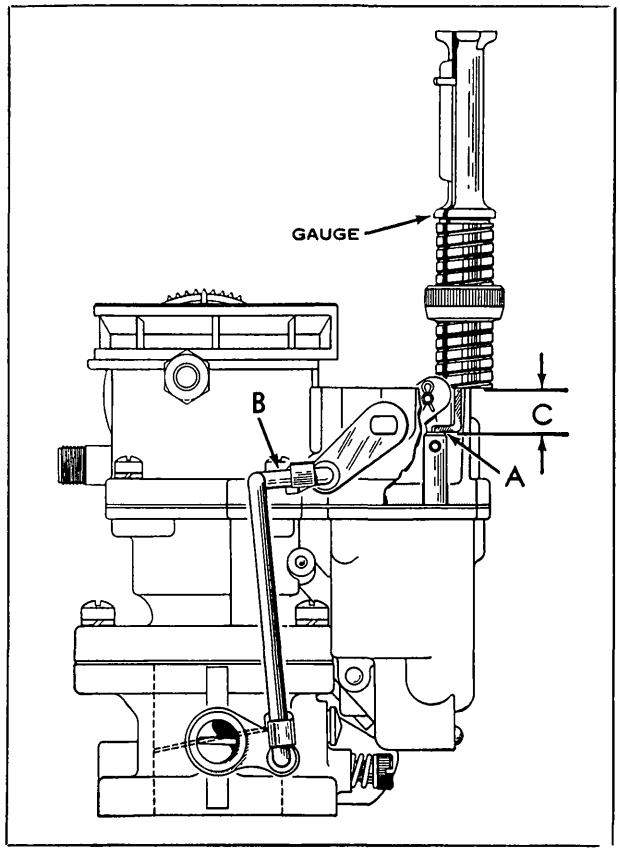

Figure 2
Pump Adjustment

METERING ROD ADJUSTMENT (Fig. 3):

The metering rods must be adjusted after the pump adjustment or when leaner than standard rods are installed. No metering rod gauges are necessary. Procedure is as follows. with the throttle lever set screw backed out and throttle valves seated in bores of carbureter, press down on vacumeter link (D) until metering rods bottom at (E). With rods held in this position, revolve metering rod arm (F) until lip contacts vacumeter link. Hold in place and carefully tighten metering rod arm set screw (G).

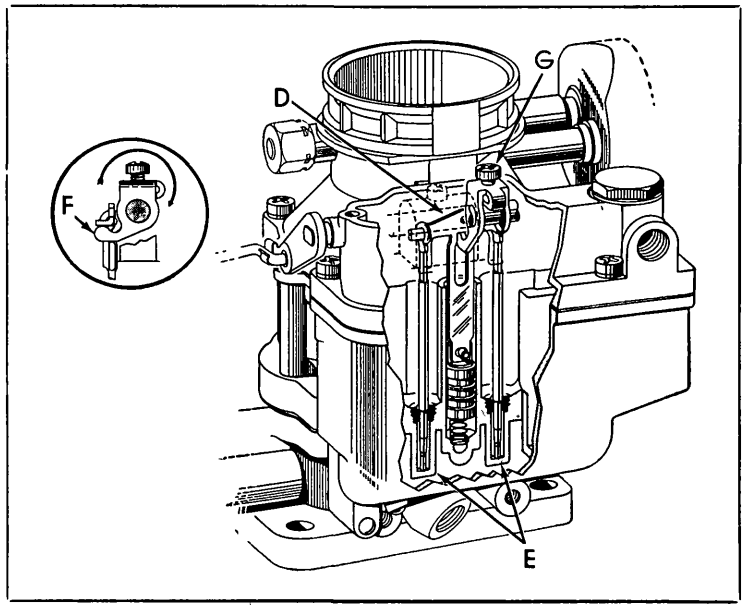

Figure 3
Metering R d Adjustment

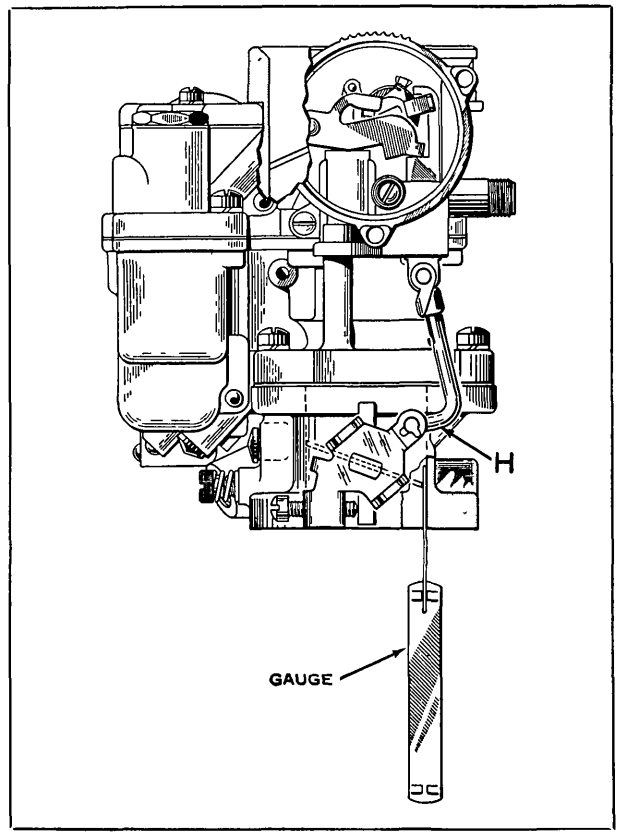

Figure 4
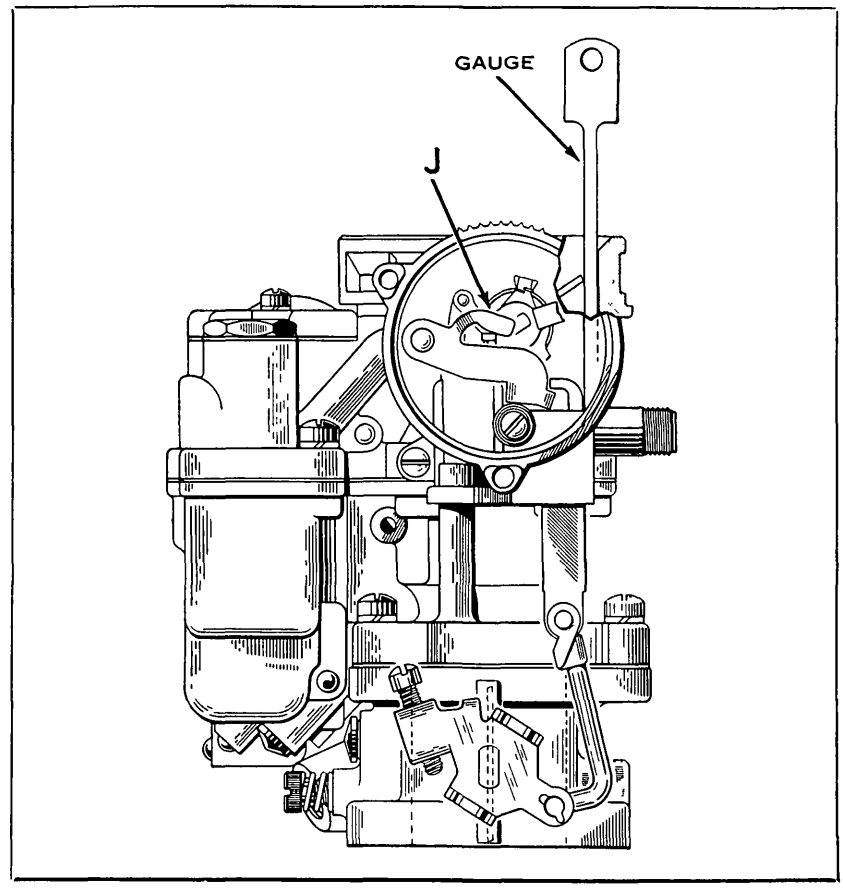
Fast Idle Adjustment

FAST IDLE ADJUSTMENT (Fig. 4):

With the thermostatic coil housing, gasket and baffle plate removed, crack throttle valve and hold choke valve closed. Then close throttle. There should now be .018"-.023" clearance (gauge T109-29) between throttle valve and bore of carbureter (side opposite idle port). Adjust by bending the choke connector rod at lower angle (H).

UNLOADER ADJUSTMENT (Fig. 5):

Must be made after fast idle adjustment. Hold throttle valve wide open and close choke valve as far as possible without forcing; there should now be 9/64 inch clearance between upper edge of choke valve and inner wall of air horn. Adjust by bending arm (J) on choke trip lever (tool T109-34).



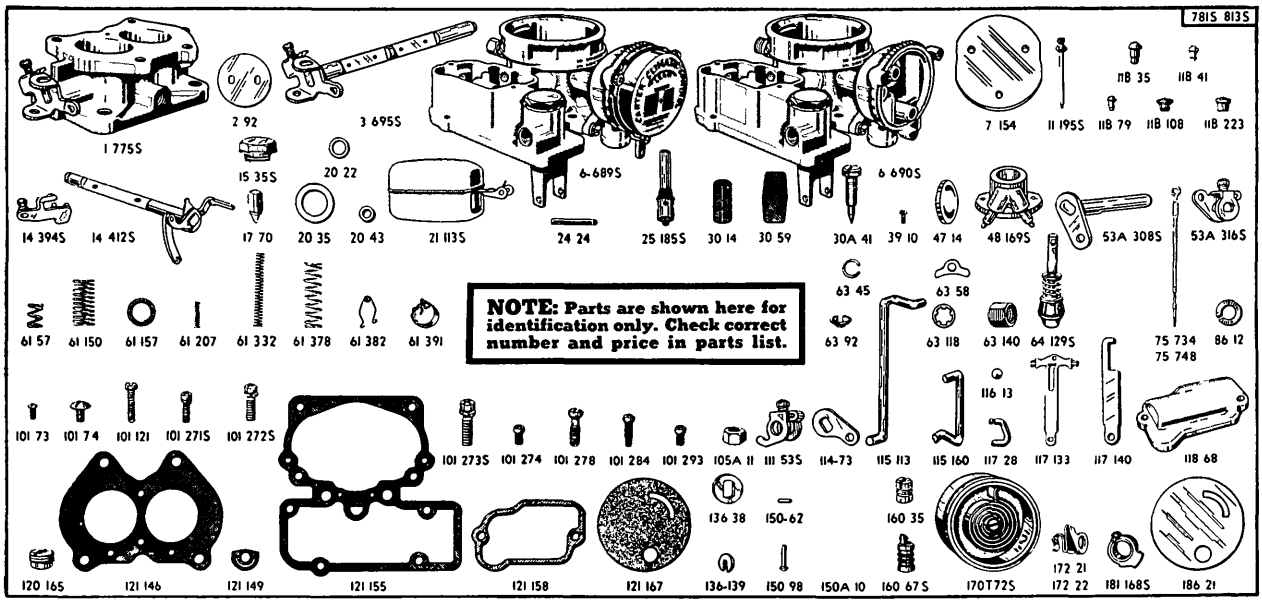


Figure 5
Unl ader Adjustment

Dimensions Flange size 1¼ inch dual 4 bolt type
Primary venturi 11/32 inch I D
Secondary venturi 19/32 inch I D
Main venturi 1 3/16 inch I D

Float Level Distance from seam of float (both sides—at top center) to lower edge of bowl cover when needle is seated (free weight of float on needle and spring) to be flush with casting to 1/32 inch

Gasoline Intake Square vertical (spring loaded) needle Size No 42 drill in needle seat

Vents Inside (tube) 123 inch inside diameter
Outside Size No 20 (161) inch drill hole

Low Speed Jet Tube Jet size No 66 drill (033) inch
By pass size No 56 drill (0465) inch
Economizer size No 63 drill (037) inch
Idle bleed size No 55 drill (052) inch

Idle Ports Upper port length 165 inch Width 030 inch

Idle Port Opening 122 to 128 inch above upper edge of valve with valve closed tight

Lower Port (For Idle Adjustment Screw) Size 0615 to 0655 inch diameter

Set Idle Adjustment Screw 1 to 1½ turns open For richer mixture turn screw out Do not attempt to idle engine below 8 m p h

Main Nozzle In primary venturi closed tip angle 49° from horizontal Nozzle is installed permanently **Do not remove**

Metering Rod (Vacumeter Type) Economy step 064 inch diameter tapers to power step 048 inch diameter Length 3 41/64 inch (This rod is designed with stabilizing flat on economy step)

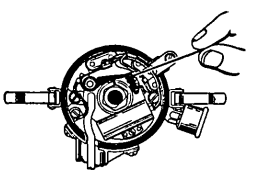
Metering Rod Jet 2 15 mm (0846 inch) diameter

Metering Rod Setting Use gauge part No T109 163 (2 940 inches)

Accelerating Pump Pressure type delayed action non adjustable lever
Discharge jet (twin) size No 74 drill (0225) inch
Intake disk check size No 30 drill (1285) inch
Discharge (needle seat) size No 55 drill (052) inch

Pump Adjustment 29 as indicated on gauge T109 117S with throttle valves seated or 17/64" from top of pump shaft to top of dust cover boss

Choke Carter Climatic® Control set on index Offset butterfly type valve Choke heat suction hole in bowl cover No 32 drill



Vacuum Spark Port 062 to 064 inch diameter Top of port 033 to 038 inch above valve

CARBURETER ADJUSTMENTS

Float Adjustment Two separate float adjustments must be made—lateral and vertical
(1) With bowl cover gasket removed, bowl cover inverted and held horizontal, at eye level, float should be flush to 1/32 inch from machined surface of bowl cover with float resting on float needle pin and spring
(2) Sides of floats must be at right angle to surface of bowl cover

Pump Adjustment The total distance the plunger head (not shaft) moves from closed to wide open throttle position controls the amount of fuel discharged Correct pump plunger travel is important and should be checked each time the carbureter is dis-assembled or when leaner than standard metering rods are installed Procedure is as follows
Install pump connector link in lower hole (short stroke) of pump arm, with ends extending towards countershaft arm

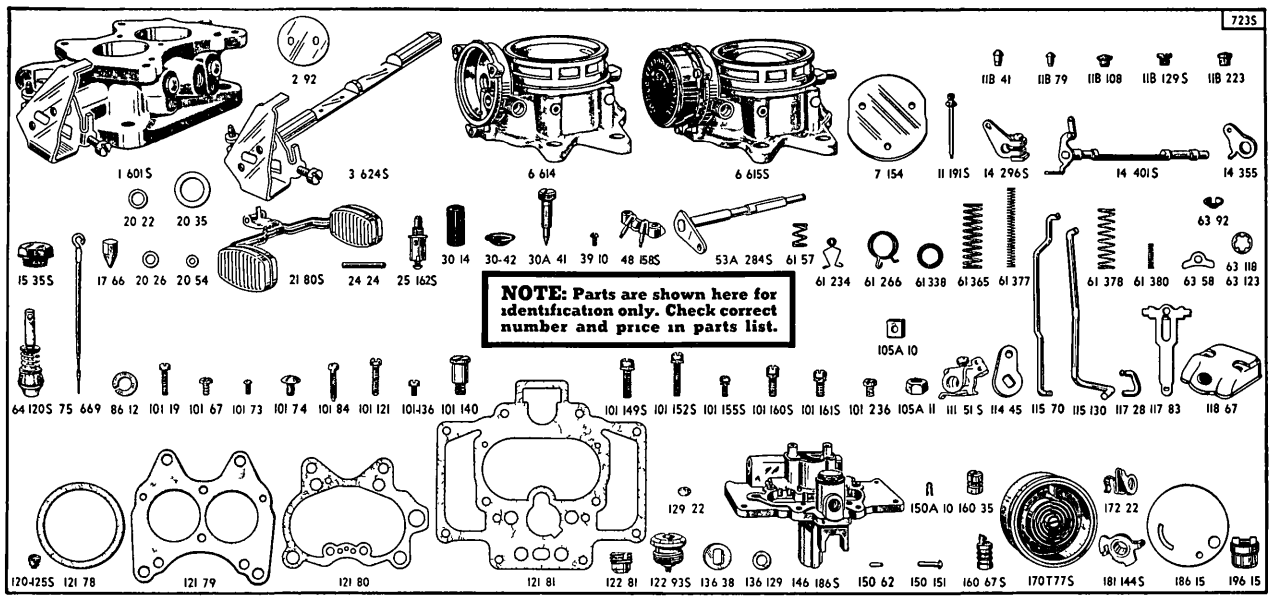
CARBURETER
TRADE MARK REG U S PAT OFF
MARCA REGISTRADA

PRINTED IN U S A

Back out throttle lever set screw until throttle valves seat in bores of carbureter Be sure fast idle adjusting screw does not hold throttle open Place universal pump travel gauge T109-117S inverted on edge of dust cover boss of bowl cover Turn knurled nut of gauge until finger just touches upper end of plunger shaft Number indicated on gauge should be "29" Hold the gauge vertical to insure correct reading

Adjust by bending the throttle connector rod at lower angle

Optional Adjustment With throttle valves seated in bores of carbureter, the distance from the top of the plunger shaft to the top of the dust cover boss should be 17/64"



Adjust as mentioned above

Metering Rod Adjustment: With throttle valves seated in bores of carbureter, insert one metering rod gauge T109-163 in place of either metering rod Press down lightly on vacuum piston link until lug of piston link contacts lip of metering rod arm There should be less than 005" clearance between metering rod bearing and shoulder in notch of gauge

Fast Idle Adjustment: Loosen choke lever clamp screw on choke shaft Insert 010" feeler gauge T109-200 between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position — hold in place and tighten clamp screw

With choke valve tightly closed, tighten fast idle adjusting screw until there is 018" opening between throttle valve and bore of carbureter (side opposite idle port) Use gauge T109-44 Be sure fast idle adjusting screw is on high step of cam while making this adjustment.

Unloader Adjustment: With throttle wide open there should be 1/8" clearance between upper edge of choke valve and inner wall of air horn (gauge T109-36) Adjust by bending unloader lip on throttle shaft lever (T109-41)

MOTOR NUMBERS

M1001 and higher

Casting No. 550 on Face of Flange

WCD Dual Down-Draft Climatic® Control Carbureter—**Models 685S-685SA**

CARBURETER SPECIFICATIONS

For 6 Cylinder Engine: 3-5/16 Inch Bore, 4⅜ Stroke

Dimensions: Flange size, 1¼ inch dual 4 bolt type
Primary venturi, 11/32 inch I D
Secondary venturi, 19/32 inch I D
Main venturi, 1-3/16 inch I D

Float Level: Distance from seam of float (both sides—at top center) to lower edge of bowl cover, when needle is seated (free weight of float on needle and spring) to be 9/64 inch (685S)*, 1/16 inch (685SA)* Use gauge No T109-160 (685S), No T109-197 (685SA)

Vents: Inside none Outside 2—size No 12 (.189) inch drill holes

Gasoline Intake: Square vertical (spring loaded) needle Size No 42 drill in needle seat

Low Speed Jet Tube: Jet size No 66 drill (.033) inch
By-pass, size No 56 drill (.0465) inch.
Economizer size No 63 drill (.037) inch
Idle bleed, size No 55 drill (.052) inch

Idle Ports: Upper port length .165 inch Width, .030 inch

Idle Port Opening: .122 to .128 inch above upper edge of valve with valve closed tight

Lower Port (For Idle Adjustment Screw): Size .0615 to .0655 inch diameter

Set Idle Adjustment Screw 1 to 1½ turns open For richer mixture turn screw out Do not attempt to idle engine below 8 m p h

Main Nozzle: In primary venturi, closed tip angle 49° from horizontal Nozzle is installed permanently **Do not remove.**

Metering Rod (Vacumeter Type): Economy step .0645 inch diameter Middle step tapers to .0545 inch diameter Power step .042 inch diameter Length 3 41/64 inches

Metering Rod Jet: 2.15 mm (.0846 inch) diameter

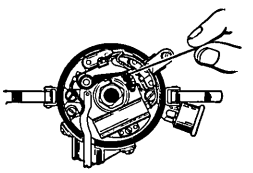
Metering Rod Setting: Use gauge part No T109 163 (2.940 inches)

Accelerating Pump: High pressure delayed action type Adjustable stroke
Discharge jet (twin) size No 74 drill (.0225) inch
Intake disk check size No 30 drill (.1285) inch
Discharge (needle seat) size No 55 drill (.052) inch

Pump Adjustment: "29" as indicated on gauge T109-117S with throttle valve seated and pump connector link in lower hole (short stroke)

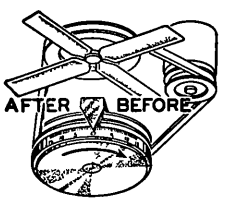
Choke: Carter Climatic® Control set on index Offset butterfly type Choke heat suction hole in bowl cover No 32 drill

Vacuum Spark Port: .062 to .064 inch diameter Top of port .033 to .038 inch above valve

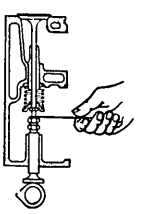


***NOTE:** 685S may be changed to 685SA by replacing 25-161S with 25-162S needle and seat assembly—resetting float level to 1/16 inch 25 161S may be identified by a copper plated spring (61 150) 25 162S may be identified by a copper oxide (black) plated spring

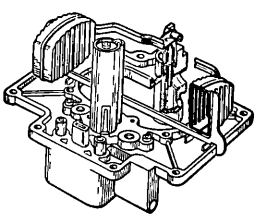
Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .032"



Breaker Point Setting .020"

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT (Fig 1) With bowl cover assembly in verted gasket removed and needle seated place gauge T109 160 (685S) T109 197 (685SA) between float and machined surface of casting By bending arm adjust floats to touch verti cal sides of gauge (A) and clear horizontal portion (B) Re move gauge and float install gasket then reinstall float

PUMP ADJUSTMENT (Fig 2) The accelerating pump has been designed to produce a uniform pump action The total dis tance the plunger head (not shaft) moves from closed to wide open throttle controls the amount of fuel discharged Correct pump plunger travel is important and should be checked each time the carbureter is disassembled Procedure is as follows Install pump connector link in lower hole (short stroke) with ends extending away from countershaft arm Back out throttle lever set screw to allow throttle valves to seat in bores of car bureter Be sure fast idle adjusting screw does not hold throt tle open Place pump travel gauge T109 117S inverted on edge of dust cover boss of bowl cover turn knurled nut of gauge until finger (C) just touches upper end of plunger shaft with throttle valves seated Number indicated on gauge should be 29 Hold gauge vertical to insure correct reading Adjust by bending throttle connector rod at lower angle (D)

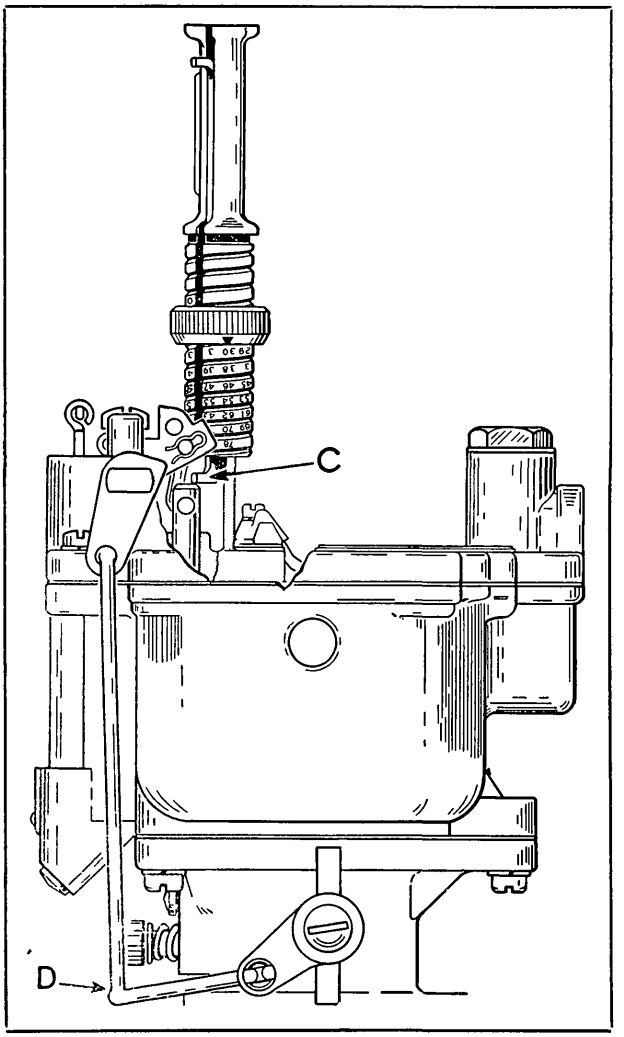

Figure 2

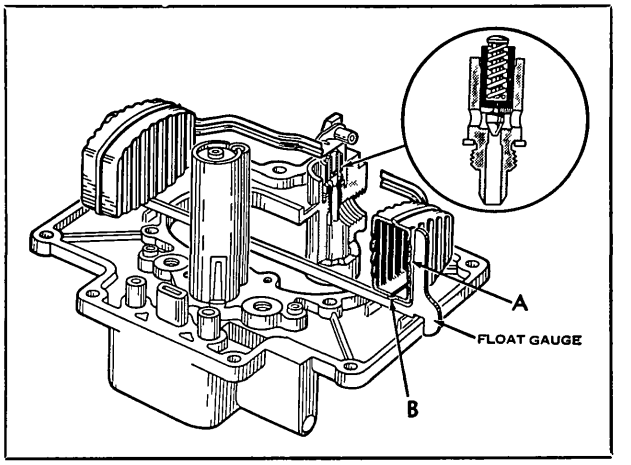

Figure 1

PUMP JET ADJUSTMENT (Fig 3) Good acceleration per formance at low speeds depends primarily on the gasoline dis charged from the pump jets Each of the two streams must be directed to its proper section of the dual venturi system In order to obtain maximum efficiency each stream must be di rected to a point between the primary and secondary venturi missing the outer wall of the primary venturi but striking the lower part of the inner wall of the secondary venturi

Only a slight bend should be necessary to aim the pump jets properly

METERING ROD ADJUSTMENT (Fig 4) Back out throttle lever adjusting screw until throttle valves seat in bores of car bureter Be sure fast idle adjusting screw does not hold throttle open Insert one metering rod gauge T109 163 in place of either metering rod Press down lightly on vacuum piston link (E) until lug of piston link (F) contacts lip (G) of metering rod arm There should be less than 005" clearance between metering rod bearing and shoulder in notch of gauge (H) Adjust by bending lip (G) of metering rod arm (Use tool T109 105 for bending)

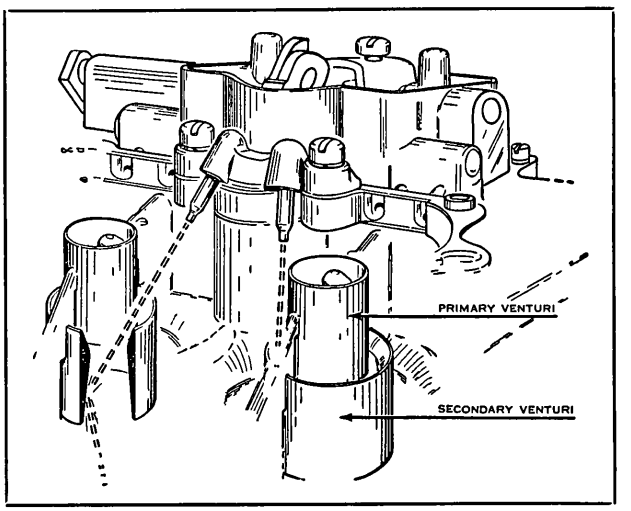

Figure 3

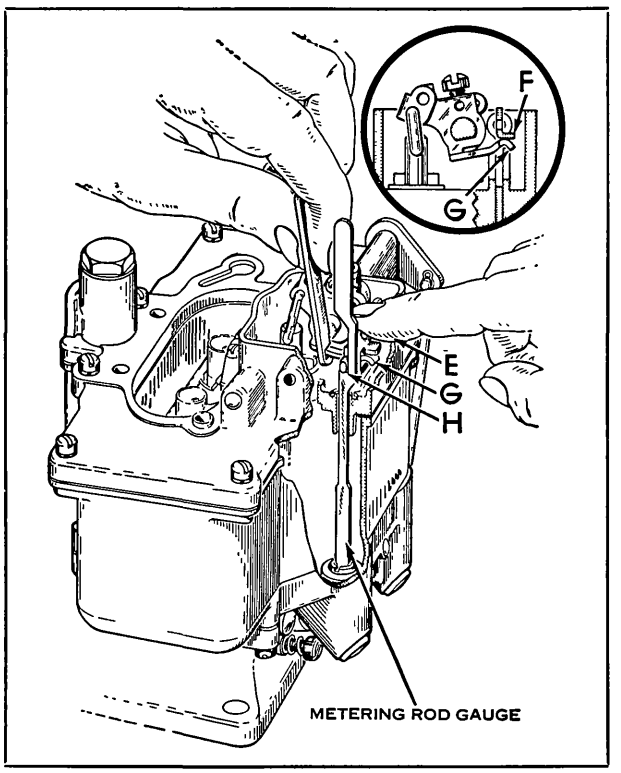

Figure 4

FAST IDLE ADJUSTMENT: (Fig. 5) With choke valve tightly closed, and throttle lever set screw backed out, adjust fast idle set screw (J) to just touch the high spot on the fast idle cam (L). From this position turn screw until there is .016" (K) between edge of throttle valve and bore of carbureter (side opposite idle port).

UNLOADER ADJUSTMENT: (Fig. 6) Loosen choke lever and screw assembly (M), on shaft. With choke valve tightly closed, insert .010" flat feeler gauge (N) between lip on fast idle cam and boss on flange casting, and tighten choke lever screw. Then with throttle valve wide open, adjust unloader lip (O) on throttle shaft lever to give 1/8" clearance (P) between upper edge of choke valve and inside wall of air horn (tool T109-36).

CHOKE ASSEMBLY: (Fig. 7) Correct assembly of the choke shaft, washers, choke valve and choke lever and screw assembly is important and must be done in the following way:

1. Install fiber washer (Q) on choke shaft before installing shaft in air horn.
2. With choke shaft and washer turned to closed position, and held tightly against air horn, install choke valve and tighten screws.

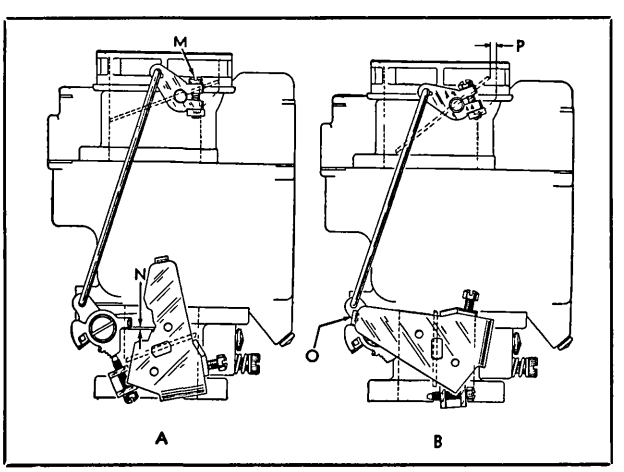

Figure 6

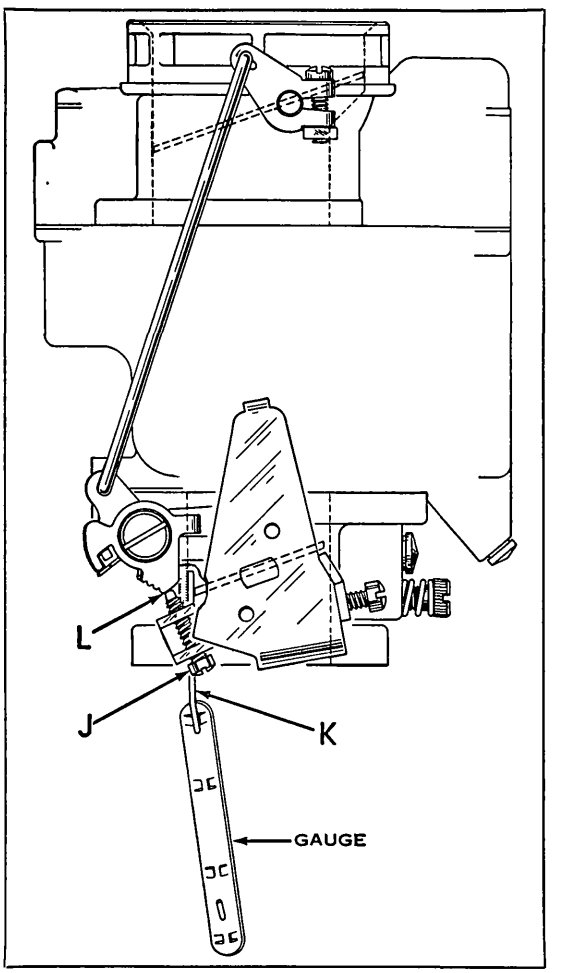

Figure 5

3. Then install fiber washer (R) and choke lever and screw assembly (S) on end of choke shaft where it extends through the air horn.
4. Place a .005" flat feeler gauge between washer and face of air horn.
5. Hold choke lever and screw assembly (S) against washer and tighten clamp screw (M).

It will be necessary to relocate the choke lever and screw assembly when making the unloader adjustment. Be sure there is .005" clearance between washer and air horn.

Choke must not drag or bind in any position.

FLANGE ASSEMBLY: Correct assembly of the flange is important and should be made in the following manner:

1. Install throttle shaft assembly and turn to closed position.
2. Press retaining ring (prongs extending away from casting) on throttle shaft so that it is against boss on casting and no endplay in shaft.
3. Install throttle valves with "C" toward the idle ports (viewed from manifold side of flange). Center valves by tapping lightly. Hold in place and tighten screws.

WA-1 Down-Draft **Carbureters 622S-622SA-622SB** With Climatic® Control

CARBURETER SPECIFICATIONS

For Six Cylinder Engine 3 5/16 Inch Bore 4 3/8 Inch Stroke

Dimensions Flange size 1¼ inch S A E
Primary venturi 11/32 inch I D
Secondary venturi 11/16 inch I D
Main venturi 1⅜ inch I D

Float Level Distance from seam of float (at free end) to tip on lower edge of float chamber cover when needle is seated to be ⅜ inch for 622S and ½ inch for 622SA SB

Movement of float at free end (float drop) to be ½ inch

Vents Outside No 10 drill Inside none

Gasoline Intake Square vertical needle Size No 38 drill hole in needle seat

Low Speed Jet Tube (622S 622SA) Jet size No 70 drill 028 inch (622SB) Jet size No 68 drill 031 inch
By pass size No 54 drill
Economizer 0755 0765 inch diameter
Idle bleed size No 50 drill

Idle Port Length 175 inch width 030 inch

Idle Port Opening 133 to 137 inch above edge of valve with valve closed tight

Idle Screw Seat No 46 drill

Set Idle Adjustment Screw ¾ to 1¾ turns open For richer mixture turn screw out Do not attempt to idle engine below 8 m p h (Slow idle free engine idle speed is between 525 and 555 r p m)

Main Nozzle In primary venturi angle 45° Closed tip Inside diameter No 30 drill Upper hole 021 inch diameter on 45° angle Lower hole 0945 inch d ameter on 70° angle

Metering Rod (Vacumeter Type) Economy step 075 inch diameter power step 055 inch diameter Length 3 9/64 inches

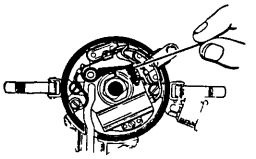
Metering Rod Jet 099 inch diameter

Metering Rod Setting Use gauge part No T109 102 (2 468 inches)

Accelerating Pump High pressure type with adjustable pump stroke
Pump discharge jet size No 67 drill
Relief passage (to outside) size No 42 drill
Intake ball check size No 55 drill
Discharge ball check size No 32 drill

Plunger Travel 18/64 inch plunger travel (full throttle position) Medium stroke Use gauge No T109 117S

Choke Carter Climatic® Control set on index Butterfly type offset valve Choke heat suction hole in body size No 35 (.110") drill



Vacuum Spark Port 051 to 054 inch d ameter (622S) Top of port 035 to 040 inch above top edge of valve (622SA SB) Top of port 033 to 043 inch (early production) 035 to 045 inch (late production) above top edge of valve

CARBURETER
TRADE MARK REG U S PAT OFF
MARCA REGISTRADA

PRINTED IN U S A

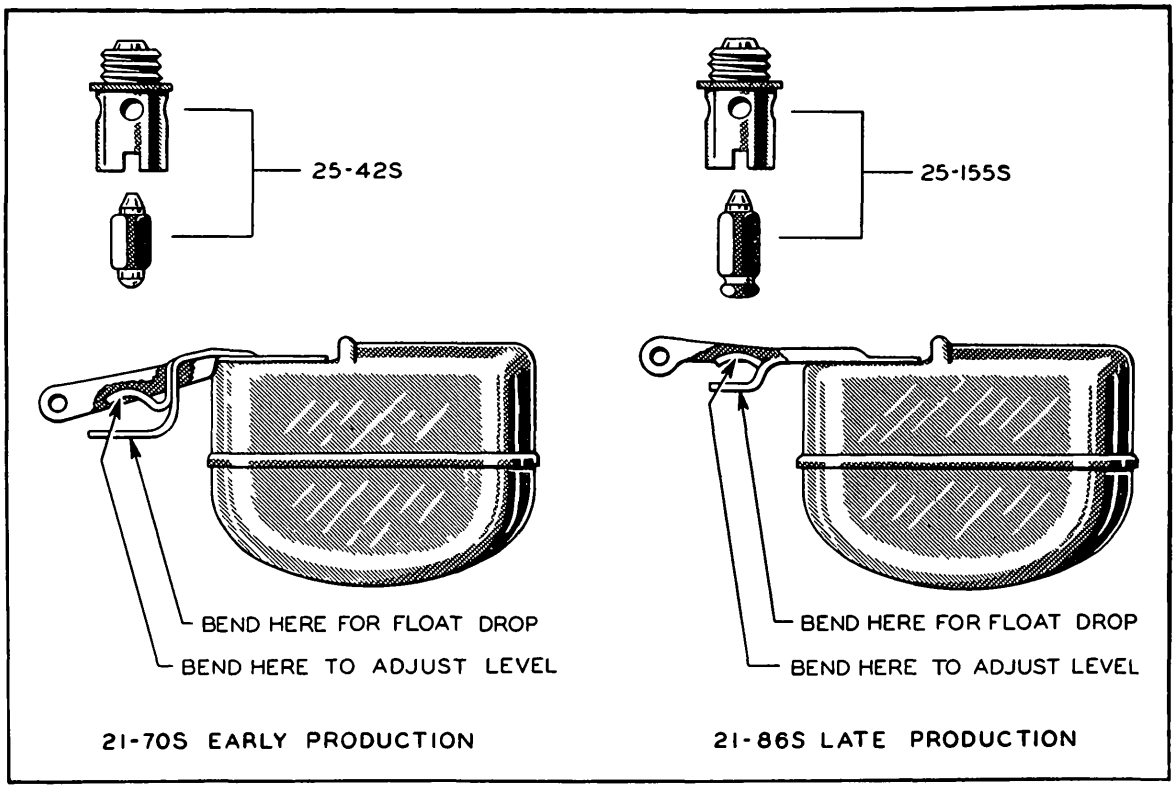

Figure 1

FLOAT LEVEL:

Early Production: 622S Carbureters use 21-70S float and lever assembly and must be used with 25-42S needle and seat assembly (Fig 1) Adjust float 3/8" from machined portion on bowl cover to seam of float (T109-80) (Fig. 2)

Late Production: 622SA Carbureters use 21-86S float and lever assembly and must be used with 25-155S needle and seat assembly (Fig. 1). Adjust float ½" from machined portion on bowl cover to seam of float (T109-83) (Fig 2)

To convert 622S to 622SA, unitized package 21-101U can be used (consists of 25-155S needle and seat assembly and 21-86S float and lever assembly).

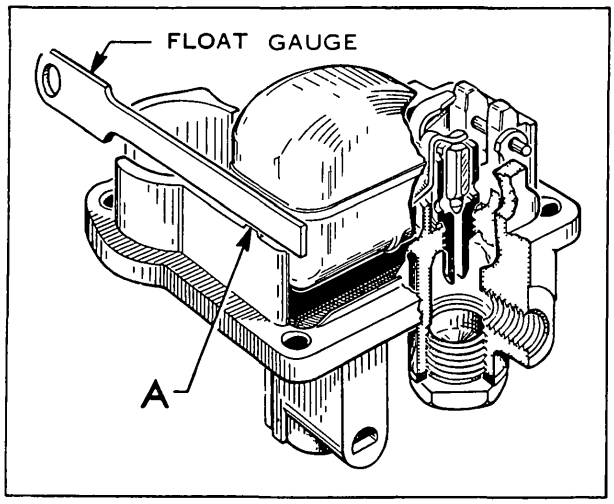

Figure 2

Pump Adjustment: Must be made before metering rod adjustment With throttle valve seated and pump connector link in lower hole (medium stroke), pump plunger should travel 18/64" from seated to wide open throttle position Pump travel can be measured by using universal pump stroke gauge, T109-117S, placing base of gauge on ridged portion of bowl cover so that finger of gauge is over top of pump connector link where it extends through plunger shaft, (B—Figure 3) Hold gauge vertical and turn knurled nut of gauge until finger lightly touches top of connector link Take gauge reading Difference in readings obtained at wide open and seated throttle positions should be "18"

Adjustment can be made by bending throttle connector rod at lower angle (Insert Figure 3)

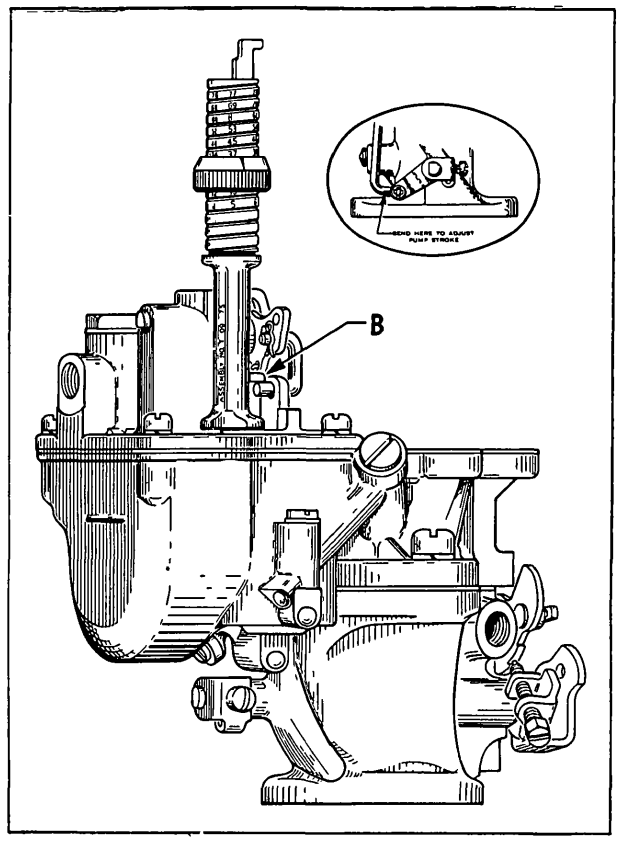

Figure 3

Metering Rod Adjustment: (Figure 4) Correct setting of metering rod is important and must be made after pump adjustment Procedure is as follows

1 Back out throttle lever set screw to seat throttle valve
2 Insert metering rod gauge T109-102 in place of metering rod seating tapered end in metering rod jet
3 Press lightly on vacuum piston link (C) until lip (D) contacts raised portion on pump operating lever There should be less than 005' between metering rod pin and shoulder in notch of gauge with throttle valve seated
4 Adjustment can be made by bending lip (D) on vacuum piston link
5 Remove gauge and install metering rod and disk Connect metering rod spring

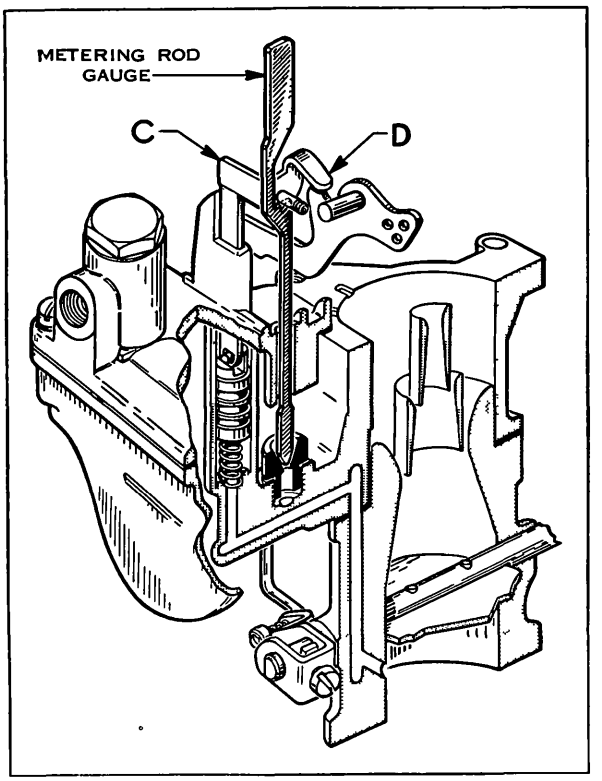

Figure 4

Anti-Percolator Adjustment: (Figure 5) Crack throttle valve 030' (E) by placing gauge T109-29 (F) between valve and bore of carbureter at side opposite port Bend rocker arm (Use tool T109-105) until there is a clearance of 005" to 015" between rocker arm and pump arm (G)

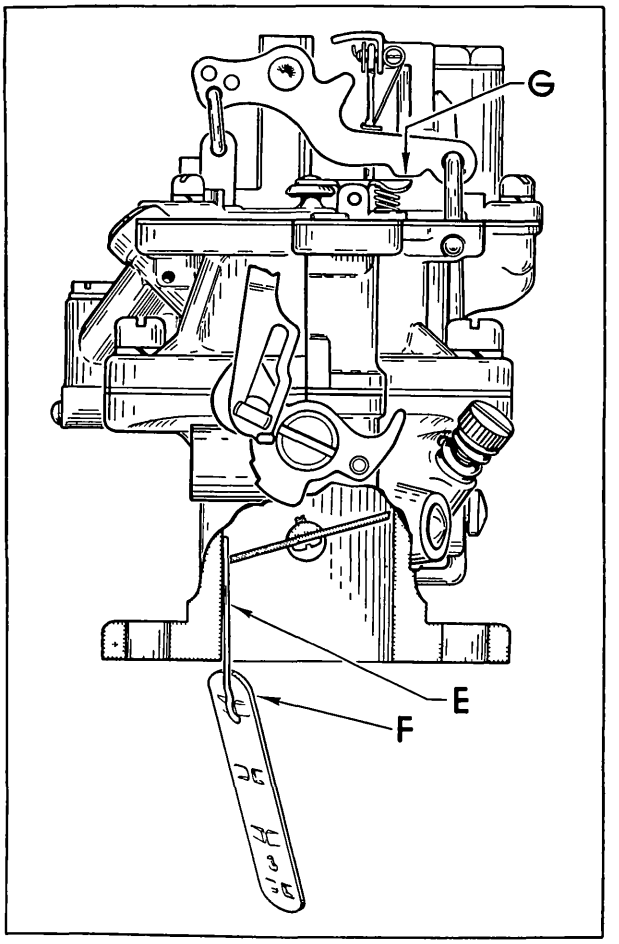

Figure 5

Fast Idle Adjustment: (Figure 6) With fast idle cam held in normal idle position tighten throttle lever adjusting screw until it just touches cam Hold throttle closed and pull cam back until first step on cam is against (not on) set screw (H)

There should now be 5/8' clearance (J) between inside wall of air horn and lower edge of choke valve Use tool T109-85

Adjustment can be made by bending at offset portion (K) of fast idle link Use tool T109-41

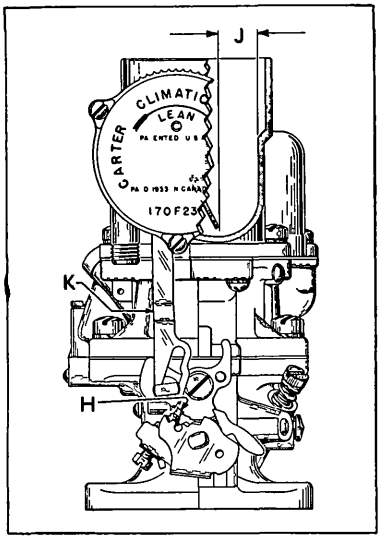

Figure 6

Unloader Adjustment: (Figure 7) With throttle valve wide open there should be 7/16" clearance (L) between lower edge of choke valve and inner wall of air horn Use gauge T109-81 Adjustment should be made by bending arm (M) on throttle lever using tool T109-41

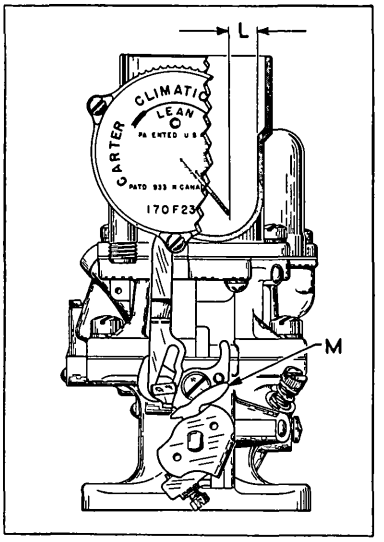

Figure 7

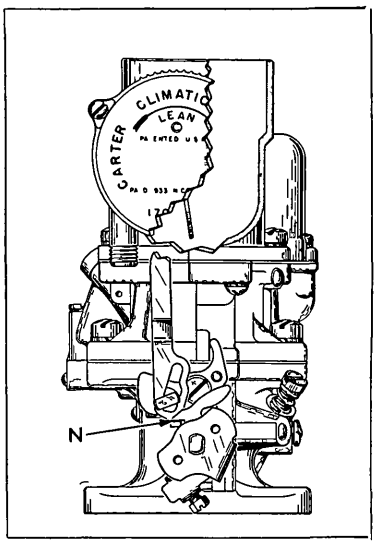
Lock-Out Adjustment: (Figure 8) With throttle and choke valves wide open, choke should lock in wide open position Adjustment should be made by bending lip at lower end of fast idle link (N) to give 1/32' clearance between lip and throttle lever lock



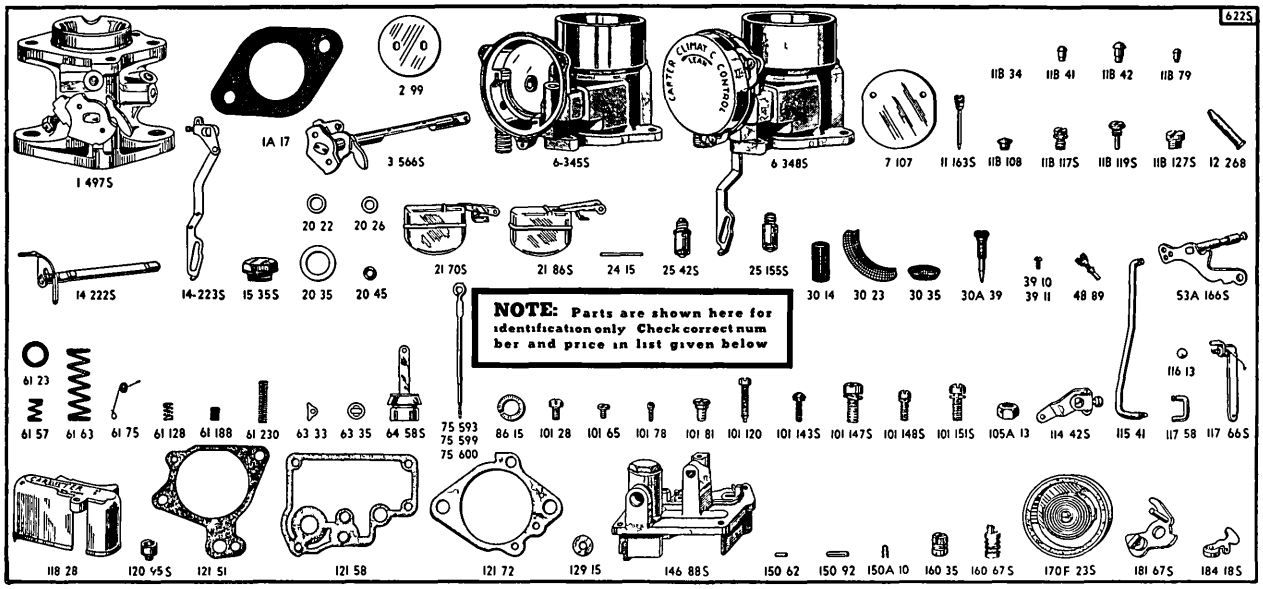


Figure 8

(LIMITED PRODUCTION)
(622SB can also be used)

W-1 DOWN-DRAFT **CARBURETER No. 574S**

CARBURETER SPECIFICATIONS

For Six Cylinder Engine: 3-5/16 Inch Bore, 4⅜ Inch Stroke

Dimensions: Flange size, 1¼ inch S. A. E.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 11/16 inch I. D.
Main venturi, 1¼ inch I. D.

Float Level: Distance from float (at free end) to float chamber cover, when needle is seated, to be ½ inch plus or minus 1/64 inch.

Vents: Outside, none. Inside balance vent tube above choke valve 13/64 inch I. D.

Gasoline Intake: Square vertical needle. Size No. 48 drill hole in needle seat.

Low Speed Jet Tube: Vertical jet size, .035 inch diameter.
By-pass in body, size No. 51 drill.
Economizer jet, size .0545 to .0555 inch diameter.

Idle Ports: Upper port diameter, No. 44 drill.
Lower port diameter, No. 54 drill.

Idle Port Opening: Top of lower port .044 to .048 inch above top edge of valve, with valve closed tight.

Idle Screw Seat: Size No. 52 drill.

Set Idle Adjustment Screw: 1¼ to 2¼ turns open. For richer mixture, turn screw out. Do not attempt to idle engine below 350 r. p. m.

Outer Nozzle: In primary venturi, angle 30°. Discharge size, .125 inch diameter.

Inner Nozzle: (Seats in outer nozzle) .120 inch I. D.

Nozzle Retainer Plug: Jet size No. 31 drill.

Metering Rod: Economy step .067 inch diameter. Second step tapers to .062 inch diameter. Third step tapers to .060 inch diameter. Power step .046 inch diameter. Length 3⅜ inches.

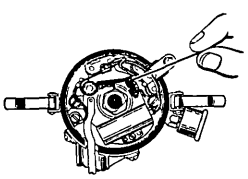
Metering Rod Jet: Size .093 inch diameter.

Metering Rod Setting: Use gauge, part No. T109-25 (2.795 inches).

Accelerating Pump: Low pressure type with non-adjustable stroke
Discharge jet, size No. 72 drill.
Intake disk check plug, size No. 62 drill.
Discharge disk check plug, size No. 40 drill

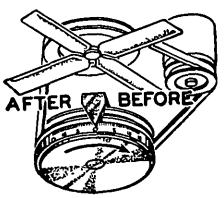
Choke: Manual—butterfly type, offset valve.

Throttle Valve: Opens to within 0° to 3° from perpendicular



Vacuum Spark Port: Slot type: size, .041 to .125 inch. Bottom of port .000 to .004 inch above top of valve.

Motor Tune-Up—Be Accurate! Always Use Feeler Gauges!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service, float level should be checked Wear on lip of float lever will raise float level Float level may be reset by bending lip of float lever down to raise float level or bending lever up to lower float level Only a very slight bend is needed

If motor stalls while idling reset idle adjustment screw and throttle lever adjusting screw If these adjustments do not correct the trouble, remove low speed jet tube and clean thoroughly with compressed air Examine and see that tube seats gasoline-tight in body casting, top and bottom If not replace with a new tube of identical specifications NEVER CHANGE A LOW SPEED JET TUBE FROM ONE CARBURETER TO ANOTHER

Increased resistance on foot throttle indicates a clogged pump jet Pump jet should be removed and cleaned with compressed air, which in many cases, will remove the dirt or lint However, it is usually advisable to replace the pump jet, as its cost is nominal All jets and ball checks must be seated gasoline-tight

Poor acceleration may be due to damaged or worn plunger leather in accelerating pump, corrosion in pump cylinder loose or cracked cylinder cracked plunger cup or bent pump arm (parts which may be replaced at small cost) If plunger is removed from cylinder always use loading tool in reassembling to avoid damage to plunger leather

Kaiser-Frazer—1947—Carbureter 574S

AFB Four-Bore Down-Draft Climatic® Control **Carbureter No. 2853S**

CARBURETER SPECIFICATIONS

For Lincoln 8 Cylinder 430 Cu. In. Engine: Vacuum at Idle 17-18 Inches

Dimensions: Flange, four-bore—4 bolt type.
Throttle bore, primary, 1-9/16 inch; secondary, 1-11/16 inch I. D.
Primary venturi size, primary side, 7/16 inch; secondary, 11/32 inch I. D.
Main venturi size, primary side, 1-3/16 inch; secondary side, 1-9/16 inch I. D.

Vents: Inside (2) in air horn: Outside (2) in air horn.

Low Speed Circuit: (Primary side only)
Jet, size No. 67 (.032 inch) drill.
By-pass, size .057 inch diameter.
Economizer, size No. 56 (.0465 inch) drill.
Idle bleed, size No. 54 (.055 inch) drill.
Idle port, slot type, length .220 inch; width .030 inch.

Idle Port Opening: .152 to .158 inch above top edge of valve with valve tightly closed.

Lower Port: (For idle adjustment screw), size .0635 inch diameter.

Set Idle Adjustment Screw: 1½ to 2½ turns open. For richer mixture turn screw out. Idle engine at 450 R.P.M. for Auto Trans. in Drive Range.

Main Nozzle: Installed permanently. DO NOT REMOVE. Anti-percolator bleed primary, (tube in venturi assembly) size No. 70 (.028 inch) drill. Secondary, (drilled hole in venturi assembly) size No. 57 (.043 inch) drill.
Under strut bleed, primary side only, size No. 42 (.0935 inch) drill.

Main Vent Tube: (In venturi assembly) Side holes primary 1—size No. 40 (.060 inch) drill, secondary no side holes.

Secondary Initial Discharge: (In venturi assembly, secondary side only).
Pick up tube, size No. 56 (.0465 inch) drill.
Air bleed size, No. 60 (.040 inch) drill.
Discharge port (upper) size, No. 53 (.0595 inch), (lower) size, No. 60 (.040 inch) drill.

Accelerating Pump: Discharge jet (twin) primary side only, size No. 70 (.028 inch) drill. Intake disc check (screw plug) size .115 to .120 inch diameter. Disc check bleed size .016" to .020". Discharge needle seat, size .070 inch diameter.

Choke: Carter Climatic® Control set on index. Butterfly type—offset choke valve, primary side only. Choke heat suction hole, restriction in body, size No. 45 (.082 inch) drill.

Vacuum Spark Port: Horizontal slot (round end) .055 x .130 inch. Top of port .015 to .025 inch above top edge of valve with valve tightly closed.

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3770

FLOAT ALIGNMENT: Side of floats, parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding. To adjust, bend float lever.

FLOAT LEVEL: 3/16 inch (Gauge T109-28) plus or minus 1/64 inch between top of floats at outer end and air horn gasket. To adjust, bend float lever.

FLOAT DROP: 23/32 inch plus or minus 1/16 inch between top of floats at outer end and air horn gasket. To adjust, bend stop tabs on float brackets.

PUMP: 17/32 inch from the top of the bowl cover to the top of the plunger shaft with throttle connector rod in inner hole (long stroke) of pump arm.

CHOKE PISTON LEVER ADJUSTMENT: 3/32 inch (Gauge T109-125) between choke lever and stop in piston housing with choke held closed. To adjust, take slack out of linkage by setting counter shaft lever.

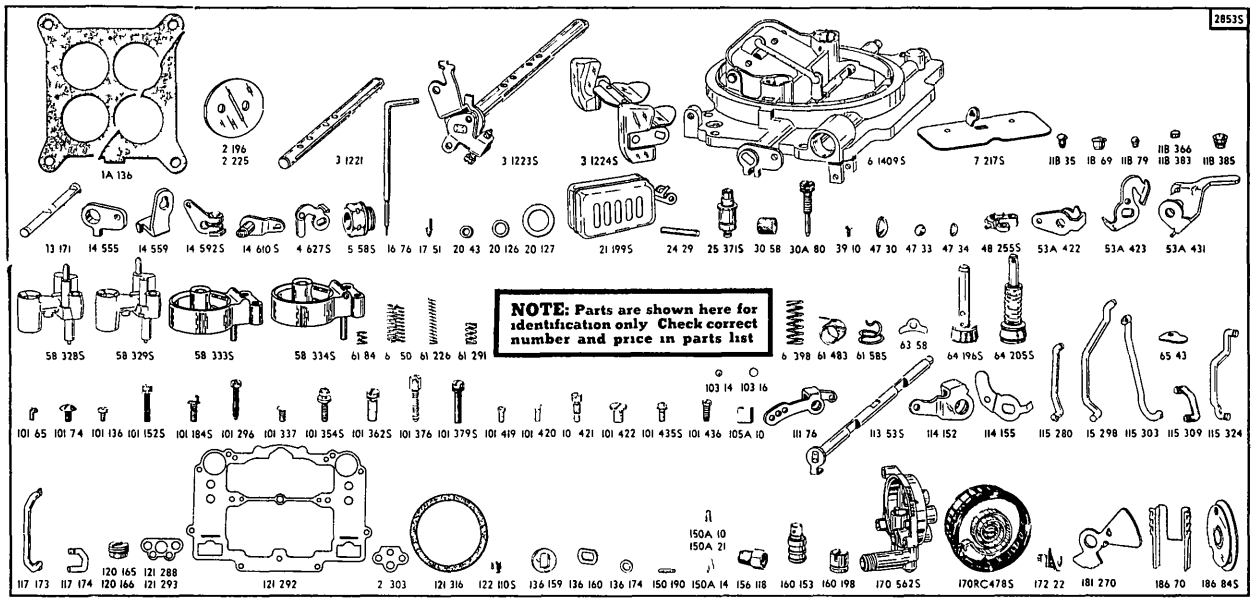
FAST IDLE LINKAGE ADJUSTMENT: With slight clearance between lug on fast idle cam and stop on flange casting, and inner countershaft lever contacting lug on outer conutershaft lever align index mark on cam with adjusting screw. To adjust, bend fast idle connector rod. It may be necessary to bend stop lug on fast idle cam.

FAST IDLE THROTTLE VALVE CLEARANCE: .030 inch (Gauge T109-29) between lower edge of valve and bore with adjusting screw on index mark of cam.

FAST IDLE ON CAR: 550 R.P.M. hot engine—with fast idle screw on lowest (last) step of cam.

UNLOADER: 1/8 inch (Gauge T109-36) between upper edge of choke valve and inner wall of air horn. To adjust, bend unloader arm on throttle lever.

SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Block choke valve wide open. 2. with 15/32 inch between lower edge of primary valve and bore (opposite idle port) secondary valves should just start to open. To adjust, bend throttle operating rod. NOTE: At wide open throttle primary and secondary valves will reach vertical position. 3. With primary and secondary throttle valves in tightly closed position there should be .010" to .030" (Gauge T109-29) between positive closing secondary shoe and cam on primary throttle lever. To adjust, bend shoe on secondary lever.



DASH POT: 1. 1/8 inch from the top of the bowl cover to the top of the plunger shaft with primary valves tightly closed. To adjust, bend the flat portion of the dash pot lever. Check to be sure dash pot lever does not contact bowl cover attaching screw. 2. 7/16 inch from the top of the bowl cover to the top of the plunger shaft with primary valves wide open. To adjust, bend stop lug on flat lever. Check to be sure plunger shaft operates without sticking in hole in bowl cover.

MARCA REGISTRADA

Lincoln—1959—Carbureter No. 2853S

WHEN SERVICING, USE GASKET ASSORTMENT No. 328, RE-CARBURETION KIT No 1974N

PART NAMES IN CAPITAL LETTERS LISTED BELOW INDICATE CONTENTS OF RE-CARBURETION KIT

Part No	PART NAME	
1A-136	—FLANGE GASKET	
2-196	Secondary throttle valve	(2)
2-225	—Primary throttle valve	(2)
3-1221	—Secondary throttle shaft	
3-1223S	—Primary throttle shaft and lever assembly	
3-1224S	—Auxiliary throttle shaft valve and weight assembly	
6-1409S	—Air horn assembly	
7-217S	Choke valve and lever assembly	
11B-35	Rivet plug	
11B-69	Rivet plug	(2)
11B-79	Rivet plug	(2)
11B-366	Lead plug	(2)
11B-383	Lead plug	(2)
11B-385	Idle port and fuel passage plug	(3)
13-171	Choke shaft	
14-555	Inside countershaft lever	
14-559	Countershaft lever (to choke valve)	
14-592S	Countershaft lever screw and nut assembly	
14-610S	Choke lever and shaft assembly (piston housing)	
14-627S	—Choke piston link and lever assembly	
15-58S	Fuel inlet fitting assembly	
16-76	—STEP UP ROD—STANDARD 0665" x 053"	(2)
17-51	Pump discharge check needle	
20-43	Piston housing gasket	
20-126	Needle seat gasket	(2)
20-127	Fuel inlet fitting gasket	
21-199S	—Float and lever assembly	(2)
24-29	Float lever pin	(2)
25-371S	—NEEDLE AND SEAT ASSEMBLY (1015")	(2)
30-58	Fuel inlet strainer	
30A-80	Idle adjustment screw	(2)

Part No	PART NAME	
39-10	Choke valve attaching screw	(2)
47-30	Piston housing welsh plug	
47-33	Venturi welsh plug	(4)
47-34	Spark port welsh plug	
48-255S	Pump jet housing	
53A-422	Dash pot arm (outer)	
53A-423	Secondary throttle operating lever	
53A-431	Dash pot arm (inner)	
58-328S	—Primary venturi assembly (choke side)	
58-329S	—Primary venturi assembly (pump side)	
58-333S	—Secondary venturi assembly (choke side)	
58-334S	—Secondary venturi assembly (pump side)	
61-84	Idle adjustment screw spring	(2)
61-150	Dash pot return spring	
61-226	STEP UP PISTON SPRING	(2)
61-291	Throttle lever adjusting screw spring	
61-398	Pump spring (lower)	
61-483	Secondary throttle return spring	
61-585	Step up rod retaining spring	(2)
63-58	Coil housing retainer	(3)
64-196S	DASH POT PLUNGER ROD AND CHECK ASSEMBLY	
64-205S	PUMP PLUNGER ROD AND SPRING ASSEMBLY	
65-43	Step up piston cover plate	(2)
101-65	Piston housing choke shaft lever attaching screw	
101-74	Throttle shaft lever attaching screw	(2)
101-136	Coil housing attaching screw	(3)
101-152S	Air horn attaching screw and washer assembly	(2)
101-184S	Pump jet housing attaching screw and washer assembly	(2)
101-296	Fast idle adjustment screw	

Part No	PART NAME	
101-337	Countershaft lever attaching screw	
101-354S	Countershaft lever clamp screw and washer assembly	
101-362S	Air horn attaching screw and washer assembly	(8)
101-376	Throttle lever adjusting screw	
101-379S	Venturi attaching screw and washer assembly	(8)
101 419	Secondary throttle valve attaching screw	(4)
101 420	Primary throttle valve attaching screw	(4)
101-421	Pump arm attaching screw	
101-422	Fast idle cam attaching screw	
101-435S	Step up piston cover plate attaching screw and washer assembly	(2)
101 436	Piston housing attaching screw	(3)
103-14	Lead shot (180" dia)	
103-16	Lead shot (200" dia)	
105A-10	Countershaft lever clamp screw nut	
111-76	Pump arm	
113 53S	—Countershaft and lever assembly	
114-152	Primary throttle shaft arm (inner)	
114-155	—Primary throttle shaft arm (outer)	
115 280	Fast idle connector rod	
115-298	Throttle connector rod	
115-303	Choke connector rod	
115-309	Throttle operating rod	
115-324	—Dash pot connector rod	
117-173	Choke valve connector link	
117-174	Pump connector link	
120-165	Secondary metering jet (086")	(2)
120-166	PRIMARY METERING JET (0935")	(2)
121 288	PRIMARY VENTURI CLUSTER GASKET	(2)
121-292	AIR HORN GASKET	
121-293	SECONDARY VENTURI CLUSTER GASKET	(2)
121-303	PUMP JET HOUSING GASKET	
121-316	COIL HOUSING GASKET	
122-110S	—Pump intake disk check assembly	
136-159	Primary throttle shaft washer	
136-160	Secondary throttle shaft washer	
136 174	Throttle lever adjusting screw washer	
150-190	Choke piston pin	
150A-10	Pin spring	(6)
150A-14	Pin spring	
150A-21	Pin spring	
156-118	Spark fitting	
160-153	Step up piston	(2)
160-198	—Choke piston	
170 562S	Piston housing and plug assembly	
170RC-478S	—Thermostatic coil and housing assembly	
172-22	Throttle connector rod retainer	
181-270	—Fast idle cam	
186-70	Fuel bowl baffle	(2)
186-84S	—Choke baffle plate assembly	

—Parts so marked are new and listed for the first time

NOTE **Figures in parentheses indicate number of pieces used in one carbureter Where no figure is shown only one is used**

CARTER MODEL AFB CARBURETER FOR LINCOLN (SERVICE ADJUSTMENT PROCEDURE)

NOTE: The parts and specification pages referred to are catalog pages. These pages can be obtained from Carter-Carburetor, Catalog Department, St. Louis (7), Missouri. Specify the carbureter number found on the base of carbureter, when requesting specification pages.

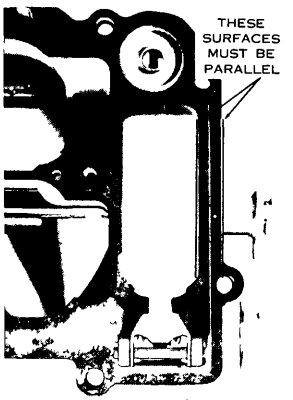

Figure 1 Left

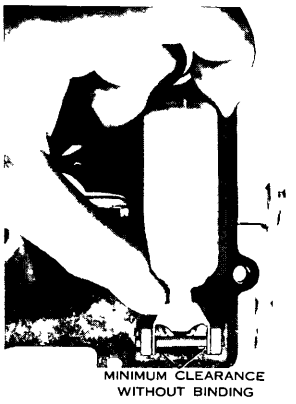

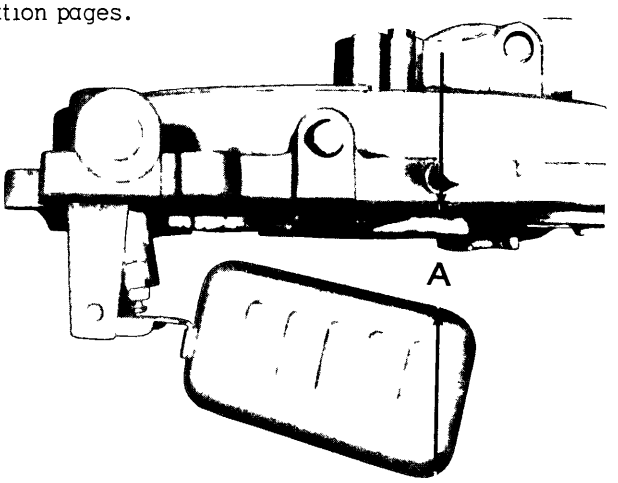

Figure 1 Right

FLOAT ALIGNMENT ADJUSTMENT (Fig. 1):

1. Sight down the side of the float shell to determine if the side of the float is parallel to the outer edge of the air horn casting. TO ADJUST: Bend float lever by applying pressure to the end of the float shell with the fingers while supporting the float lever with the thumb.

CAUTION: To avoid damaging the float, apply only enough pressure to bend float lever.

2. After aligning float, remove as much clearance as possible between arms of float lever and lugs on air horn by bending the float lever. Arms of float lever should be as parallel to the inner surfaces of lugs on air horn as possible.

   Floats must operate freely without excess clearance on its hinge pin.

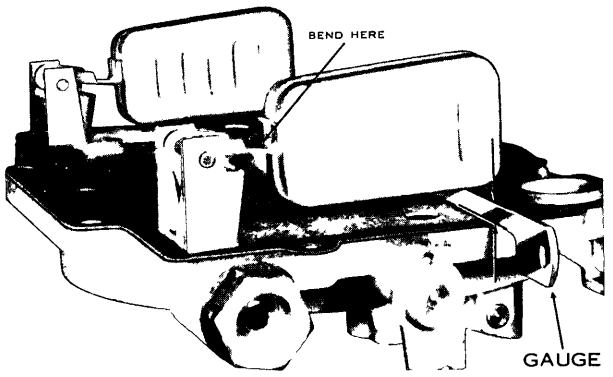

Figure 2

FLOAT LEVEL ADJUSTMENT (Fig. 2):

With air horn inverted, bowl cover gasket in place and needle seated, there should be the clearance as listed on carburetor specification page between outer end of float and air horn gask t. To adjust, b nd float arm. Adjust both floats. Recheck float alignment.

FLOAT DROP ADJUSTMENT (Fig. 3):

With bowl cover held in upright position and measuring from outer end of float, the distance (A) between top of floats and bowl cover gasket should be as listed on specification page. To adjust, bend stop tabs on float brackets.

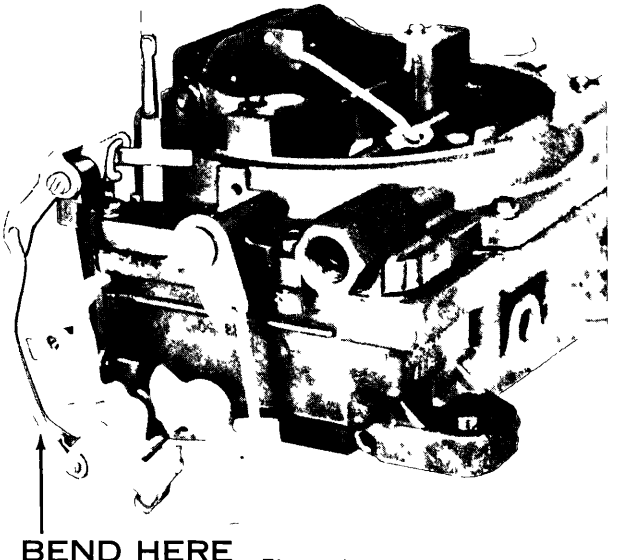

Figure 4

PUMP ADJUSTMENT (Fig. 4):

1. Back out idle speed screw until throttle valves s at in bores of carburetor. NOTE: Be sure choke is wid open so fast idle cam does not hold throttle valve open.
2. With throttle connector rod in inner hole (long strok) of pump arm, the distance from the top of the bowl cover to the top of the plung r shaft should b as specified on carbur tor specification page.
3. Adjust by bending throttle connector rod at lower angle (use tool T109-213).

CARBURETER

TRADE MARK REG. U. S PAT. OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.

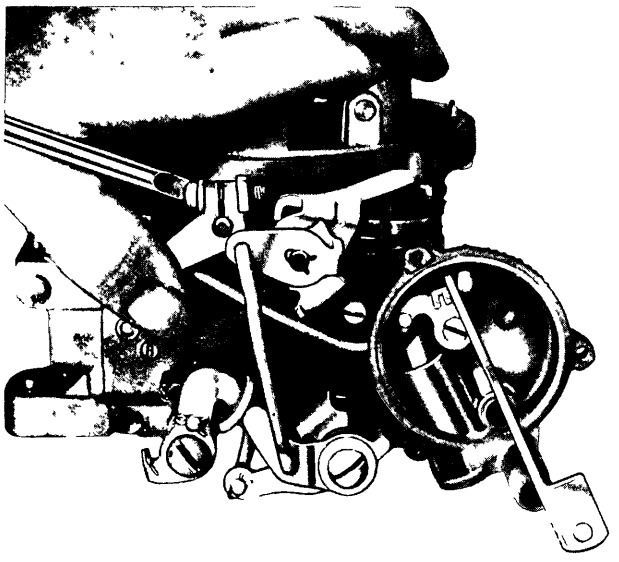

Figure 5

CHOKE PISTON LEVER ADJUSTMENT (Fig. 5):

Loosen countershaft lever clamp screw. Take end play out of countershaft, and hold choke valve tightly closed. Tak slack out of linkage by pressing countershaft lever towards closed position with gauge in place between choke lever and stop in piston housing. Hold in place and tighten clamp screw.

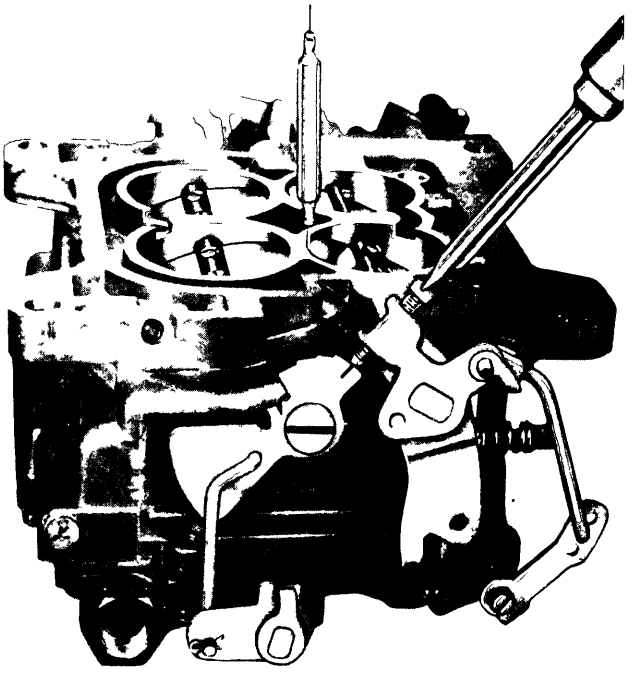

Figure 7

FAST IDLE THROTTLE VALVE CLEARANCE ADJUSTMENT (Fig. 7):

With choke valve tightly closed, tighten fast idle adjusting screw (on index mark of cam) until the clearance between throttle valve and bore of carbureter, side opposite idle port, is as listed on carbureter specification page.

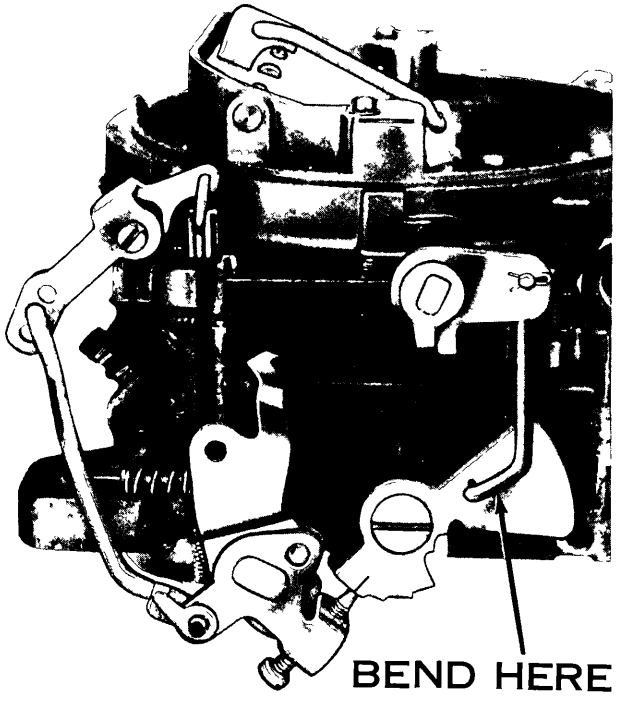

Figure 6

FAST IDLE LINKAGE ADJUSTMENT (Fig. 6):

With chok valv tightly clos d and lug on out r choke shaft lev r contacting stop on inn r chok shaft l v r align c nt r of fast idl scr w with ind x mark on cam. To adjust, bend fast idl conn ctor rod. (Use tool T109-213).

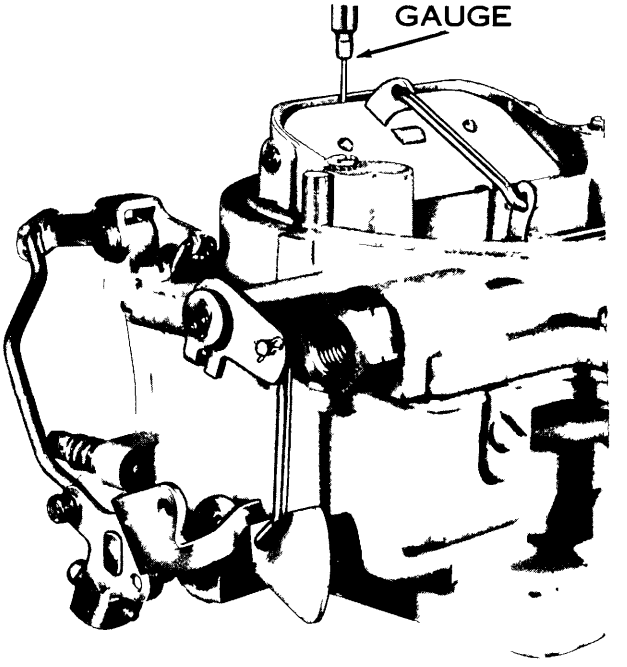

Figure 8

UNLOADER ADJUSTMENT (Fig. 8):

With throttl wid op n th r should b the clearance as listed on carburet r sp cification pag between upp r dg of chok valv and inn r wall of air horn. To adjust, b nd unload r lip on throttl shaft lev r. (Us tool T109-214).

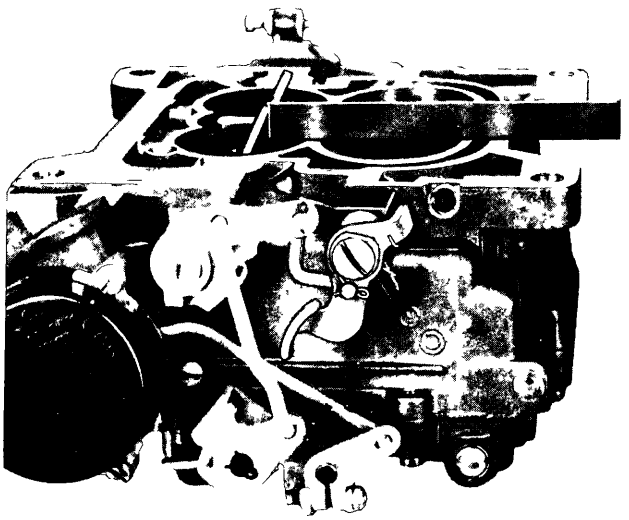

Figure 9A

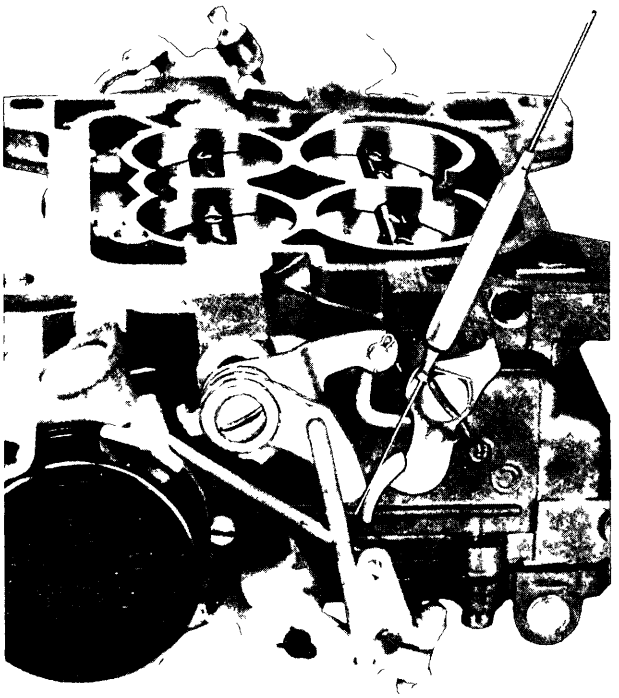

Figure 9B

SECONDARY THROTTLE LEVER ADJUSTMENT (Figs. 9A and 9B):

1. Block choke valve wide open.
2. Secondary throttle valves should just start to open when primary throttle valves are opened to the clearance as listed on specification page between lower edge of valve and bore (opposite idle port). To adjust, bend throttle operating rod. (Use bending tool T109-213). (See Fig. 9A) NOTE: Primary and secondary throttle valves should reach wide open position, full vertical, at the same time.
3. With primary and secondary throttle valves in tightly closed position, there should be the clearance as listed on specification page between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoes on secondary lever. (See Fig. 9B).

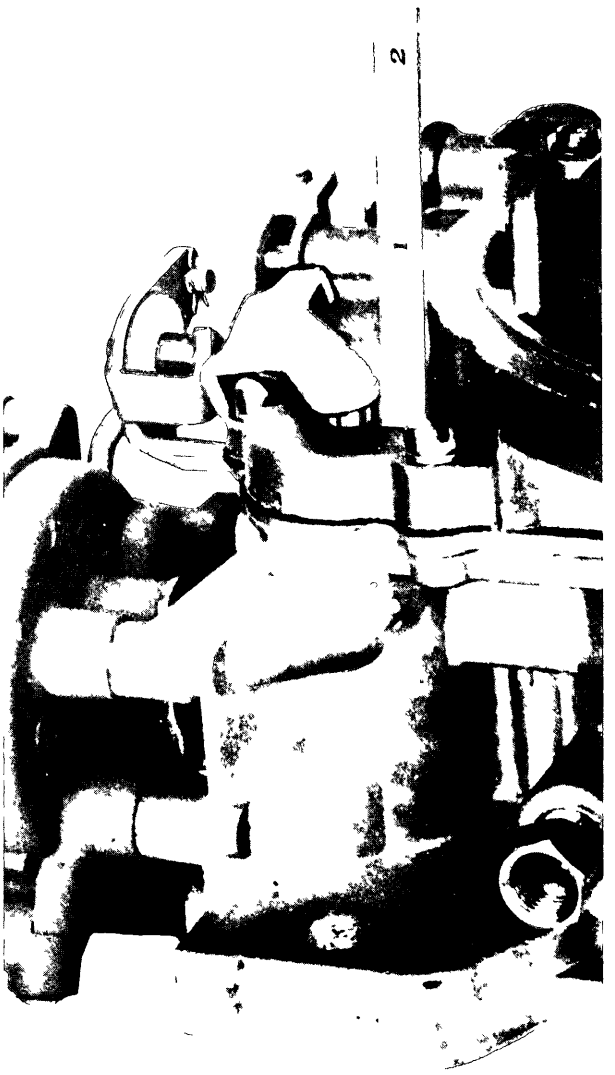

Figure 10

DASH POT ADJUSTMENT (Fig. 10):

1. With primary valves tightly closed there should be the distance as listed on specification page between the top surface of the bowl cover and the top of the plunger shaft. To adjust, bend the flat portion of the dash pot lever. Check to be sure dash pot lever does not contact bowl cover attaching screw.
2. With primary valves wide open there should be the distance as listed on specification page between the top surface of the bowl cover and the top of the plunger shaft. To adjust, bend stop lug on dash pot lever. (Use bending tool T109-22). Check to be sure plunger shaft operates without sticking in hole in bowl cover.

NOTE: See last page for pertinent service information.

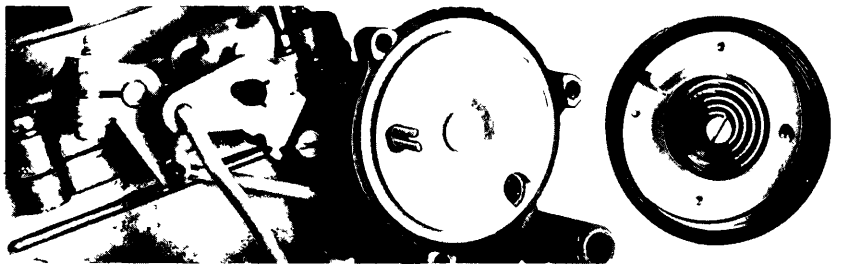

Figure 11

FIGURE 11:

After choke baffle plate assembly has b en properly installed as shown in Fig. 11 install gasket and coil housing with the lip on the coil spring installed in the slot of the piston lever.

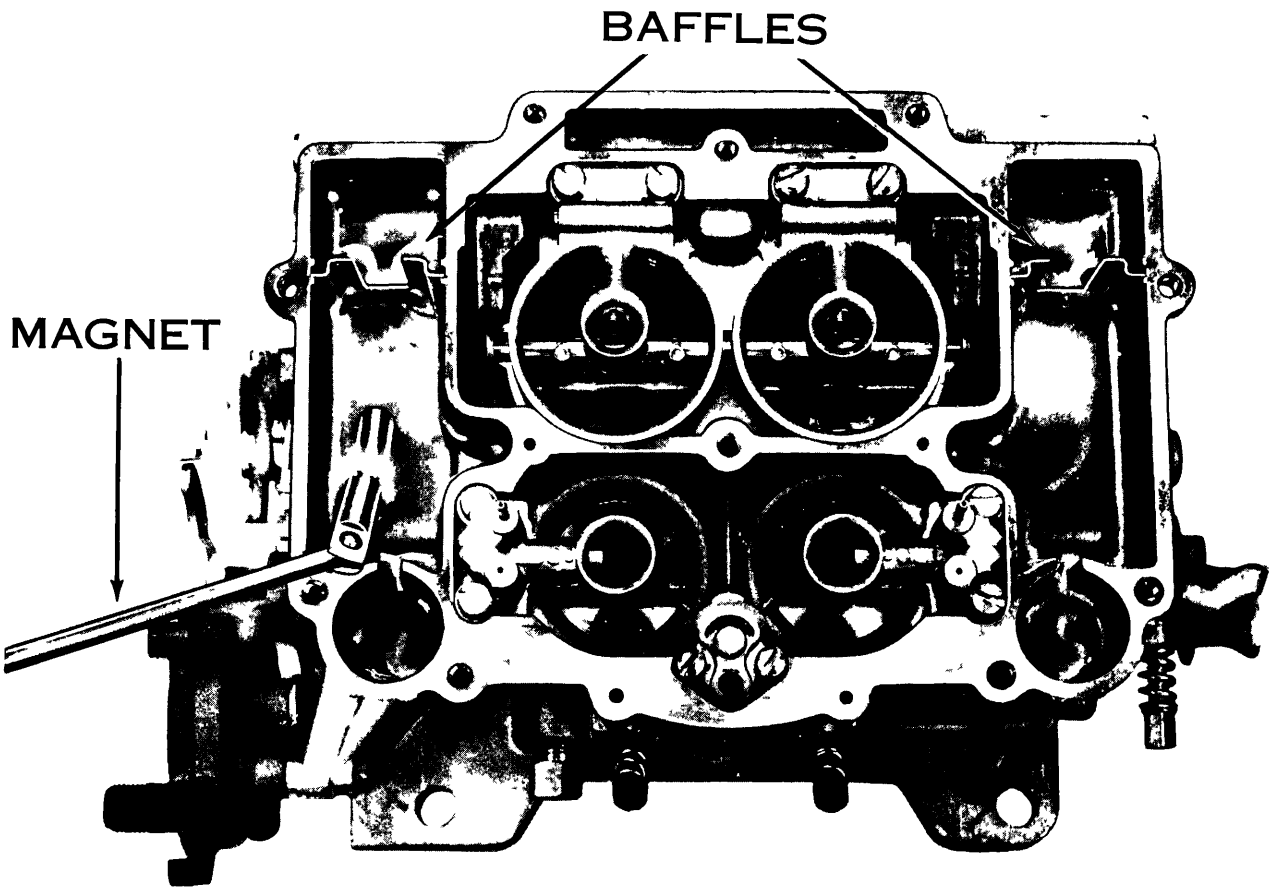

Figure 12

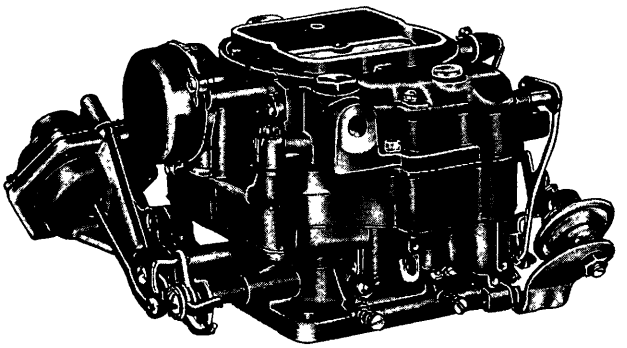
FIGURE 12:

Flooding, stumble on acceleration and other performance complaints are, in many instances, caused by the presence of dirt, water or oth r foreign matter in the carbureter. To aid in diagnosing the cause of the complaint, the carbureter should be carefully remov d from the engine without draining the fuel from the bowl. The contents of the fuel bowl may then be examin d for contamination as the carbureter is disassembled.



Check the fuel in the bowl for contamination by dirt, water, gum or other foreign matter. A magnet moved through the fuel in th bowl will pick up and identify any iron oxide dust that may have caused intake needle and seat leakage.

Inspect gasketed surfaces between body and air horn. Small nicks or burrs should be smoothed down to eliminate air or fu l leakage. Be especially particular when inspecting the top surface of the inner wall of the bowl around the vacuum piston passage. A poor seal at this location may contribute to a "cutting-out" on turns complaint.

Install fuel baffles as shown (Fig. 12) to prevent damage of floats.

Fill the carbur ter bowl with clean fu l before installing on the manifold. This will h lp prev nt dirt trapped in th fuel syst m from being dislodged by the free flow of fuel as the carbureter is primed. The operation of the floats and intake needl and seats may be checked under pr ssure if a fuel pump is used at th b nch to fill th carbur ter bowl. Operate the throttl sev ral times and visually check the discharge from the pump jets.

Before installing the carbur ter, hold ch ke valv open and turn the idl sp ed scr w until it just contacts th throttle lev r, then ½ a turn more to open the throttle valves enough to keep the engine running, until the idle mixture and final R.P.M. adjustment can be made.

LINCOLN
MODELS
"CAPRI" & "PREMIERE"
1957

(Also used on Mercury "Turnpike Cruiser" with 368 Cu. In. Engine)

WCFB Four-Bore Down-Draft Climatic® Control **Carbureters Nos. 2404S-2404SA**

CARBURETER SPECIFICATIONS

For Lincoln 8 Cylinder Engine: 4.00 Inch Bore, 3.66 Inch Stroke

Dimensions: Flange, four bore—4 bolt type.
Throttle bore, size, 1-7/16 inch I. D.
Primary venturi size, 11/32 inch I. D.
Main venturi size 1-3/16 inch.

Vents: Outside, none. Inside (5).

Gasoline Intake: Primary, size No. 38 (.1015 inch); secondary, size No. 42 (.0935 inch) drill hole in needle seat.

Low Speed Jet Tube: (Primary side only). Jet, size No. 69 (.0292 inch) drill.
By-pass, in body, size (.0625 inch) diameter.
Economizer, in body, size (.0492 inch) diameter.
Idle bleed, in body, size No. 55 (.052 inch) drill.

Idle Port: (Upper) slot type. Primary, length .160 inch; width .030 inch. Secondary, none.

Idle Port Opening: Primary, .125 to .131 inch above top edge of valve with valve tightly closed. Secondary, none.

Lower Port: Primary (for idle adjustment screw), size No. 50 (.070 inch) drill. Secondary, none.

Set Idle Adjustment Screw: 1/2 to 1 1/2 turns open. For richer mixture turn screw out. Idle engine between 475 and 500 r.p.m. (in neutral).

Main Nozzle: Installed permanently. DO NOT REMOVE. Anti-percolating well restriction (primary, in plug) size No. 67 (.032 inch) drill, (secondary, in plug) size No. 55 (.052 inch) drill.

Metering Rod: Vacuum operated. See Parts List for size.

Metering Rod Jet: Primary, size .1015 inch diameter (for metering rod).
Secondary size .073 inch diameter (no metering rod).

Accelerating Pump: Discharge jet (twin) primary side only, size No. 69 (.0292 inch) drill. Intake ball check seat, size .115 to .120 inch diameter. Discharge needle seat, size .070 inch diameter. Relief passage (vent) to fuel chamber No. 42 (.0935 inch) drill. Discharge relief plug, size No. 55 (.052 inch) drill.

Choke: Carter Climatic® Control, set 1 point rich. Butterfly type—offset choke valve, primary side only. Choke heat suction hole, restriction in piston housing, size No. 38 (.1015 inch) drill.

Vacuum Spark Port: Slot type round end .130 x .055 inch. Bottom of port .020-.030 inch above valve with valve tightly closed.

Motor Tune-Up—Be Accurate!

CAUTION: **Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.**

Spark Plug Gap .035"	Breaker Point Setting .014"-.016"	Ignition Timing Breaker Points to Open: 5° B. T. D. C. At Vibration Damper	Float Setting See Adjustments	Idle Adjustment Screw Setting 1/2 to 1 1/2 Turns Open Idle Engine at 475 to 500 R.P.M. In Neutral

NOTE: **These cars are equipped with Hydraulic Valve Lifters—N Adjustment.**

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3688

FLOAT LEVEL: Primary 1/16" (Gauge T109-293); secondary 3/16" (Gauge T109-222) between top of float and machined surface of casting. To adjust: bend float arms.

FLOAT DROP: Primary 9/16", secondary 11/16". To adjust: bend stop tabs on float bracket.

PUMP: Flat on pump arm should parallel straight edge on dust cover boss. To adjust: bend connector rod.

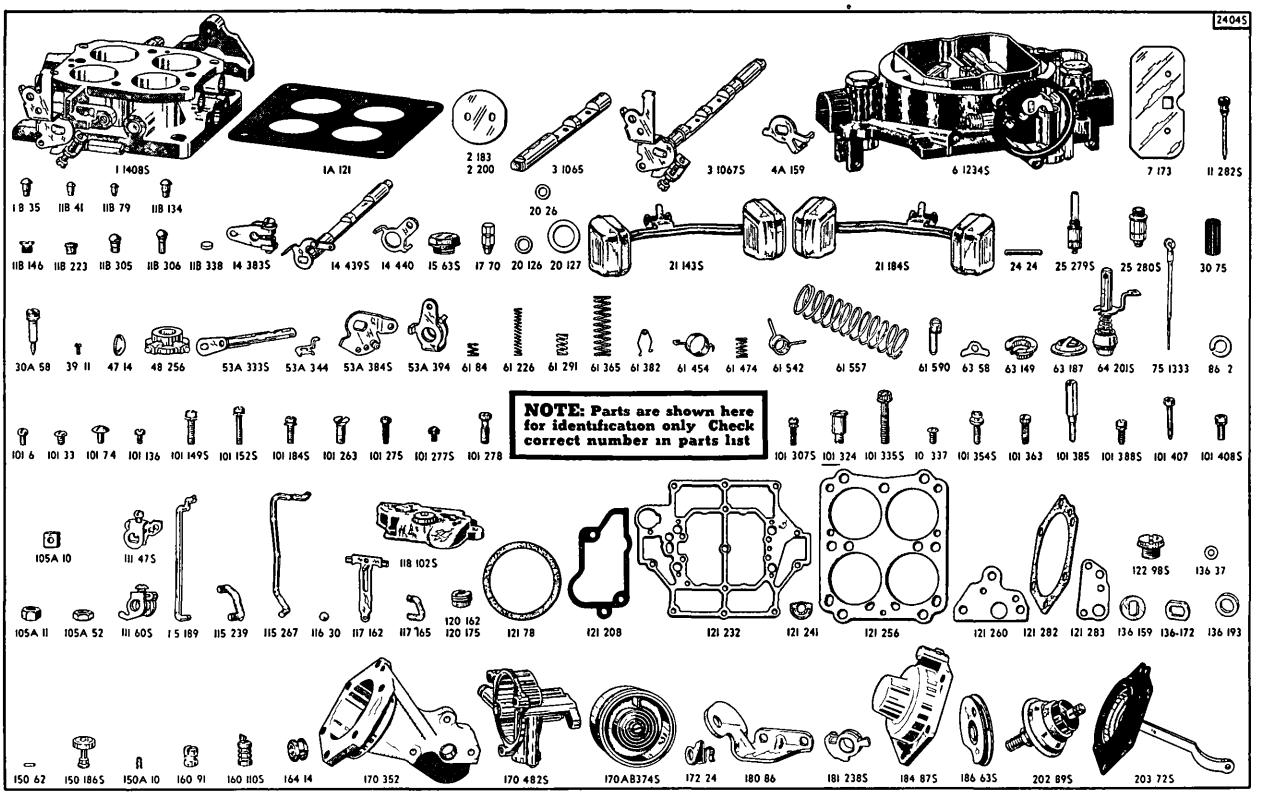
METERING ROD: Metering rod should bottom with throttle valves seated.

BOWL VAPOR VENT: 1/16" (Gauge T109-197) between bowl vapor vent valve and dust cover. To adjust: bend vapor vent arm.

FAST IDLE CAM CLEARANCE: With choke valve closed lip of fast idle cam should lightly contact boss on flange casting. To adjust: set choke shaft lever.

FAST IDLE THROTTLE VALVE CLEARANCE: .030" (Gauge T109-29) between lower edge of valve and bore with adjusting screw on high step of cam.

FAST IDLE ON CAR: 800 R.P.M. with speed screw on lowest (last) step of cam.



UNLOADER: 1/8" (Gauge T109-36) between upper edge of choke valve and inner wall of air horn. To adjust: bend unloader arm on throttle lever.

PRIMARY THROTTLE SHAFT DOG: 1. Place a .030" (Gauge T109-29) between wide open stop tang on primary throttle lever and stop on flange 2. Adjust upper lug of throttle shaft dog so that upper arm of spring lightly contacts tang of throttle operating lever. 3. Hold both primary and secondary throttles in wide open position. 4. Adjust lower lug of throttle shaft dog so that lower arm of spring lightly contacts center web of throttle operating lever. NOTE: Use bending tool T109-214 to adjust lugs on throttle shaft dog.

SECONDARY OPERATING LEVER: 1. Block choke valve wide open. 2. Back out throttle lever stop screw so that primary valves seat in carbureter bores. 3. When the primary and secondary throttle valves are seated there should be a minimum clearance of .010" between lug on secondary operating lever and stop on primary throttle shaft dog. To adjust, bend lug on secondary operating lever. (Use tool T109-214.) NOTE: Secondary valves seat at top edge only.

DASH POT (SLOW CLOSING THROTTLE): Plunger shaft should bottom with 1/16" (Gauge T109-197) placed between shaft and operating lever with throttle valves seated.

DIVISION OF ACF INDUSTRIES INCORPORATED
ST. LOUIS, MO., U. S. A.

Fil Under Lincoln

CARTER MODEL WCFB CARBURETER FOR LINCOLN (SERVICE ADJUSTMENT PROCEDURE)

NOTE: The parts and specification pages referred to are catalog pages. These pages can be obtained from Carter Carburetor, Catalog Department, St. Louis (7), Missouri. Specify the carbureter number found on the brass identification tag, when requesting specification pages.

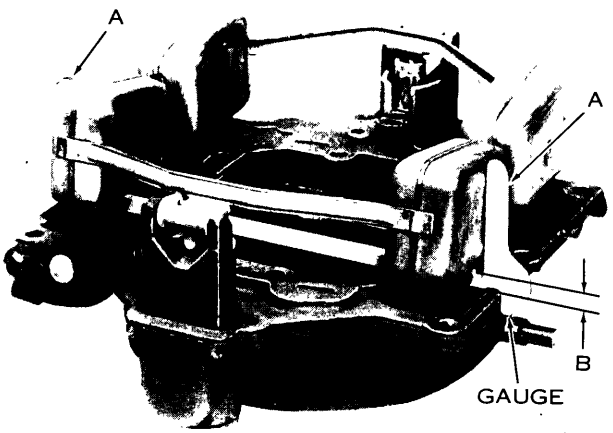

Figure 1

FLOAT ADJUSTMENT (Fig. 1):

1. Lateral - Place float gauge directly under center of floats with notched portion of guage fitted over edge of casting. Side of floats should just clear the vertical uprights (A) of float gauge. To adjust, bend arms of floats.
2. Vertical - With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance (B) between top of float and machined surface of casting must be as listed on carbureter specification page. To adjust, bend center portion of float arms.

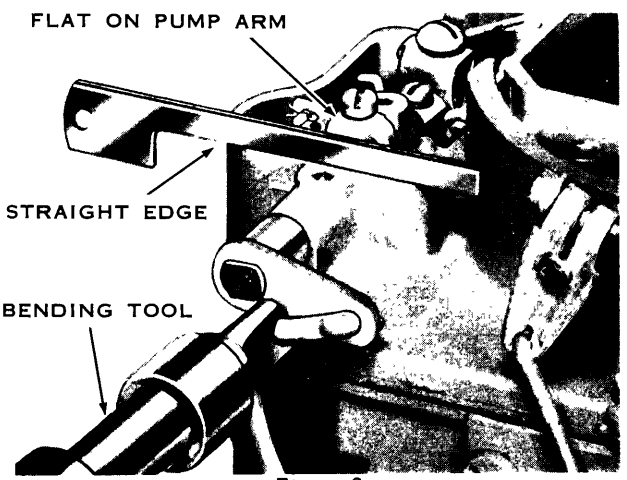

Figure 3

PUMP ADJUSTMENT (Fig. 3):

1. Install pump connector link in outer hole (long stroke) of pump arm with ends extending outward toward countershaft arm.
2. Back out throttl lev r set screw until throttl valves seat in bores of carburet r.
3. H ld straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. To adjust, bend throttle connector r d at upp r angle. (Use tool T109-213).

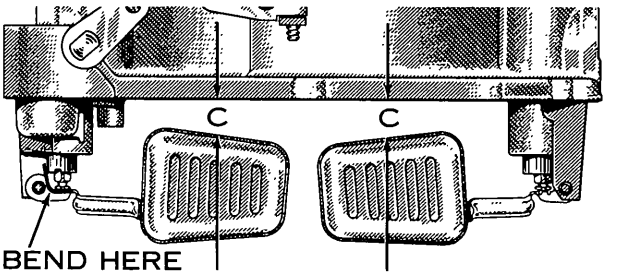

Figure 2

FLOAT DROP ADJUSTMENT (Fig. 2):

With bowl cover held in upright position and measuring from center of floats, the distance (C) betw en top of floats and bowl cover should be as listed on carbureter specification page. To adjust, bend stop tabs on float bracket.

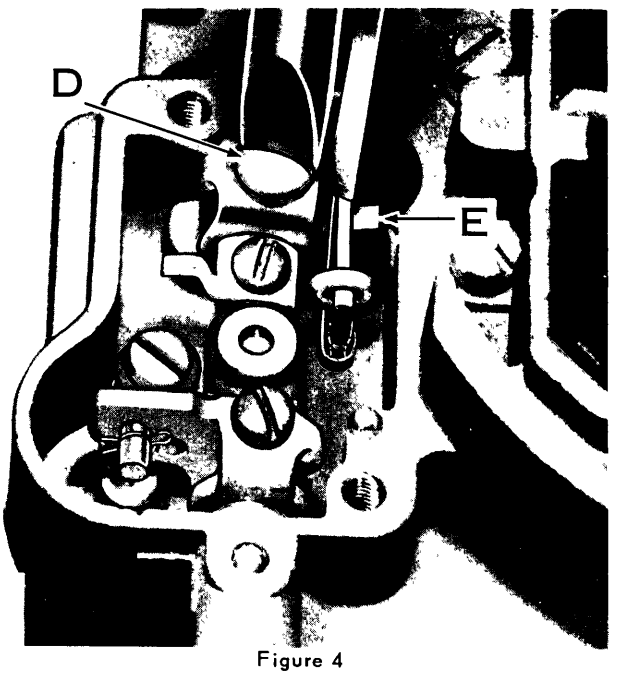

Figure 4

METERING ROD ADJUSTMENT (Fig. 4):

1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and lo sen metering rod arm clamp screw (D).
2. Press down on vacumeter link until metering rods bottom in carbureter body casting.
3. Holding rods in downward position and throttle valves seated, r volve metering rod arm until finger on arm contacts lip (E) of vacumeter link. Hold in place and carefully tighten clamp screw (D).

CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

S S PRINTED IN U.S.A.

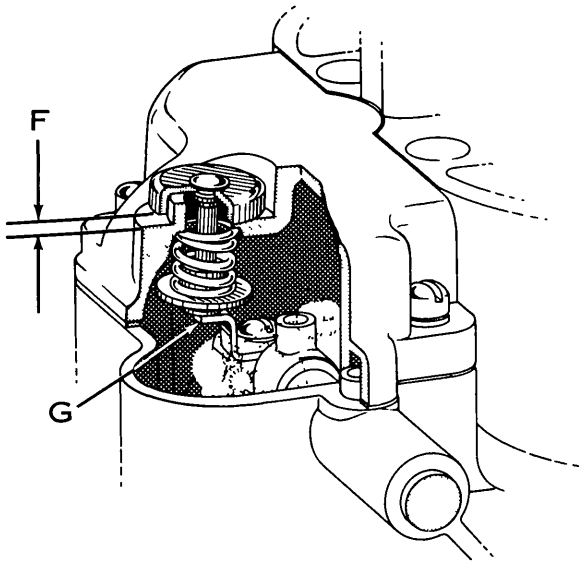

Figure 5

BOWL VAPOR VENT ADJUSTMENT (Fig. 5):

1. Install dust cover and dust cover gasket.
2. With throttle valves seated, there should be the clearance (F) as listed on carbureter specification page between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm (G).

Figure 6A
Fast Idle Adjustment

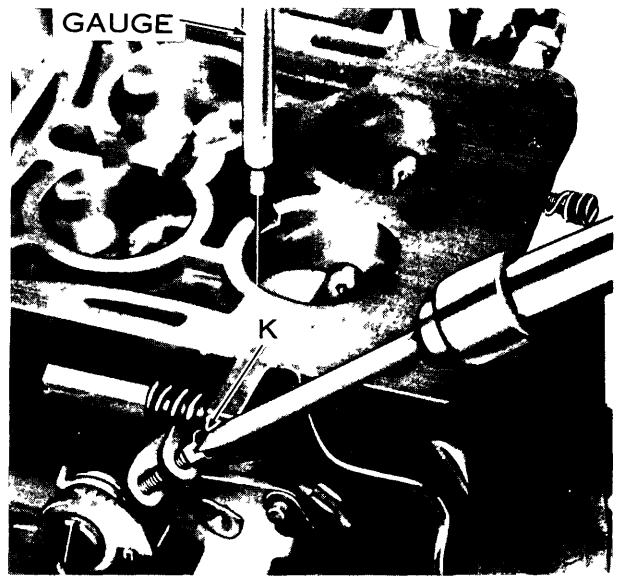

Figure 6B

FAST IDLE CAM CLEARANCE ADJUSTMENT (Fig. 6A):

1. Loosen choke lever clamp screw (H) on choke shaft.
2. Hold choke valve tightly closed. Take slack out of linkage by pressing choke lever towards closed position, so that lip of fast idle cam lightly contacts boss on flange casting (J) - hold in place. Tighten clamp screw (H).

FAST IDLE THROTTLE VALVE CLEARANCE ADJUSTMENT (Fig. 6B):

With choke valve tightly closed, tighten fast idle adjusting screw (K) (on high step of cam) until there is the clearance as listed on carbureter specification page between throttle valve and bore of carbureter, side opposite idle port.

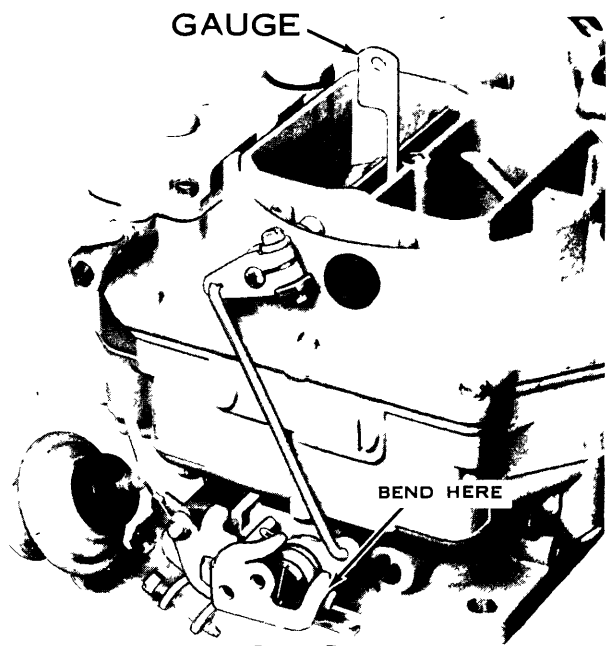

Figure 7

UNLOADER ADJUSTMENT (Fig. 7):

With throttle valve wide open there should be the clearance as listed on carbureter specification page between upper edge of choke valve and inner wall of air horn. To adjust, bend unloader lip on throttle shaft lever. (Us Tool T109-41).

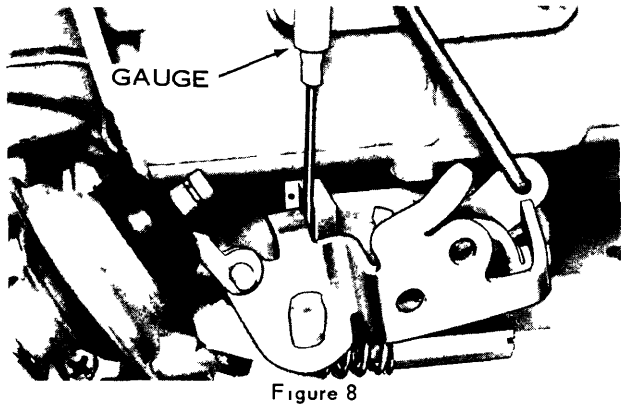

Figure 8

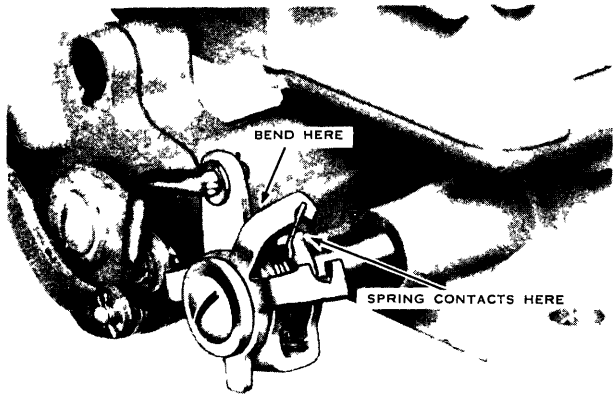

Figure 9

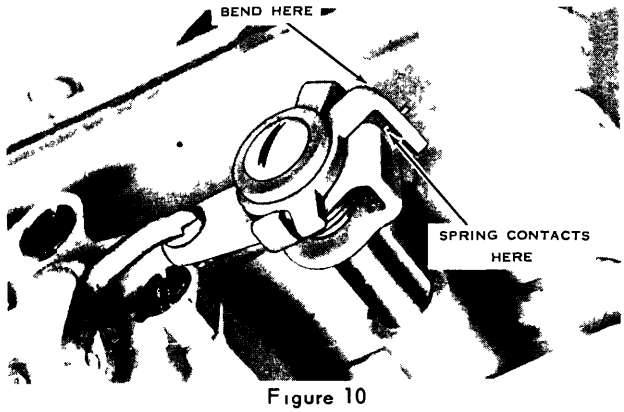

Figure 10

PRIMARY THROTTLE SHAFT DOG ADJUSTMENT (Figs. 8, 9 & 10):

1. Place gauge as listed on carbureter specification page between wide open stop tang on primary throttle lever and stop on flange.
2. Adjust upper lug of throttle shaft dog so that upper arm of spring lightly contacts tang of throttle operating lever.
3. Hold both primary and secondary throttles in wide open position.
4. Adjust lower lug of throttle shaft dog so that lower arm of spring lightly contacts center web of throttle operating lever. NOTE: (Use bending tool T109-214) to adjust lugs on throttle shaft dog.

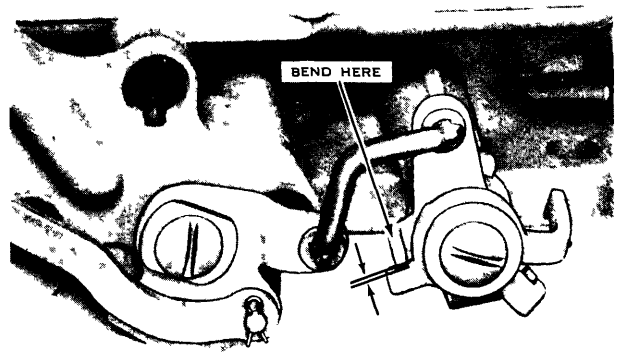

Figure 11

SECONDARY OPERATING LEVER ADJUSTMENT (Fig. 11):

1. Block choke valve wide open.
2. Back out throttle lever stop screw so that primary valves seat in carbureter bores.
3. When the primary and secondary throttle valves are seated there should be the clearance as list d on specification page between lug on secondary operating lever and stop on primary throttle shaft dog. To adjust, bend lug on secondary operating lever. (Us tool T109-214). NOTE: Secondary valv s seat at top edge only.

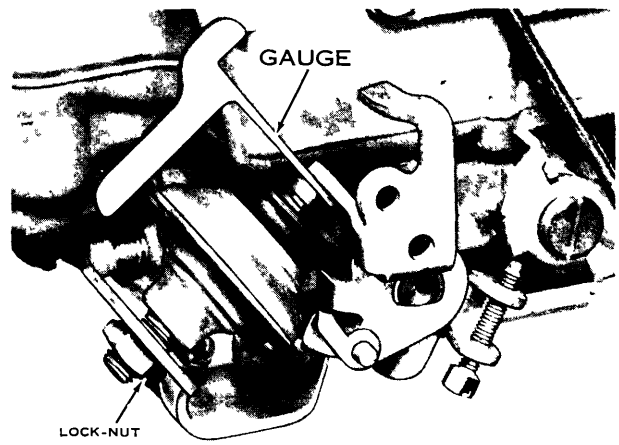

Figure 12

DASH POT (SLOW CLOSING THROTTLE) ADJUSTMENT (Fig. 12):

Plunger shaft sh uld bottom with the gauge list d on carbureter specification page placed betwe n shaft and operating lever with throttle valves tightly closed. To adjust, loosen lock nut and adjust dash pot unit.

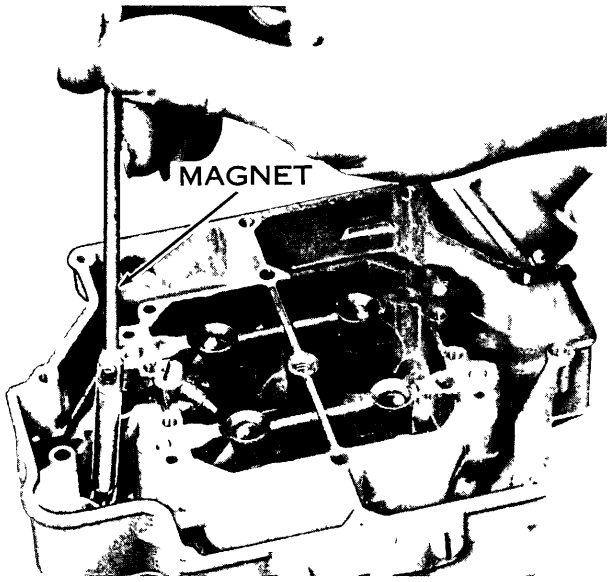

Figure 13

(Fig. 13):

Flooding, stumble on acceleration and other performance complaints are, in many instances, caused by the presence of dirt, water or other foreign matter in the carbureter. To aid in diagnosing the cause of the complaint, the carbureter should be carefully removed from th ngin without draining the fuel from the bowl. The contents of the fuel bowl may then be examined for contamination as the carbureter is disassembled.

Check the fuel in the bowl for contamination by dirt, water, gum or other foreign matter. A magnet moved through the fuel in the bowl will pick up and identify any iron oxide dust that may have caused intake needle and seat leakage. (See Fig. 13.)

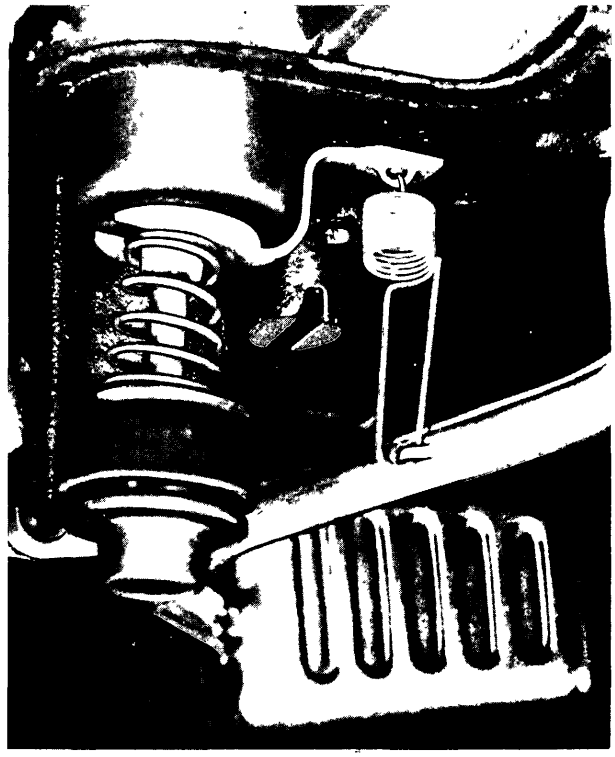

Figure 14

(Fig. 14):

Pump plunger retainer must be parallel with bowl cover.

(Fig. 15):

Secondary throttle valves are seated using a .002" gauge, 1/4" wid (gauge T109-281) between the center of lower edge of throttle valves and bore of carbureter. (S Fig. 15.) With the gauge in position and valve attaching screws loose, tap valve lightly so it will align itself in the bore, hold in position and tighten screws. CAUTION: Turn screws only as much as needed to loosen valve as they are burred over and may break off if forc d. If screws are to be removed, file off staked ends before loosening, then use new screws when reassembling.

NOTE: Primary valves are seated tightly in bore in usual manner. No gauge is used.

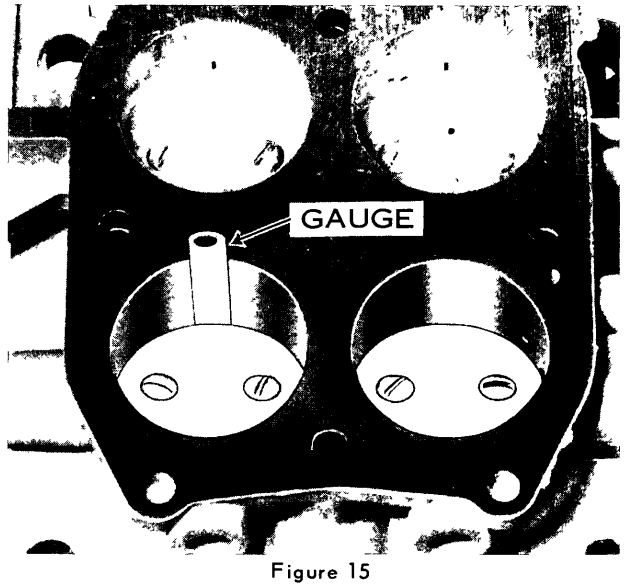

Figure 15

Inspect gask ted surfaces between body and air horn, and between body and flange. Small nicks or burrs should be smoothed down to eliminate air or fuel leakage. Be especially particular when inspecting the top surface of the inner wall of the bowl. A poor seal at this location may contribute to a "cutting-out" on turns complaint.

Fill the carbureter bowl with clean fuel before installing on the manifold. This will help prevent dirt trapped in the fuel system from being dislodged by the free flow of fuel as the carbureter is primed. The operation of the floats and intake n edle and seats may be checked under pressure if a fuel pump is used at the bench to fill the carbureter bowl. Operate the throttle sev ral times and visually check the discharge from the pump jets.

Before installing the carbureter, hold choke valv open and turn the idle speed screw until it just contacts the throttle lever, then 1/2 of a turn more to open the throttle valves nough to keep the engine running until the idle mixture and final R.P.M. adjustment can be mad .

CARTER

AIR CONDITIONING FAST IDLE DEVICE ASSEMBLY (12 VOLT)

INDUSTRIAL ENGINE

MODEL C-2-90D

WGD Down-Draft **Carbureter No. 2743S**

CARBURETER SPECIFICATIONS

For Lycoming-Spencer Two Cylinder 88 Cu. In. Engine

Dimensions: Flange size 1 1/8 inch dual 4 bolt type
Primary venturi 11/32 inch I D
Secondary venturi 21/32 inch I D
Main venturi, 1 3/16 inch I D

Vents Outside 1 Inside 1

Low Speed Circuit: Jet, size No 70 (.028 inch) drill
By pass in bowl cover size (.049 inch) diameter
Economizer in bowl cover size No 55 (.052 inch) drill
Idle bleed in bowl cover, size (.057 inch) diameter
Idle port slot type length .160 inch, width .030 inch

Idle Port Opening: .117 to .123 inch above top edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw): Size .068 to .072 inch diameter

Set Idle Adjustment Screw: 1/4 to 1 1/2 turns open For richer mixture turn screw out Do not idle engine below 1000 R P M

Nozzle: Nozzle is installed permanently DO NOT REMOVE
Anti-percolating bleed size No 66 (.033 inch) drill

Accelerating Pump: Discharge jet (twin) size No 72 (.025 inch) drill
Intake ball check seat size .115 to .120 inch diameter
Discharge (needle seat) size No 50 (.070 inch) drill

Choke: Manual Butterfly type, offset valve

Vacuum Spark Port: None

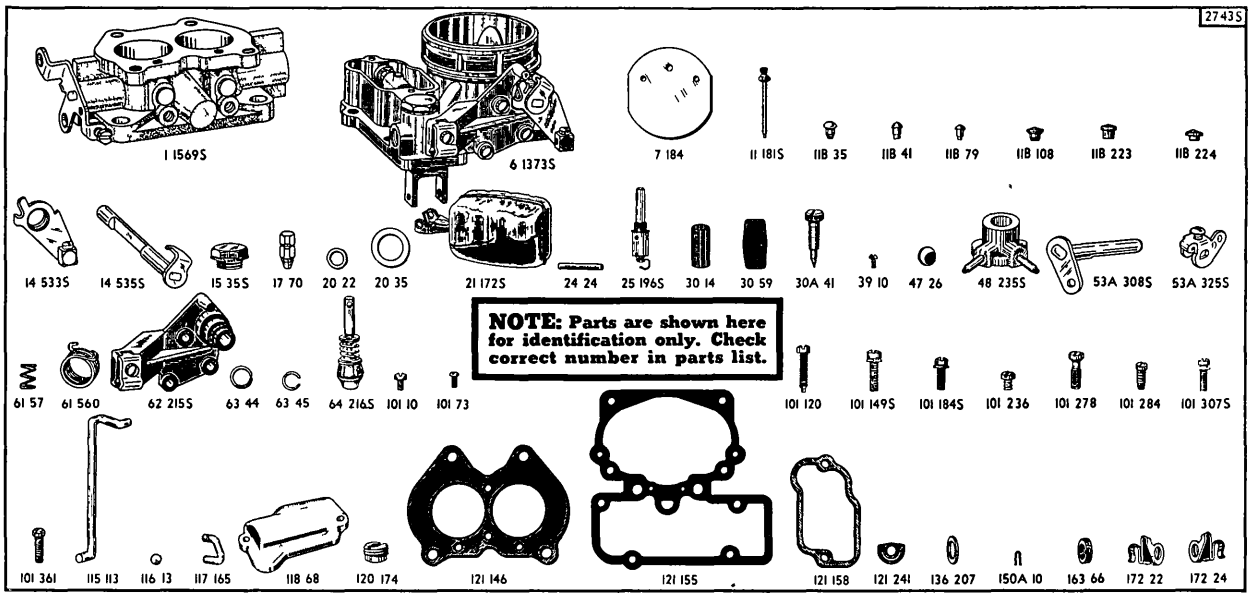
Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .030"	Breaker Point Setting .018"-.022"	Ignition Timing Breaker Points to Open: T.D.C. at Idle At Vibration Damper	Valve Setting (Cold) Intake .005"-.007" Exhaust .005"-.007"	Float Setting 11/64 Inch (Use Gauge T109-166)	Idle Adjustment Screw Setting 1/4 t 1 1/2 Turns Open Idle Engine at 1000 R.P.M.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENTS: With bowl cover gasket removed, bowl cover inverted and needle seated, there should be 11/64 inch (gauge T109-166) between top of float and bowl cover Adjust by bending float arm



PUMP ADJUSTMENT: Back out throttle lever set screw until throttle valves seat in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at upper angle Use bending tool T109-213

INDUSTRIAL ENGINE

MODEL CV4-180

YF Down-Draft **Carbureters Nos. 2428S-2428SA**

CARBURETER SPECIFICATIONS

For Lycoming V-4 Cylinder Engine: 4 Inch Bore, 3.5 Inch Stroke

Dimensions: Flange size 1½ inch S A E
Primary venturi, 11/32 inch I D
Secondary venturi 11/16 inch I D
Main venturi, 1⅜ inch I D

Vents: Outside, none Inside balance vent to air horn above choke valve

Gasoline Intake: Spring loaded needle Size No 46 (.081 inch) drill in needle seat

Low Speed Jet Tube: Jet size No 62 (.038 inch) drill By pass in air horn, size No 56 (.0465 inch) drill Economizer size No 53 (.0595 inch) drill Idle bleed in body size No 54 (.055 inch) drill Bleed idle well to bowl size .0292 inch diameter.

Idle Port: Upper port slot type length .189 to .191 inch width .030 inch.

Idle Port Opening: Top of port .134 to .138 inch above top edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw): .0615 to .0655 inch diameter

Set Idle Adjustment Screw: ¼ to 1¾ turns open For richer mixture turn screw out

High Speed Adjustment Needle: (2428S) ¼ to 1¼ turns open Seat size No 53 (.0595 inch) drill (2428SA) None

Main Nozzle: Nozzle is installed permanently DO NOT REMOVE Anti percolator, size No 53 (.0595 inch) drill

Metering Rod: See parts list for size

Metering Rod Jet: See parts list for size

Accelerating Pump: Diaphragm type vacuum and mechanically operated Pump jet size No 69 (.0292 inch) drill Intake ball check seat (in diaphragm housing) size No 40 (.098 inch) drill Discharge ball check seat (in body) size No 42 (.0935 inch) drill Vacuum restriction (in flange) size No 50 (.070 inch) drill Vacuum passage (diaphragm bleed) size No 65 (.035 inch) drill

Choke: Manual, interconnected with throttle Valve offset butterfly type

Vacuum Spark Port: None

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap	Breaker Point Setting	Ignition Timing Breaker Points to Open: 0° at Idle 36° at 2200 R.P.M.	Valve Setting (Cold)	Float Setting	Idle Adjustment Screw Setting
.025"	.020"		Intake .005"-.007" Exhaust .005"-.007"	⅜ Inch (Use Gauge T109-80)	¼ to 1¾ Turns Open

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: With bowl cover assembly inverted and float resting on pin in seated needle, and with gasket removed, the distance from the bowl cover to the top of float should be ⅜ inch (gauge T109 80). Do not depress float lip against spring in needle, but let float rest of its own weight Adjust by bending lip of float, not float arm

FLOAT DROP: With bowl cover assembly held in upright position the distance between free end of float and bowl cover should be 1-3/16 inch. Adjust by bending stop tabs on float arm.

METERING ROD ADJUSTMENT: This adjustment is important and should be checked each time the carbureter is

S S PRINTED IN U.S.A.

reassembled With throttle valve seated in bore of carbureter, press down on upper end of diaphragm shaft until diaphragm bottoms in vacuum chamber (Tool T109-212 may be used to hold diaphragm shaft down while adjusting metering rod) Metering rod should contact bottom of metering rod well, and metering rod arm should contact lifter link between spring and at supporting lug Adjust by bending lip up or down

ACCELERATING PUMP If acceleration is not satisfactory, remove pump check retainer ring and pump discharge ball check Then remove pump diaphragm assembly Check diaphragm for wear or damage Be sure inlet hole is not clogged with lint or foreign matter Inspect and replace all worn or damaged parts Clean and blow out all passages with compressed air Make sure discharge check seats in casting as a leak at this point will result in poor acceleration

FAST IDLE ADJUSTMENT With choke held in wide open position, lip on fast idle arm should contact boss on body casting Adjust by bending at offset of fast idle link

Lycoming—Carbureters Nos. 2428S-2428SA

SERVICE PROCEDURE

CAUTION REMOVE HIGH SPEED NEEDLE BEFORE REMOVING BOWL

To Disassemble

1. Remove carbureter from engine
2. Remove high speed adjusting needle packing nut and packing (SCRIBE MARK ON BODY AND BOWL)
3. Remove bowl nut gasket and bowl
4. Remove float pin float needle and needle seat Check float for dents leaks and wear on float lip or in float pin holes
5. Remove bowl ring gasket
6. Remove idle adjustment screw and spring
7. Remove nozzle
   DO NOT REMOVE LOW SPEED JET TUBE
8. Remove throttle valve screws valve and shaft and lever assembly
9. Clean all parts with solvent making sure all carbon accumulation is removed from bore especially where throttle valve seats in casting Blow out all passages with compressed air Replace all worn and damaged parts Always use new gaskets

To Assemble

10. Install throttle shaft and valve Valve must be installed with trademark C on side toward idle port when viewing from flange side Always use new screws With valve screws loose and throttle lever set screw backed out seat valve by tapping lightly with a small screwdriver Hold in place while tightening screws
11. Install nozzle making sure it seats in casting
12. Install needle seat needle float and float pin
13. Set float level with carbureter casting inverted float resting lightly against needle in its seat There should be 3/32 inch clearance between outer surface of casting and free end of float (side opposite needle seat) Adjust by bending lip of float
14. Install bowl ring gasket bowl (line up scribe marks) bowl nut gasket and bowl nut Tighten securely
15. Install high speed adjusting needle packing nut and new packing Turn needle in until it just seats in body then back out 1/4 to 3/4 turn
16. Install idle adjusting screw finger tight Back out approximately 1/4 turn Do not use pliers or screwdriver as it may damage idle screw
17. Install carbureter on engine and make idle and high speed adjustment as necessary

PRINTED IN U.S.A.

HIGH SPEED AND IDLE SCREW ADJUSTMENT

After rebuilding and installation on engine is complete, the final high speed and idle screw adjustments must be made Turning the adjustable main metering screw clockwise produces a leaner high speed mixture and turning the idle screw clockwise produces a leaner idle mixture

When adjusting the idle screw, turn approximately 1/8 turn at a time, then wait sufficient time for engine to respond to this adjustment.

Martin—1953—Carbureter No. N-2018S

SERVICE PROCEDURE

To Disassemble

1. Remove carbureter from engine
2. Remove adjustable main metering screw and needle assembly gasket and bowl
3. Remove float pin float needle and needle seat Check float for dents leaks and wear on float lip or in float pin holes
4. Remove bowl ring gasket
5. Remove low speed jet
6. Remove idle adjustment screw and spring
7. Remove nozzle
8. Remove throttle valve screws valve and shaft and lever assembly
9. Do not remove choke valve and shaft unless replacement of these parts is necessary A spring loaded ball retains choke in wide open position Be sure to use a new ball and spring when replacing choke shaft and lever assembly CAUTION Hold a screw driver handle or a small piece of wood over threaded hole in air horn (side opposite choke lever) to prevent the ball from flying out when shaft is removed
10. Clean all parts in clean solvent making sure all carbon accumulation is removed from bore especially where throttle valve seats in casting Blow out all passages with compressed air Replace all worn and damaged parts Always use new gaskets

To Assemble

11. Install throttle shaft and valve Valve must be installed with trademark c on side toward idle port when viewing from flange side Always use new screws With valve screws loose seat valve by tapping lightly with a small screw driver Hold in place while tightening screws
    Note Throttle valve return spring **opens** throttle
12. Install nozzle making sure it seats in casting
13. Install needle seat needle float and float pin
14. Set float level With carbureter casting inverted and free weight of float on seated needle there should be ⅛" (plus or minus 1/64") clearance (use gauge T109 36) between outer surface of casting and free end of float (side opposite needle seat) Adjust by bending lip of float with small screw driver
15. Install bowl ring gasket bowl adjustable main metering screw and needle assembly Before installing adjustable main metering screw and needle assembly back out adjusting screw needle until tip of needle is flush with end of thread then tighten securely after making certain bowl is centered in gasket Turn adjusting screw needle in until it seats then back out one turn Make sure packing nut is tight
16. Install low speed jet
17. Then install idle adjusting screw Turn inward until screw seats then back out one turn

AFB Four-Bore Down-Draft Climatic® Control **Carbureters Nos. 2441S-2441SA**

CARBURETER SPECIFICATIONS

For Mercury 8 Cylinder Engine: 3.80 Inch Bore, 3.44 Inch Stroke

Dimensions: Flange, four bore—4 bolt type.
Throttle bore 1-7/16 inch I. D.
Primary venturi size, 11/32 inch I. D.
Main Venturi 1-1/16 inch I. D.

Vents: Inside (2) in air horn; Outside (4) in body.

Gasoline Intake: Size No. 38 (.1015 inch) drill hole in needle seat.

Low Speed Jet Tube: (In venturi assembly, primary side only).
Jet, size No. 68 (.031 inch) drill.
By-pass, size No. 53 (.0595 inch) drill.
Economizer, size (.049 inch) diameter.
Idle bleed, size No. 51 (.067 inch) drill.

Idle Port: (Upper) slot type. Primary, length .230 inch; width .030 inch. Secondary, none.

Idle Port Opening: Primary, .187 to .193 inch above top edge of valve with valve tightly closed. Secondary, none.

Lower Port: Primary (for idle adjustment screw), size early prod. .0635 inch, intermediate prod. .065 inch, late prod. .076 inch.

Set Idle Adjustment Screw: 1/2 to 1 1/2 turns open. For richer mixture turn screw out. Idle engine between 475 to 500 r.p.m. (all trans.) in neutral.

Main Nozzle: Installed permanently. DO NOT REMOVE. Anti-percolator bleed, primary, (tube in venturi assembly) size No. 71 (.026 inch) drill. Secondary, (drilled hole in venturi assembly) size No. 60 (.040 inch) drill.

Step-Up Rod: (Vacumeter type) see parts list for size.

Metering Jet: Primary, size .0935 inch diameter (for step-up rod).
Secondary, size .0635 inch diameter (no step-up rod).

Accelerating Pump: Discharge jet (twin) primary side only, size No. 68 (.031 inch) drill. Intake ball check seat (screw plug) size .115 to .120 inch diameter. Discharge needle seat, size .070 inch diameter.

Choke: Carter Climatic® Control set 1 point rich. Butterfly type—offset choke valve, primary side only. Choke heat suction hole, restriction in body size No. 38 (.1015 inch), late prod. No. 44 (.086 inch) drill.

Vacuum Spark Port: Horizontal slot (round end) .055 x .130 inch. Top of port .040 to .050 inch above top edge of valve with valve tightly closed.

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3692

FLOAT ALIGNMENT: Side of floats parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding. To adjust, bend float lever.

FLOAT LEVEL: 5/32 inch (Gauge T109-154) between top of floats at outer end and air horn gasket. To adjust, bend float lever.

FLOAT DROP: 23/32 inch between top of floats at outer end and air horn gasket. To adjust, bend stop tabs on floats brackets.

PUMP: 15/32 inch from the top of the bowl cover to the top of the plunger shaft with throttle connector rod in center hole (medium stroke) of pump arm.

COUNTERSHAFT LINKAGE: (1) .086 inch (Gauge T109-215) between choke lever and stop in piston housing with choke held closed. To adjust, take slack out of linkage by setting counter shaft lever.

(2) .010 inch (Gauge T109-200) between lug on outer countershaft lever and stop on inner countershaft lever. To adjust, bend lug on outer countershaft lever.

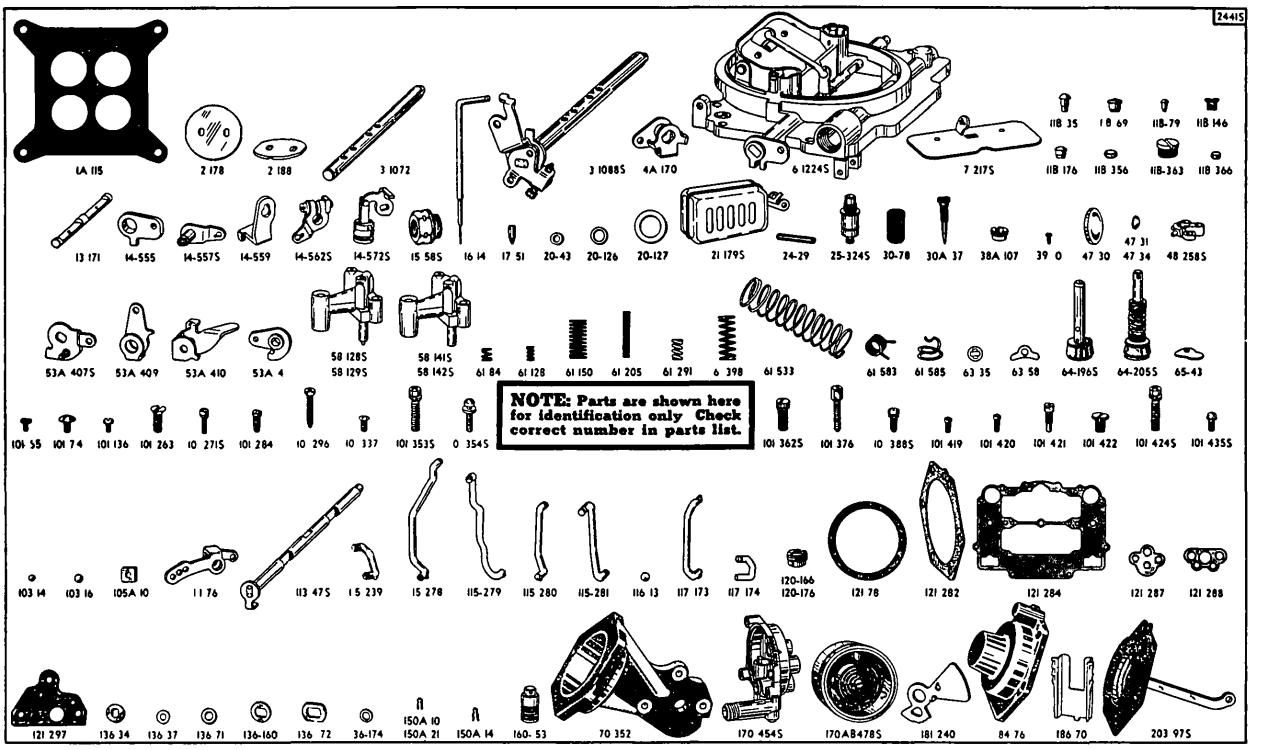
Optional adjustment (late prod.) with slight clearance between lug on fast idle cam and stop on flange casting, and inner countershaft lever contacting lug on outer countershaft lever align index mark on cam with adjusting screw. To adjust bend fast idle connector rod.

FAST IDLE THROTTLE VALVE CLEARANCE: .020 inch (Gauge T109-29) between lower edge of valve and bore with adjusting screw on high step of cam.

FAST IDLE ON CAR: 1800 to 2000 R.P.M. hot engine —with fast idle screw on high step of cam.

UNLOADER: .067 inch (Gauge T109-234) between upper edge of choke valve and inner wall of air horn. To adjust, bend unloader arm on throttle lever.

PRIMARY THROTTLE SHAFT DOG: (1) With primary throttle valves in wide open position there should be .015 inch (Gauge T109-44) clearance between edge of secondary valves and bore of carbureter adjacent to primary valves. To adjust, bend upper tang on primary throttle shaft dog. If clearance cannot be obtained, bend throttle operating rod slightly.



(2) With primary and secondary valves tightly closed there should be .067 inch (Gauge T109-234) clearance between primary throttle shaft flex spring and lower tang on primary throttle shaft dog. To adjust, bend lower tang.

DASH POT: 7/16 inch from top of the bowl cover to the top of the plunger shaft with primary throttle wide open. To adjust, bend stop lug on flat lever.

TOOLS REQUIRED FOR SERVICING CARBURETER:

T109-29	.020" Wire gauge	T109-234	.067" Wire gauge
T109-44	.015" Wire gauge	T109-22	Bending tool
T109-154	5/32" Float gauge	T109-213	Bending tool
T109-200	.010" Wire gauge	T109-214	Bending tool
T109-215	.086" Wire gauge

WHEN SERVICING, USE GASKET ASSORTMENT No. 292; REPAIR PACKAGE No 1851

PART NAMES IN CAPITAL LETTERS, LISTED BELOW, INDICATE CONTENTS OF REPAIR PACKAGE

Part No.	PART NAME	
1A-115	FLANGE GASKET	
2-178	Secondary throttle valve	(2)
2-188	Primary throttle valve	(2)
3-1072	Secondary throttle shaft	
3-1088S	Primary throttle shaft and lever assembly	
4A-170	Primary throttle shaft dog	
6-1224S	†Air horn assembly (2441S) (Sup by 6 1304S)	
6-1304S	Air horn assembly	
7 217S	Choke valve and lever assembly	
11B-35	Rivet plug	
11B-69	Fuel passage plug (Sup by 11B 306)	
11B-79	Rivet plug	(2)
11B-146	Level sight plug (Sup by 11B 372)	
11B-176	Idle port rivet plug	(2)
11B-306	Fuel passage plug	
11B-356	Secondary throttle shaft plug	
11B-363	PUMP INTAKE SCREW PLUG	
11B-366	Nozzle well rivet plug	(4)
11B-372	Level sight plug	(2)
13-171	Choke shaft	
14-555	Inside countershaft lever	
14-557S	Choke lever and shaft assembly (piston housing)	
14-559	Countershaft lever (to choke valve)	
14-562S	Countershaft lever screw and nut assembly	
14-572S	Choke piston lever link and pin assembly (Sup by 14 581S 150 190 160 166)	
14-581S	Choke piston link and lever assembly	
15-58S	Fuel inlet fitting assembly	

Part No.	PART NAME	
16-14	Step up rod 0725" x 063" (Sup by 16 28)	(2)
16-21	Step up rod 0725" x 066" 1 size lean	(2)
16-22	Step up rod 07375" x 068" 2 sizes lean	(2)
16-28	STEP UP ROD 071" x 0635"	(2)
16-53U	Step up rod and jet unit (consists of 2—16 22 and 2—120 186) (for altitude use)	
17-51	PUMP DISCHARGE CHECK NEEDLE	
20-43	PISTON HOUSING GASKET	
20-126	Needle seat gasket	(2)
20-127	FUEL INLET FITTING GASKET	
21-179S	Float and lever assembly	(2)
24-29	Float lever pin	(2)
25-324S	NEEDLE AND SEAT ASSEMBLY	(2)
30-78	FUEL INLET STRAINER	
30A-37	Idle adjustment screw	(2)
38A-107	PUMP INTAKE CHECK BALL SEAT	
39-10	Choke valve attaching screw	(2)
47-30	Piston housing welsh plug	
47-31	Venturi welsh plug (Sup by 47 33)	(4)
47-33	Venturi welsh plug	(4)
47-34	Spark port welsh plug	
48-258S	Pump jet housing	
53A-407S	Secondary throttle operating lever assembly	
53A-409	Primary throttle operating lever	
53A-410	Dash pot arm (inner)	
53A-411	Dash pot arm (outer)	
58-128S	†Primary venturi assembly (choke side) (2441S) (Sup by 58 170S and 6 1304S)	
58-129S	†Primary venturi assembly (pump side) (2441S) (Sup by 58 171S and 6 1304S)	
58-141S	Secondary venturi assembly (pump side)	

Part N .	PART NAME	
58-142S	Secondary venturi assembly (choke side)	
58-170S	Primary venturi assembly (choke side) (Sup by 58 179S)	
58-171S	Primary venturi assembly (pump side) (Sup by 58 180S)	
58-179S	Primary venturi assembly (choke side)	
58-180S	Primary venturi assembly (pump side)	
61-84	Idle adjustment screw spring	(2)
61-128	THROTTLE CONNECTOR ROD SPRING (Use with 115 278)	
61-150	DASH POT RETURN SPRING	
61-205	Vacuum piston spring (Sup by 61 259)	(2)
61-259	VACUUM PISTON SPRING	(2)
61-291	Throttle lever adjusting screw spring	
61-398	PUMP SPRING	
61-533	Diaphragm return spring	
61-583	Throttle flex spring	
61-585	STEP UP ROD RETAINING SPRING	(2)
63-35	THROTTLE CONNECTOR ROD RETAINER (Use with 115 278)	
63-58	Coil housing retainer	(3)
64-196S	DASH POT PLUNGER ROD AND CHECK ASSEMBLY	
64-205S	PUMP PLUNGER ROD AND SPRING ASSEMBLY	
65-43	Step up piston cover plate	(2)
101-65	Piston housing choke shaft lever attaching screw	
101-74	Throttle shaft lever attaching screw	(2)
101-136	Coil housing attaching screw	(3)
101-184S	Pump jet housing attaching screw and washer assembly	(2)
101-263	Diaphragm housing attaching screw	(3)
101-271S	Pump jet housing attaching screw and washer assembly (Sup by 101 184S)	(2)
101-284	Piston housing attaching screw (Sup by 101 436)	(3)
101-296	Fast idle adjustment screw	
101-337	Countershaft lever attaching screw	
101-353S	Air horn attaching screw and washer assembly	(2)
101 354S	Countershaft lever clamp screw and washer assembly	
101-362S	Air horn attaching screw and washer assembly	(8)
101-376	Throttle lever adjusting screw	
101-388S	Diaphragm housing cover attaching screw and washer assembly	(6)
101 419	Secondary throttle valve attaching screw	(4)
101-420	Primary throttle valve attaching screw	(4)
101-421	Pump arm attaching screw	
101-422	Fast idle cam attaching screw	
101-424S	Venturi attaching screw and washer assembly	(8)

Part No.	PART NAME	
101-435S	Step up piston cover plate attaching screw and washer assembly	(2)
101-436	Piston housing attaching screw	(3)
103-14	Lead shot	
103-16	Lead shot	(2)
105A-10	Countershaft lever clamp screw nut	
111-76	Pump arm	
113-47S	Countershaft and lever assembly	
115-239	Throttle operating rod (Sup by 115 309)	
115-278	THROTTLE CONNECTOR ROD (Sup by 115 298 and 172 22)	
115-279	Choke connector rod	
115-280	Fast idle connector rod	
115-281	Dash pot connector rod	
115-298	Throttle connector rod	
115-309	Throttle operating rod	
116 13	PUMP INTAKE CHECK BALL	
117-173	Choke valve connector link	
117-174	PUMP CONNECTOR LINK	
120-166	PRIMARY METERING JET	(2)
120-176	SECONDARY METERING JET	(2)
121-78	COIL HOUSING GASKET	
121-282	GASKET (DIAPHRAGM TO LOWER HOUSING)	
121-284	AIR HORN GASKET	
121-287	PUMP JET HOUSING GASKET	
121-288	VENTURI CLUSTER GASKET	(4)
121-297	DIAPHRAGM HOUSING TO FLANGE GASKET	
136-34	Choke piston lever retaining washer	
136-37	Throttle operating rod washer (Use with 115 239)	(4)
136-71	Dash pot lever retaining washer	
136-160	Secondary throttle shaft washer	
136-172	Primary throttle shaft washer	
136-174	Throttle lever adjusting screw washer	
150-190	Choke piston pin (Use with 14 581S)	
150A-10	PIN SPRING	(7)
150A-14	PIN SPRING	
150A 21	Step up piston	(2)
156 118	Spark fitting	
160-153	PIN SPRING	
160 166	Choke piston (Use with 14 581S)	
170 352	Diaphragm housing	
170-454S	Piston housing and plug assembly	
170AB-478S	Thermostatic coil and housing assembly	
172-22	Throttle connector rod retainer (Use with 115 298)	
181 240	Fast idle cam	
184-76	Diaphragm housing cap	
186-70	Fuel bowl baffle	(2)
203-97S	Secondary throttle shaft diaphragm assembly	

† 244 1S used on l mited production

NOTE Figures in parentheses indicate number of pieces used in one carburetor Where no figure s shown only one is used

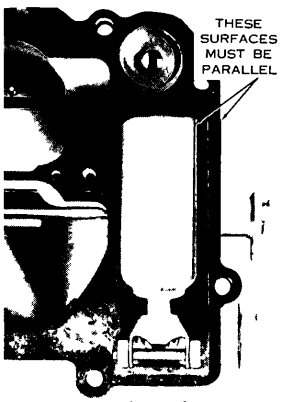
File Under Mercury

CARTER MODEL AFB CARBURETOR FOR MERCURY (SERVICE ADJUSTMENT PROCEDURE)

NOTE: The parts and specification pages referred to are catalog pages. These pages can be obtained from Carter-Carburetor, Catalog Department, St. Louis (7), Missouri. Specify the carbureter number found on the base of carbureter, when requesting specification pages.



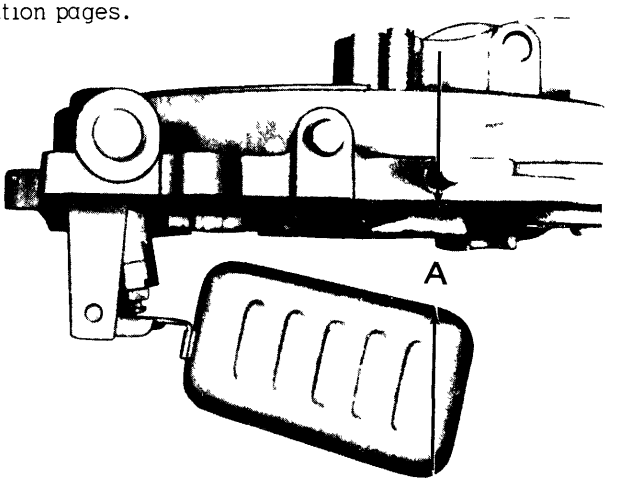


Figure 1 Left

Figure 1 Right

FLOAT ALIGNMENT ADJUSTMENT (Fig. 1):

1. Sight down the side of the float shell to determine if the side of the float is parallel to the outer edge of the air horn casting. TO ADJUST: Bend float lever by applying pressure to the end of the float shell with the fingers while supporting the float lever with the thumb.

CAUTION: To avoid damaging the float, apply only enough pressure to bend float lever.

2. After aligning float, remove as much clearance as possible between arms of float lever and lugs on air horn by bending the float lever. Arms of float lever should be as parallel to the inner surfaces of lugs on air horn as possible.

   Floats must operate freely without excess clearance on its hinge pin.

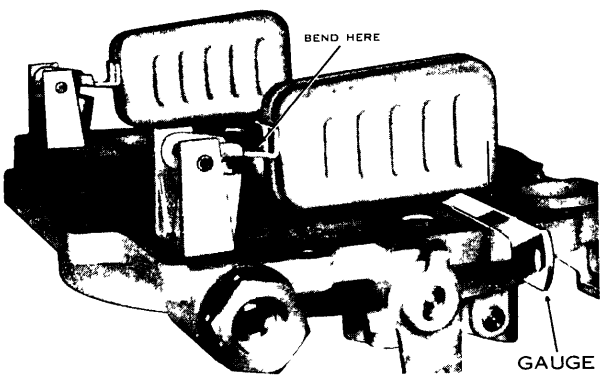

Figure 2

FLOAT LEVEL ADJUSTMENT (Fig. 2):

With air horn inverted, bowl cover gasket in place and needle seated, there should be the clearance as listed on carburetor specification page between outer end of float and air horn gasket. To adjust, bend float arm. Adjust both floats. Recheck float alignment.

FLOAT DROP ADJUSTMENT (Fig. 3):

With bowl cover held in upright position and measuring from outer end of float, the distance (A) between top of floats and bowl cover gasket should be as listed on specification page. To adjust, bend stop tabs on float brackets.

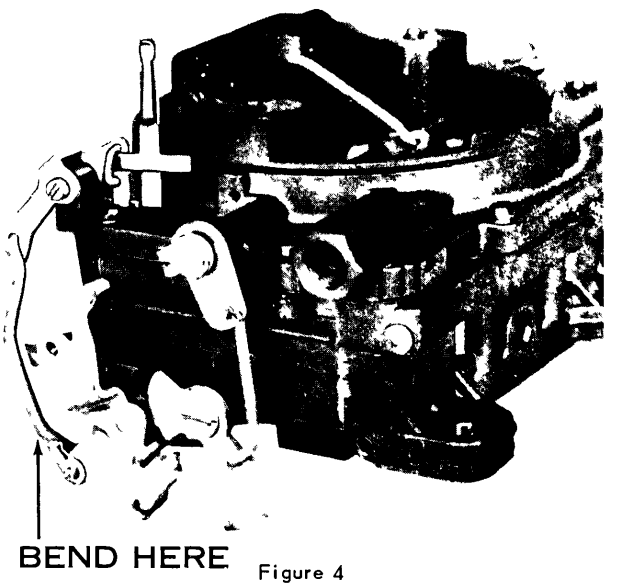

Figure 4

PUMP ADJUSTMENT (Fig. 4):

1. Back out idle speed screw until throttle valves seat in bores of carburetor. NOTE: Be sure choke is wide open so fast idle cam does not hold throttle valve open.
2. With throttle connector rod in inner hole (long stroke) of pump arm, the distance from the top of the bowl cover to the top of the plunger shaft should be as specified on carburetor specification page.
3. Adjust by bending throttle connector rod at lower angle (use tool T109-213).

MARCA REGISTRADA

PRINTED IN U.S.A.

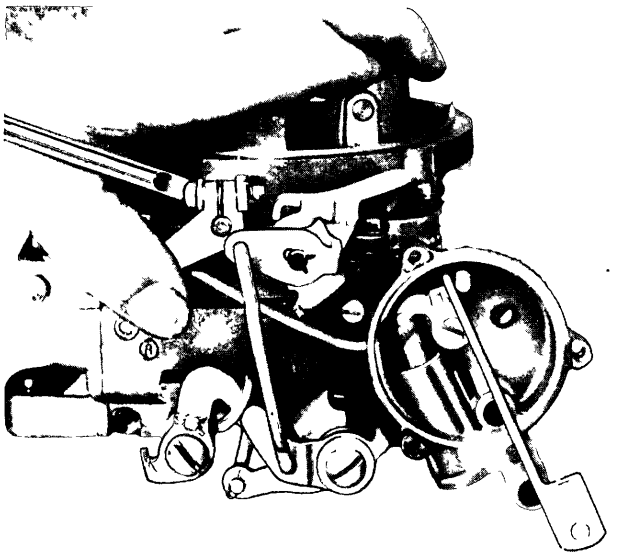

Figure 5

CHOKE PISTON LEVER ADJUSTMENT (Fig. 5):

L osen countershaft lever clamp screw. Take end play out of count rshaft, and hold choke valve tightly closed. Take slack out of linkage by pressing countershaft lever towards closed position with gauge in place between choke lever and stop in piston housing. Hold in plac and tighten clamp screw.

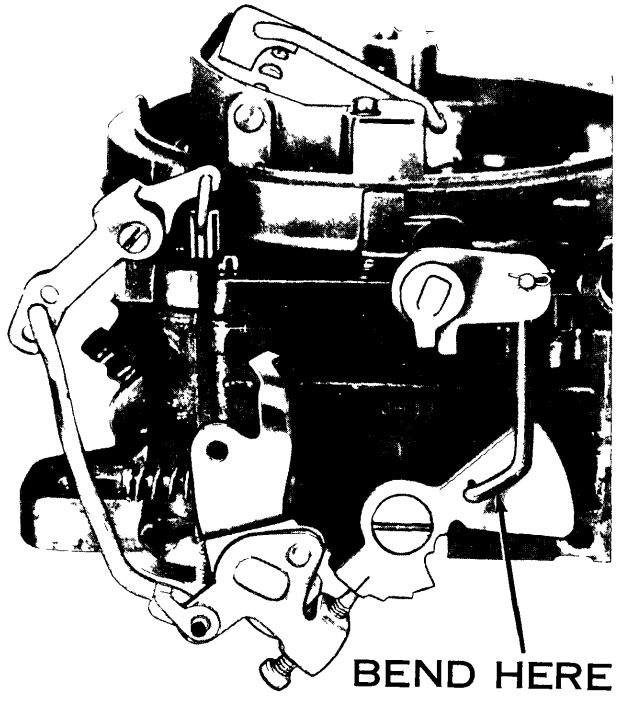

Figure 6

FAST IDLE LINKAGE ADJUSTMENT (Fig. 6):

With choke valve tightly closed and lug on outer choke shaft lever contacting stop on inner choke shaft lever align center of fast idle scr w with index mark on cam. To adjust, bend fast idle connector rod. (Use tool T109-213).

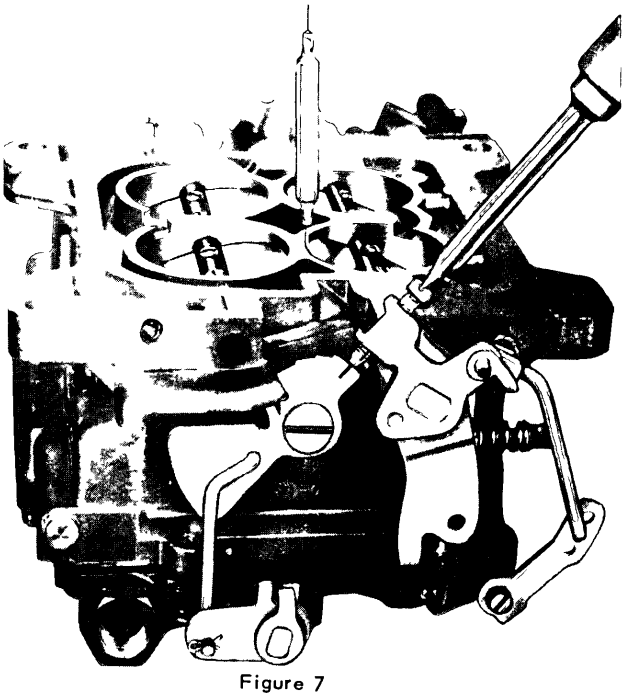

Figure 7

FAST IDLE THROTTLE VALVE CLEARANCE ADJUSTMENT (Fig. 7):

With choke valve tightly closed, tighten fast idle adjusting screw (on index mark of cam) until the clearance between throttle valve and bore of carbureter, side opposite idle port, is as listed on carbureter specification page.

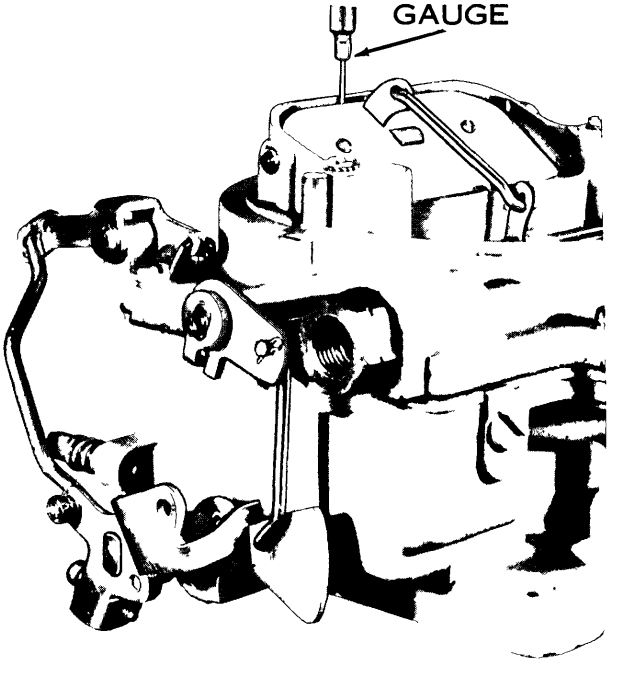

Figure 8

UNLOADER ADJUSTMENT (Fig. 8):

With throttl wide open ther should be the cl arance as listed on carbureter specification pag between upper edge of choke valve and inner wall of air horn. To adjust, bend unloader lip on throttle shaft lever. (Us tool T109-214).

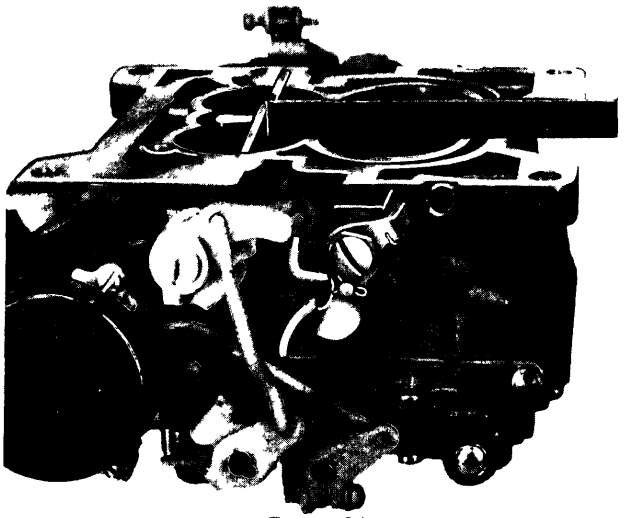

Figure 9A

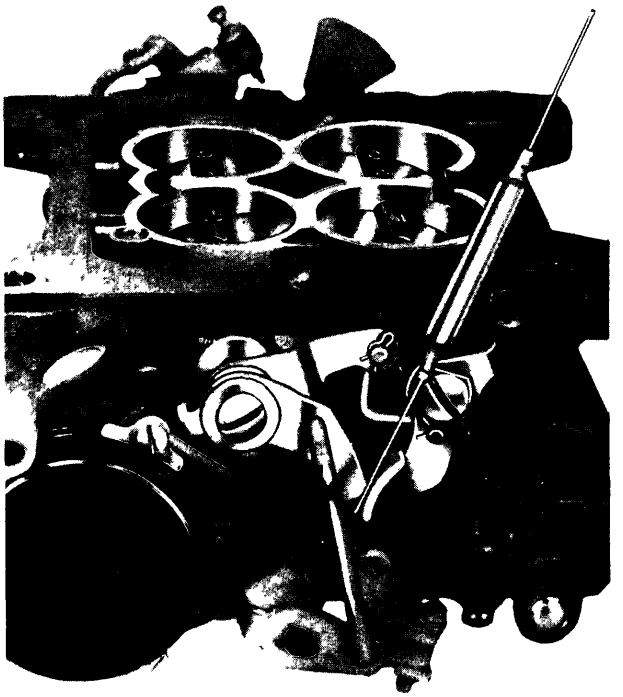

Figure 9B

SECONDARY THROTTLE LEVER ADJUSTMENT (Figs. 9A and 9B):

1. Block choke valve wide open.
2. Secondary throttle valves should just start to open when primary throttle valves are opened to the clearance as listed on specification page between lower edge of valve and bore (opposite idle port). To adjust, bend throttle operating rod. (Use bending tool T109-213). (See Fig. 9A) NOTE: Primary and secondary throttle valves should reach wide open position, full vertical, at the same time.
3. With primary and secondary throttle valves in tightly closed position, there should be the clearance as listed on specification page between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever. (See Fig. 9B).

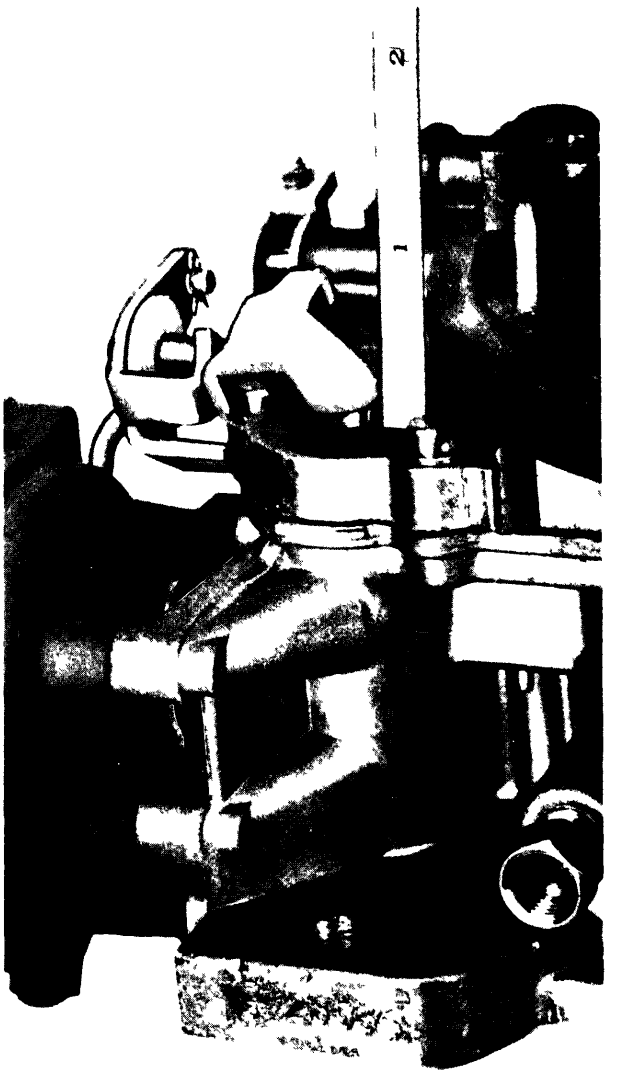

Figure 10

DASH POT ADJUSTMENT (Fig. 10):

1. With primary valves tightly closed there should be the distance as listed on specification page between the top surface of the bowl cover and the top of the plunger shaft. To adjust, bend the flat portion of the dash pot lever. Check to be sure dash pot lever does not contact bowl cover attaching screw.
2. With primary valves wide open there should be the distance as listed on specification page between the top surface of the bowl cover and the top of the plunger shaft. To adjust, bend stop lug on dash pot lever. (Use bending tool T109-22). Check to be sure plunger shaft operates without sticking in hole in bowl cover.

NOTE: See last page for pertinent service information.

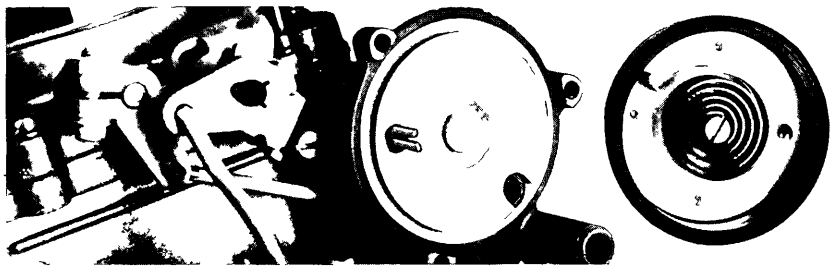

Figure 11

FIGURE 11:

After chok baffle plat assembly has be n properly installed as shown in Fig. 11 install gasket and coil housing with the lip on the coil spring installed in the slot of the piston lever.

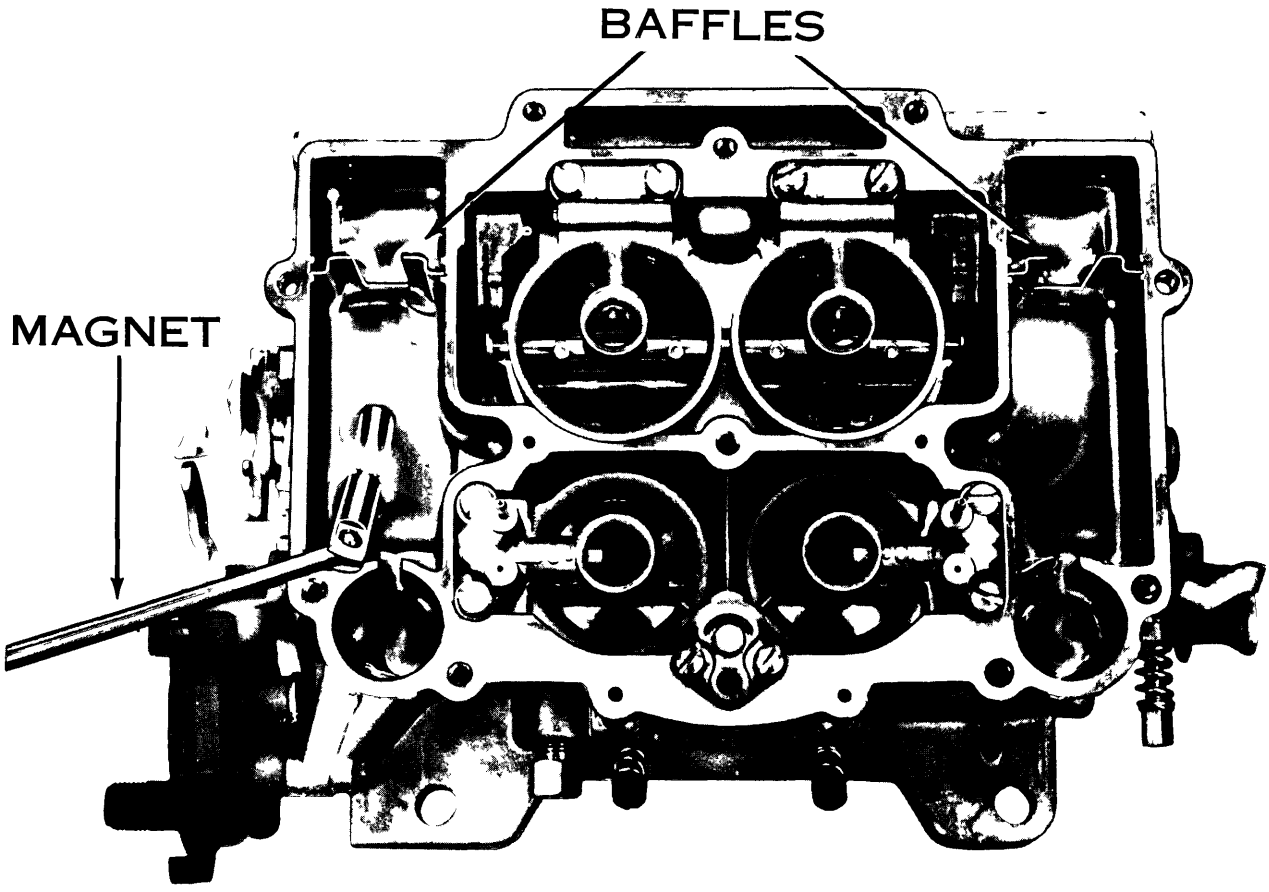

Figure 12

FIGURE 12:

Flooding, stumble on acceleration and other performance complaints are, in many instances, caused by the presence of dirt, water or other foreign matter in the carbureter. To aid in diagnosing the cause of the complaint, the carbureter should be car fully removed from the engine without draining the fuel from the bowl. The contents of the fuel bowl may then be examined for contamination as the carbureter is disassembled.

Check th fuel in the bowl for contamination by dirt, water, gum or other foreign matter. A magnet moved through the fuel in the bowl will pick up and identify any iron oxide dust that may have caused intake needle and seat leakage.

Inspect gasketed surfaces between body and air horn. Small nicks or burrs should be smoothed down to eliminate air or fuel leakage. Be especially particular when inspecting the top surface of the inner wall of the bowl around the vacuum piston passage. A poor seal at this location may contribute to a "cutting-out" on turns complaint.

Install fuel baffles as shown (Fig. 12) to prevent damage of floats.

Fill the carbureter bowl with clean fuel before installing on th manifold. This will help prevent dirt trapped in th fuel syst m from being dislodged by the fr e flow of fuel as the carbur t r is primed. Th operation of the floats and intake needle and seats may be checked under pressure if a fuel pump is used at the bench to fill the carbur t r bowl. Op rate the throttle several times and visually check th discharge from the pump jets.

Before installing the carbureter, hold choke valve open and turn th idle spe d screw until it just contacts th throttl lever, then ½ a turn more to open th throttl valves enough to keep th engine running, until th idle mixture and final R.P.M. adjustment can be made.

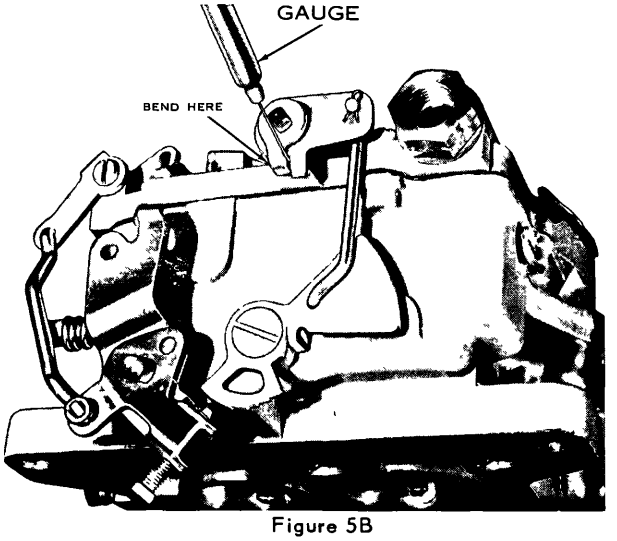

Figure 5B

FAST IDLE THROTTLE VALVE CLEARANCE ADJUSTMENT (Fig. 6):

With choke valve tightly closed, tighten fast idle adjusting screw (on high step of cam) until there is the clearance as listed on carburetor specification page between throttle valve and bore of carburetor, side opposite idle port.

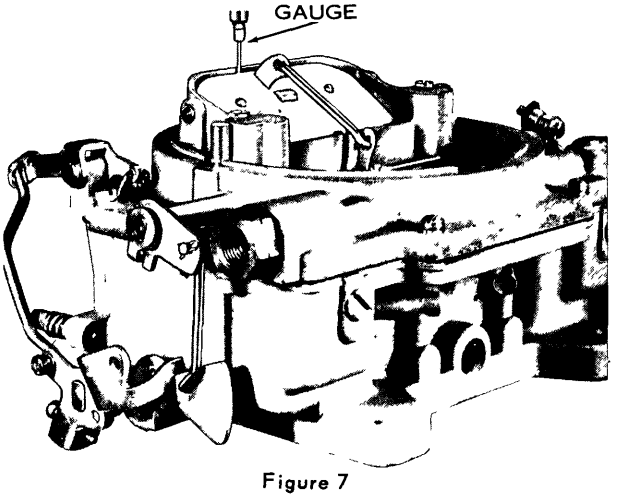

Figure 7

COUNTERSHAFT LINKAGE ADJUSTMENT (Figs. 5A & 5B):

1. Loosen countershaft lever clamp screw. Take end play out of countershaft, and hold choke valve tightly closed. Take slack out of linkage by pressing countershaft lever towards closed position with gauge in place b tween choke lever and stop in piston housing. Hold in place and tighten clamp screw. (Fig. 5A)
2. A. Hold choke valve tighly closed.
   B. Hold fast idle cam against stop on casting.
   C. Th cl arance betwe n lug on outer countershaft lever and stop on inner countershaft lever should be as listed on carbur tor sp cification page. TO ADJUST: Bend lug on outer countershaft lev r. (Use tool T109-214) (Fig. 5B)

UNLOADER ADJUSTMENT (Fig. 7):

With throttle wide open there should be the clearance as listed on carburetor sp cification pag b tw n upp r dge of choke valv and inn r wall of air horn. To adjust, b nd unload r lip on throttl shaft l v r. (Use tool T109-214)

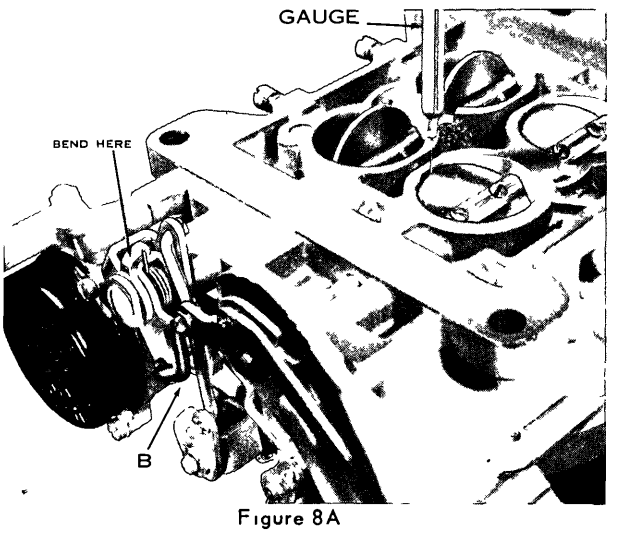

Figure 8A

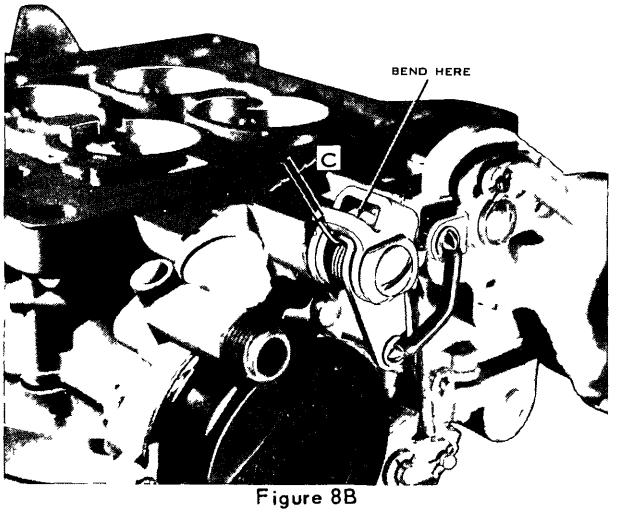

Figure 8B

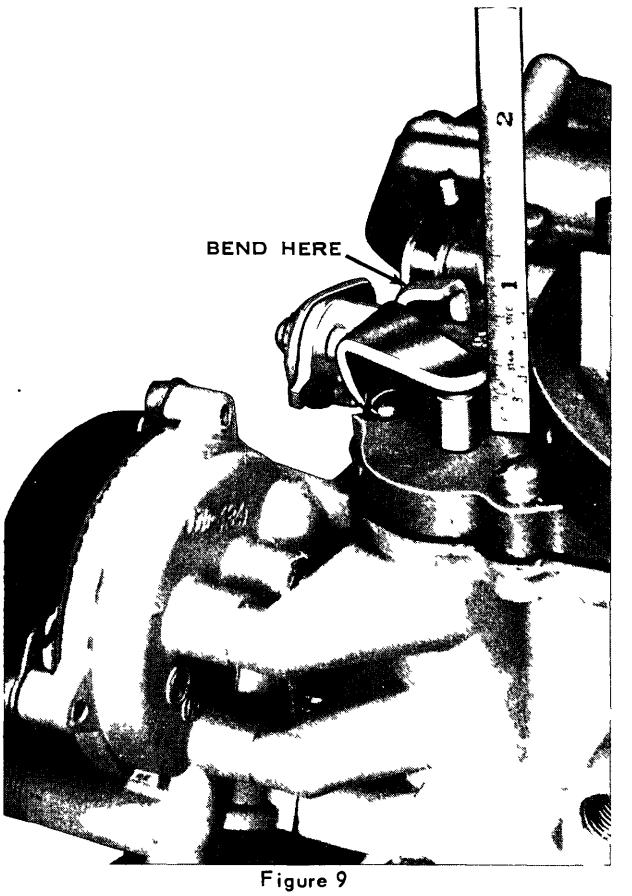

Figure 9

DASH POT ADJUSTMENT (Fig. 9):

With primary throttle valves in wide open position ther should be the distance as listed on specification page between the top surface of the bowl cover and th top of the plunger shaft. To adjust, bend lug. (Use bending tool T109-22)

PRIMARY THROTTLE SHAFT DOG ADJUSTMENT (Figs. 8A & 8B):

1. With primary throttle valves in wide open position there should be the clearance as listed on specification page between edge of secondary valves and bore of carburetor adjacent to primary valves. To adjust, bend tang. (Use bending tool T109-213). If proper clearance between secondary valves and bore cannot be obtained, bend throttle operating rod (B) (Fig. 8A).

2. With primary and secondary throttle valves in tightly closed position there should be the clearance (C) between primary throttle shaft flex spring and tang as listed on specification page. To adjust, bend tang. (Use bending tool T109-213) (Fig. 8B)

NOTE: See last page for pertinent service information.

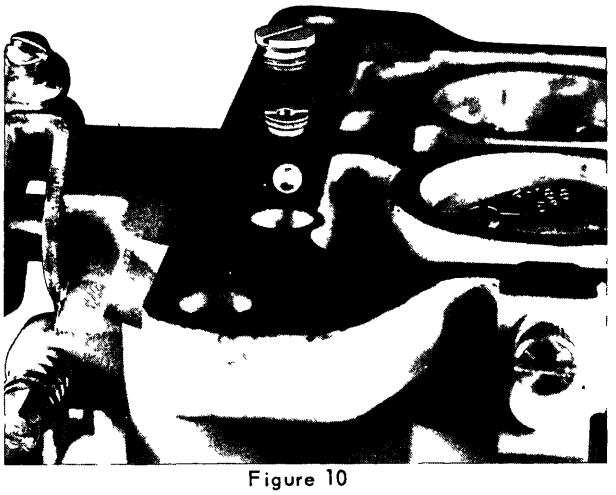

Figure 10

(Fig. 10)

Pump intake check ball, seat and screw plug are removed by inverting carbureter and removing from lower side of flange.

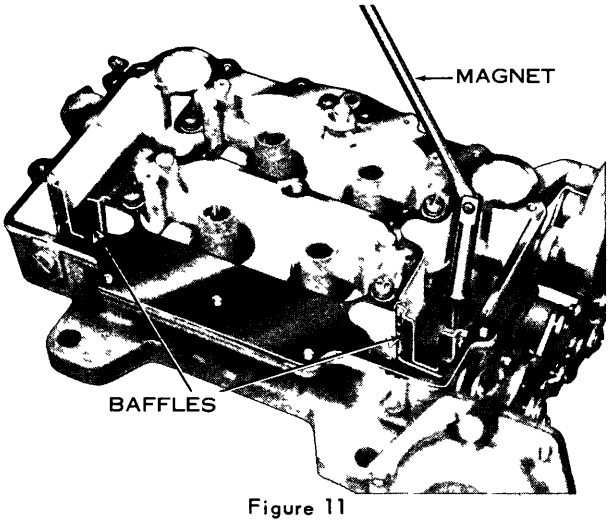

Figure 11

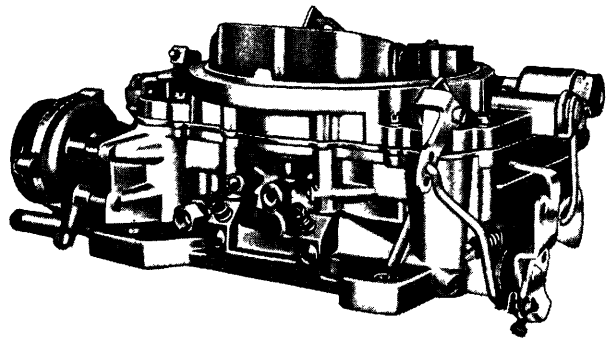
(Fig. 11)

Flooding, stumble on acceleration and other performance complaints are, in many instances, caused by the presence of dirt, water or other foreign matter in the carbureter. To aid in diagnosing the cause of the complaint, the carbureter should be carefully removed from the engine without draining the fuel from the bowl. The contents of the fuel bowl may then be examined for contamination as the carbureter is disassembled.



Check the fuel in the bowl for contamination by dirt, water, gum or other foreign matter. A magnet moved through the fuel in the bowl will pick up and identify any iron oxide dust that may have caused intake needle and seat leakage. (See Fig.11.)

Inspect gasketed surfaces between body and air horn. Small nicks or burrs should be smoothed down to eliminate air or fuel leakage. Be especially particular when inspecting the top surface of the inner wall of the bowl around the vacuum piston passage. A poor seal at this location may contribute to a "cutting-out" on turns complaint.

Install fuel baffles as shown (Fig. 11) to prevent damage to floats.

Fill the carbureter bowl with clean fuel before installing on the manifold. This will help prevent dirt trapped in the fuel system from being dislodged by the free flow of fuel as the carbureter is primed. The operation of the floats and intake needle and seats may be checked under pressure if a fuel pump is used at the bench to fill the carbureter bowl. Operate the throttle sev ral times and visually check the discharge from the pump jets.

Before installing the carbureter, hold choke valve open and turn the idle speed screw until it just contacts the throttle lever, then 1/2 of a turn more to open the throttle valves enough to keep the engine running until the idle mixture and final R.P.M. adjustment can be made.

AFB Four-Bore Down-Draft Climatic® Control **Carbureter No. 2853S**

CARBURETER SPECIFICATIONS

For Mercury 8 Cylinder 430 Cu. In. Engine· Vacuum at Idle 17-18 Inches

Dimensions: Flange four bore—4 bolt type
Throttle bore primary 1 9/16 inch, secondary 1 11/16 inch I D
Primary venturi size primary side, 7/16 inch secondary 11/32 inch I D
Main venturi size primary side 1-3/16 inch secondary side 1 9/16 inch I D

Vents: Inside (2) in air horn Outside (2) in air horn

Low Speed Circuit: (Primary side only)
Jet size No 67 (.032 inch) drill
By-pass size .057 inch diameter
Economizer size No 56 (.0465 inch) drill
Idle bleed size No 54 (.055 inch) drill
Idle port slot type length .220 inch width .030 inch

Idle Port Opening: .152 to .158 inch above top edge of valve with valve tightly closed

Lower Port: (For idle adjustment screw), size .0635 inch diameter

Set Idle Adjustment Screw: 1½ to 2½ turns open For richer mixture turn screw out Idle engine at 450 R P M for Auto Trans in Drive Range

Main Nozzle Installed permanently DO NOT REMOVE Anti percolator bleed primary (tube in venturi assembly) size No 70 (.028 inch) drill Secondary (drilled hole in venturi assembly) size No 57 (.043 inch) drill
Under strut bleed primary side only, size No 42 (.0935 inch) drill

Main Vent Tube. (In venturi assembly) Side holes primary 1—size No 40 (.060 inch) drill secondary no side holes

Secondary Initial Discharge: (In venturi assembly secondary side only)
Pick up tube size No 56 (.0465 inch) drill
Air bleed size No 60 (.040 inch) drill
Discharge port (upper) size No 53 (.0595 inch) (lower) size No 60 (.040 inch) drill

Accelerating Pump Discharge jet (twin) primary side only size No 70 (.028 inch) drill Intake disc check (screw plug) size 115 to 120 inch diameter Disc check bleed size .016" to .020" Discharge needle seat size .070 inch diameter

Choke· Carter Climatic® Control set on index Butterfly type—offset choke valve primary side only Choke heat suction hole restriction in body size No 45 (.082 inch) drill

Vacuum Spark Port: Horizontal slot (round end) .055 x .130 inch Top of port .015 to .025 inch above top edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap	Breaker Point Setting	Ignition Timing	Float Setting	Idle Adjustment Screw Setting

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3781

FLOAT ALIGNMENT: Side of floats, parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding. To adjust, bend float lever.

FLOAT LEVEL: 3/16 inch (Gauge T109-28) plus or minus 1/64 inch between top of floats at outer end and air horn gasket. To adjust, bend float lever.

FLOAT DROP: 23/32 inch plus or minus 1/16 inch between top of floats at outer end and air horn gasket. To adjust, bend stop tabs on float brackets.

PUMP: 17/32 inch from the top of the bowl cover to the top of the plunger shaft with throttle connector rod in inner hole (long stroke) of pump arm.

CHOKE PISTON LEVER ADJUSTMENT: 3/32 inch (Gauge T109-125) between choke lever and stop in piston housing with choke held closed. To adjust, take slack out of linkage by setting counter shaft lever.

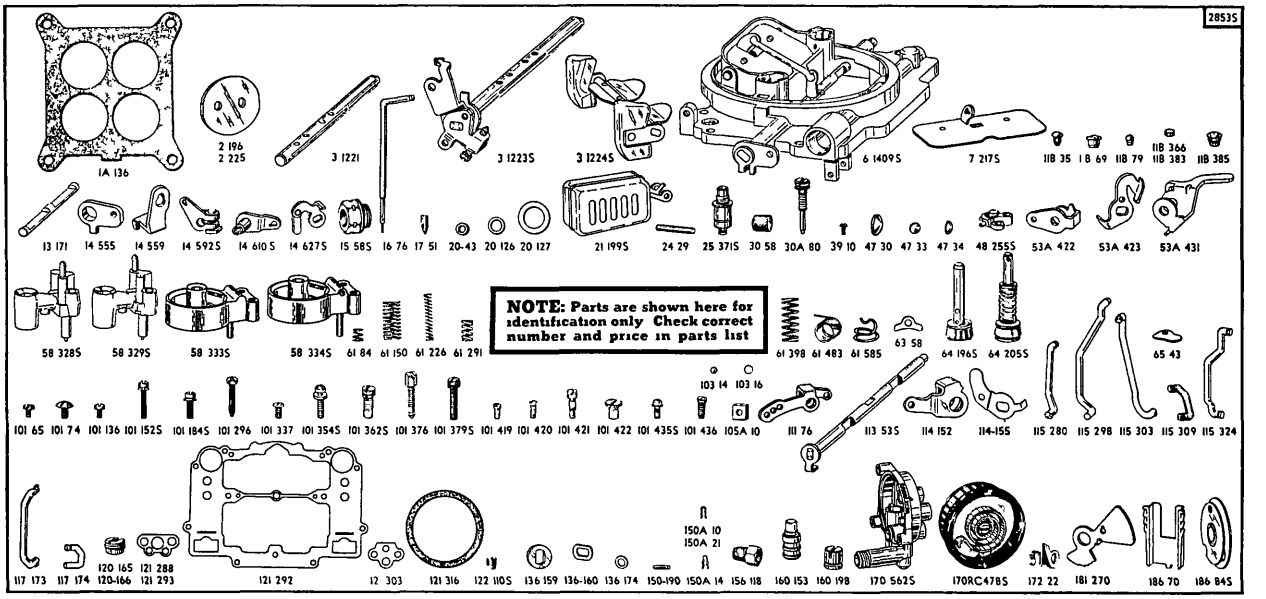
FAST IDLE LINKAGE ADJUSTMENT: With slight clearance between lug on fast idle cam and stop on flange casting, and inner countershaft lever contacting lug on outer conutershaft lever align index mark on cam with adjusting screw. To adjust, bend fast idle connector rod. It may be necessary to bend stop lug on fast idle cam.

FAST IDLE THROTTLE VALVE CLEARANCE: .030 inch (Gauge T109-29) between lower edge of valve and bore with adjusting screw on index mark of cam.

FAST IDLE ON CAR: 550 R.P.M. hot engine—with fast idle screw on lowest (last) step of cam.

UNLOADER: 1/8 inch (Gauge T109-36) between upper edge of choke valve and inner wall of air horn. To adjust, bend unloader arm on throttle lever.

SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Block choke valve wide open. 2. with 15/32 inch between lower edge of primary valve and bore (opposite idle port) secondary valves should just start to open. To adjust, bend throttle operating rod. NOTE: At wide open throttle primary and secondary valves will reach vertical position. 3. With primary and secondary throttle valves in tightly closed position there should be .010" to .030" (Gauge T109-29) between positive closing secondary shoe and cam on primary throttle lever. To adjust, bend shoe on secondary lever.



DASH POT: 1. 1/8 inch from the top of the bowl cover to the top of the plunger shaft with primary valves tightly closed. To adjust, bend the flat portion of the dash pot lever. Check to be sure dash pot lever does not contact bowl cover attaching screw. 2. 7/16 inch from the top of the bowl cover to the top of the plunger shaft with primary valves wide open. To adjust, bend stop lug on flat lever. Check to be sure plunger shaft operates without sticking in hole in bowl cover.

TOOLS REQUIRED FOR SERVICING CARBURETERS

T109-28	3/16" Float gauge	T109-22	Bending Tool
T109-29	.020" Wire gauge	T109-213	Bending Tool
T109-36	1/8" Unloader gauge	T109-214	Bending Tool

T109-125 3/32" Unloader gauge (Used for choke piston lever adj.)

WCFB Four-Bore Down-Draft Climatic® Control **Carbureters Nos. 2361S-2361SA**

CARBURETER SPECIFICATIONS

For Mercury 8 Cylinder Engine 3.80 Inch Bore, 3.44 Inch Stroke

Dimensions Flange size 1¼ inch Four Bore—4 bolt type Primary venturi size 11/32 inch I D Main venturi (primary) size 1 1/16 inch Main venturi (secondary) size 15/16 inch I D

Vents Outside none Inside (2) on primary side (3) on secondary side

Gasoline Intake Size No 38 (1015 inch) drill hole in needle seat

Low Speed Jet Tube (Primary side only) Jet size No 69 (0292 inch) drill
By Pass in body size No 46 (081 inch) drill
Economizer in body size (0492 inch) diameter
Idle Bleed in body size No 56 (0465 inch) drill

Idle Port (Upper) slot type Primary length 175 inch width 030 inch Secondary none

Idle Port Opening Primary 107 to 113 inch above top edge of valve with valve tightly closed Secondary none

Lower Port Primary (for idle adjustment screw) size No 53 (0595 inch) drill Secondary none

Set Idle Adjustment Screw ¾ to 1¾ turns open For richer mixture turn screw out Idle engine between 425 and 450 r p m (In Drive Range)

Main Nozzle Installed permanently DO NOT REMOVE Anti-percolating well restriction (primary in plug) size No 67 (032 inch) drill (secondary in body) size No 65 (035 inch) drill

Metering Rod Primary economy step 071 inch diameter Middle step tapers to 057 inch diameter Power step 057 inch diameter Secondary none

Metering Rod Jet Primary size 0935 inch diameter (for metering rod)
Secondary size 057 inch diameter (no metering rod)

Accelerating Pump Discharge jet (twin) primary side only, size No 67 (032 inch) drill Intake ball check seat size 115 to 120 inch diameter Discharge needle seat size 070 inch diameter Relief passage (vent) to fuel chamber No 42 (0935 inch) drill

Choke Carter Climatic® Control set 2 points rich Butterfly type—offset choke valve primary side only Choke heat suction hole restriction in piston housing size No 43 (089 inch) drill

Vacuum Spark Port 051 053 inch diameter Top of port 025 to 035 inch above valve with valve tightly closed Upper spark restriction (in body) size No 58 (042 inch) drill Lower spark restriction (in flange) size No 68 (031 inch) drill

Motor Tune-Up—Be Accurate!

CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3648

FLOAT LEVEL: Primary 1/8" (Gauge T109-232); secondary 3/16" (Gauge T109-222) between top of float and machined surface of casting. To adjust: bend float arms.

FLOAT DROP: Primary 5/8", secondary 11/16". To adjust: bend stop tabs on float bracket.

PUMP: Flat on pump arm should parallel straight edge on dust cover boss. To adjust: bend connector rod.

METERING ROD: Metering rod should bottom with throttle valves seated.

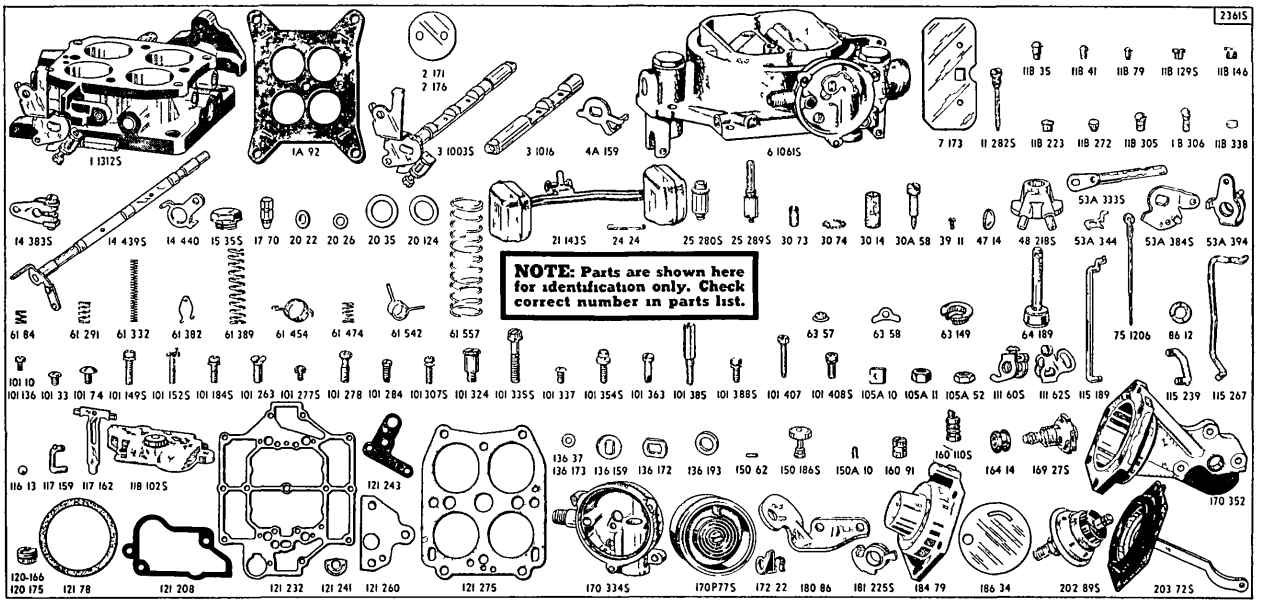
BOWL VAPOR VENT: 1/16" (Gauge T109-197) between bowl vapor vent valve and dust cover. To adjust: bend vapor vent arm.

FAST IDLE CAM CLEARANCE: With choke valve closed lip of fast idle cam should lightly contact boss on flange casting. To adjust: set choke shaft lever.

FAST IDLE THROTTLE VALVE CLEARANCE: .023" (Gauge T109-189) between lower edge of valve and bore with adjusting screw on high step of cam.

FAST IDLE ON CAR: 650 R.P.M. with speed screw on lowest (last) step of cam.

UNLOADER: 1/8" (Gauge T109-36) between upper edge of choke valve and inner wall of air horn. To adjust: bend unloader arm on throttle lever.



PRIMARY THROTTLE SHAFT DOG: 1. Place a .076" (Gauge T109-215) between wide open stop tang on primary throttle lever and stop on flange. 2. Adjust upper lug of throttle shaft dog so that upper arm of spring lightly contacts tang of throttle operating lever. 3. Hold both primary and secondary throttles in wide open position. 4. Adjust lower lug of throttle shaft dog so that lower arm of spring lightly contacts center web of throttle operating lever. NOTE: Use bending tool T109-214 to adjust lugs on throttle shaft dog.

SECONDARY THROTTLE LEVER: 1. Block choke valve wide open. 2. Back out throttle lever stop screw so that primary valves seat in carbureter bores. 3. While holding the secondary throttle open slightly, close the primary valves. The primary and secondary valves should become closed at the same time. Check to be sure that secondary throttle valves are tightly closed under tension of the primary throttle shaft flex spring by attempting to open the secondary throttle valves while holding the primary throttle valves closed.

NOTE: Secondary valves seat at top edge only.

4. To adjust, bend the throttle operating rod slightly.

DASH POT (SLOW CLOSING THROTTLE): Plunger shaft should bottom with 1/16" (Gauge T109-197) placed between shaft and operating lever with throttle valves seated.

Mercury—1956—Carbureters Nos. 2361S-2361SA

WHEN SERVICING, USE GASKET ASSORTMENT No. 270B; RE-CARBURETION KIT No. 1804N

101-407	Fast idle adjustment screw	
101-408S	Dash pot attaching screw and washer assembly	(2)
101-416	Coil housing attaching screw and spacer (2361SA)	(3)
103 14	Lead shot (late prod	(3)
105A-10	Choke lever clamp screw nut	
105A-11	Flange stud nut	(4)
105A-52	Dash pot lock nut	
111-60S	Metering rod arm and screw assembly	
111-62S	Pump arm and screw assembly	
115-189	Choke connector rod	
115-239	Throttle operating rod	

Part No.	PART NAME	
115 267	Throttle connector rod	
116-13	Pump intake check ball	
117-159	Pump arm link	
117-162	Vacumeter piston link	
118-102S	Dust cover assembly	
120-166	PRIMARY METERING ROD JET	(2)
120-176	Secondary metering jet (2361S) (Sup by 120 193)	(2)
120-193	Secondary metering jet	
121-78	COIL HOUSING GASKET	
121 208	DUST COVER GASKET	
121-232	AIR HORN GASKET	
121-241	PUMP JET HOUSING GASKET	
121-243	Piston housing gasket (Use with 6 1061S)	
121-260	Diaphragm housing to flange gasket (Sup by 121 297)	
121-275	BODY FLANGE GASKET	
121-282	Gasket (diaphragm to lower housing)	
121-283	Piston housing gasket (Use with 6 1170S)	
121 297	—Diaphragm housing gasket	
136-37	Throttle operating rod washer	(4)
136 159	Primary throttle shaft washer	
136-172	Secondary throttle shaft washer	
136-173	Pump connector link washer	(2)
136-193	Fast idle cam washer	
150-62	Choke piston pin	
150-186S	Pin and valve cap assembly	
150A-10	Pin spring	(6)
160-91	Choke piston	
160-110S	Vacuum piston and pin assembly	
164-14	Choke tube grommet	
169-27S	Spark control valve assembly (snivey)	
170-352	Diaphragm housing	
170-334S	Piston housing and plug assembly (Use with 6 1061S)	
170-442S	—Piston housing and plug assembly (Use with 6 1170S)	
170AB238S	Thermostatic coil and housing assembly	
172-22	Throttle connector rod retainer	
180-86	Dash pot bracket	
181-225S	Fast idle cam and spring assembly	
184-79	Diaphragm housing cap (Sup by 184 83S)	
184-83S	Diaphragm housing cap assembly	
186-34	Choke baffle plate	
186-57	Exterior choke baffle (2361SA)	
202-89S	Dash pot assembly	
203-72S	Secondary throttle shaft diaphragm assembly	

—Parts so marked are new and listed for the first time

NOTE Figures in parentheses indicate number of pieces used in one carbureter Where no figure is shown only one is used

CARTER MODEL WCFB CARBURETER FOR MERCURY (SERVICE ADJUSTMENT PROCEDURE)

NOTE: The parts and specification pages referred to are catalog pages. These pages can be obtained from Carter Carburetor, Catalog Department, St. Louis (7), Missouri. Specify the carbureter number found on the brass identification tag, when requesting specification pages.

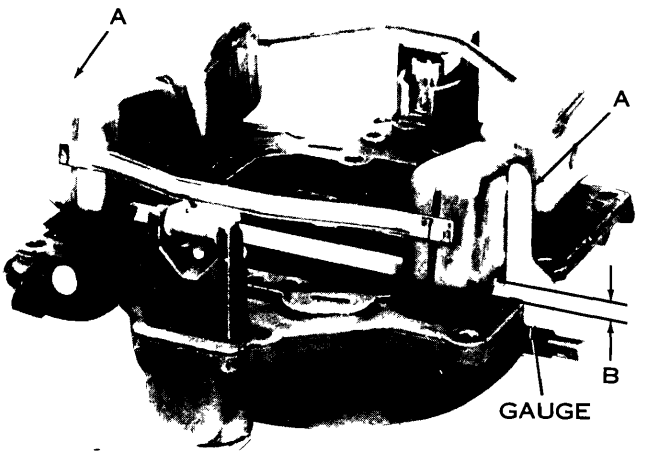

Figure 1
Float Adjustment

FLOAT ADJUSTMENT (Fig. 1):

1. Lateral - Place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting. Side of floats should just clear the vertical uprights (A) of float gauge. To adjust, bend arms of floats.
2. Vertical - With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance (B) between top of float and machined surface of casting must be as listed on carbureter specification page. To adjust, bend center portion of float arms.

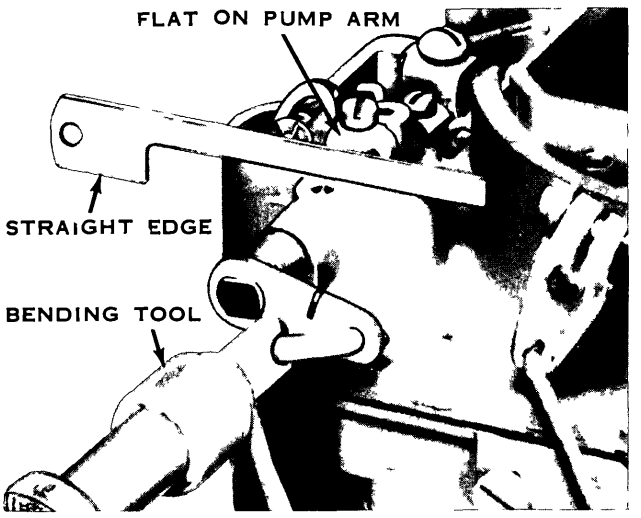

Figure 3
Pump Adjustment

PUMP ADJUSTMENT (Fig. 3):

1. Install pump conn ctor link in top h le (sh rt strok) f pump plung r with ends xt nding outward t ward c unter-sh aft arm.
2. Bcck ut thr ttl lev r set scr w until thr ttle valv s s at in bor s of carbur t r.
3. Hold straight dg across top of dust c ver boss at pump arm. The flat n top f pump arm should be parallel t straight edge. To adjust. bend thr ttl c nnect r r d at l w r angle. (Us t l T109-213.)

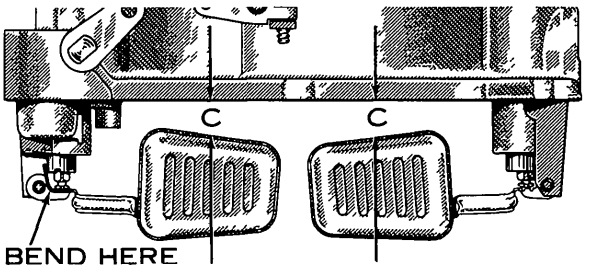

Figure 2
Float Drop Adjustment

FLOAT DROP ADJUSTMENT (Fig. 2):

With bowl cover held in upright position and m asuring from center of floats, the distance (C) between top of fl ats and bowl cover should be as listed on carburet r sp cification page. To adjust, bend stop tabs on float brac ket.

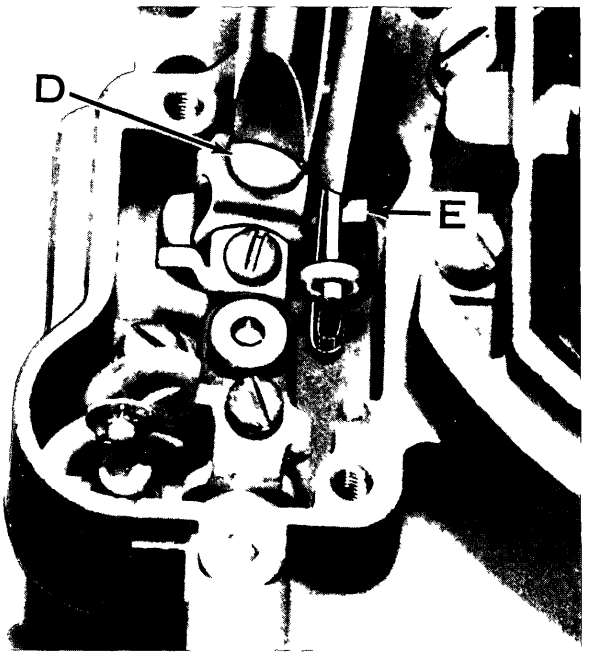

Figure 4
Metering Rod Adjustment

METERING ROD ADJUSTMENT (Fig. 4):

1. Back out throttle lever set screw to allow thr ttl valves to seat in bores of carbureter and lo sen met ring r d arm clamp screw (D).
2. Press down on vacumeter link until metering rods bott m in carbureter body casting.
3. Holding r ds in d wnward p siti n and throttl valv s s ated, rev lv met ring rod arm until finger n arm c ntacts lip (E) f vacum ter link. Hold in place and car - fully tight n clamp screw (D).

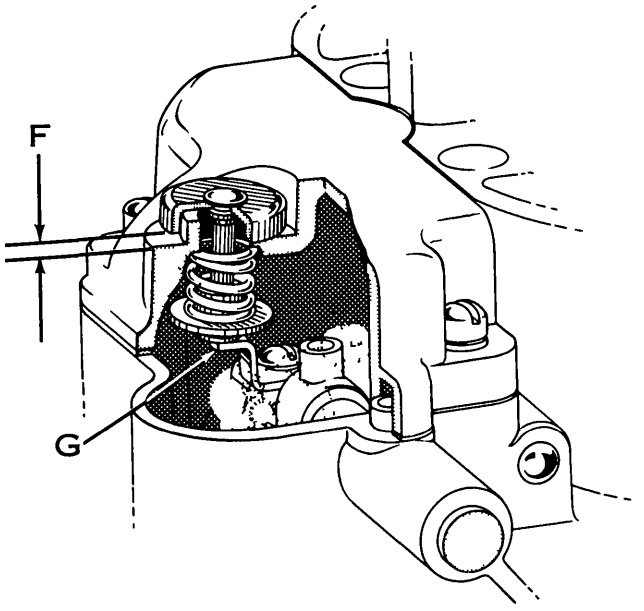

Figure 5
B wl Vapor Vent Adjustment

BOWL VAPOR VENT ADJUSTMENT (Fig. 5):

1. Install dust cover and dust cover gasket.
2. With thr ttl valves seated, there should be the clearanc (F) as listed on carbureter specification page betwe n l wer edge of bowl vapor vent valve and dust cov r. To adjust, remove dust cover and bend vapor vent arm (G).

Figur 6A
Fast Idl Adjustment

Figure 6B
Fast Idle Adjustment

FAST IDLE CAM CLEARANCE ADJUSTMENT (Fig. 6A):

1. Loosen choke lever clamp screw (H) on choke shaft.
2. Hold choke valve tightly closed. Take slack out of linkage by pressing choke lever towards closed position, s that lip of fast idle cam lightly contacts boss on flang casting (J) - hold in place. Tighten clamp screw (H).

FAST IDLE THROTTLE VALVE CLEARANCE ADJUSTMENT (Fig. 6B):

With choke valve tightly closed, tighten fast idle adjusting screw (K) (on high step of cam) until there is the clearance as listed on carbureter specification page between thr ttl valve and bore of carbureter, side opposite idle port.

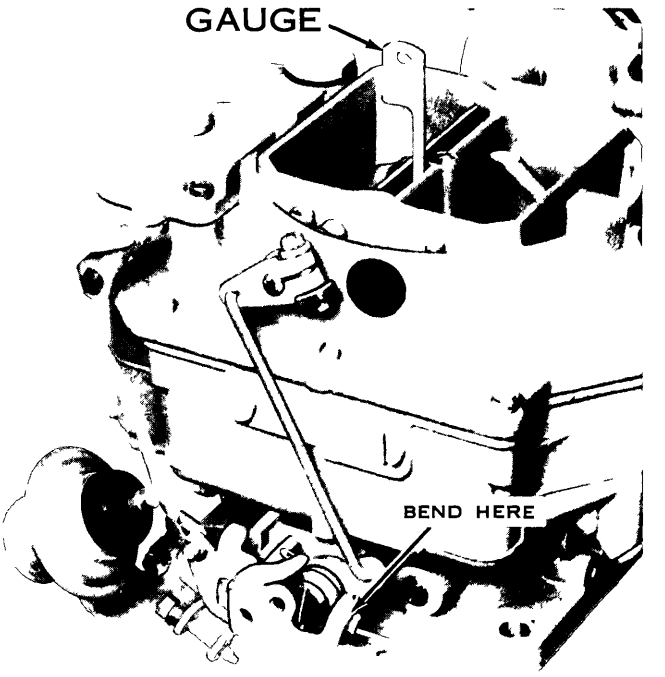

Figure 7
Unl ader Adjustment

UNLOADER ADJUSTMENT (Fig. 7):

With throttle wid op n th r should b the clearance as list d n carbur ter sp cificati n pag betw n upp r dge of chok valv and inn r wall of air horn. To adjust, b nd unload r lip on throttl shaft l ver. (Use tool T109-41.)

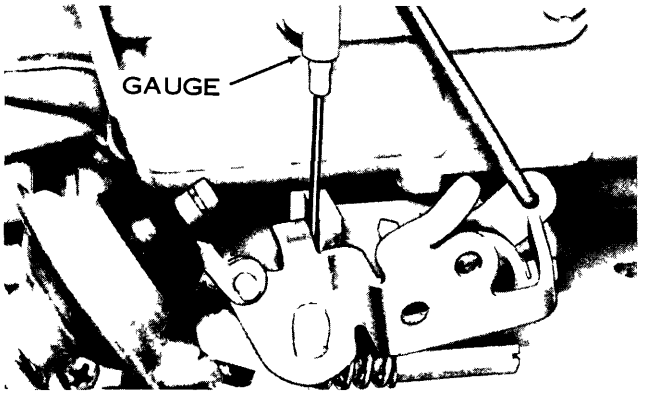

Figure 8

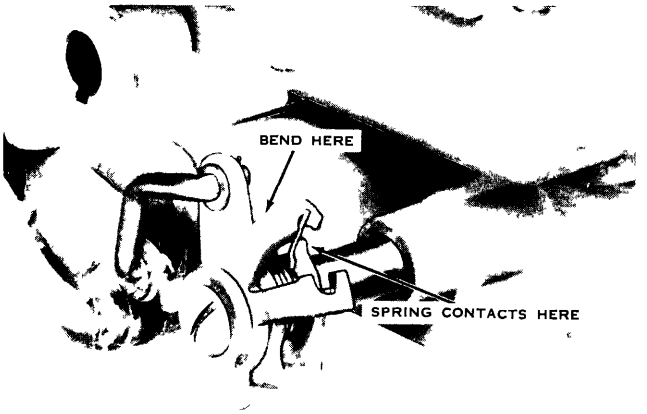

Figure 9

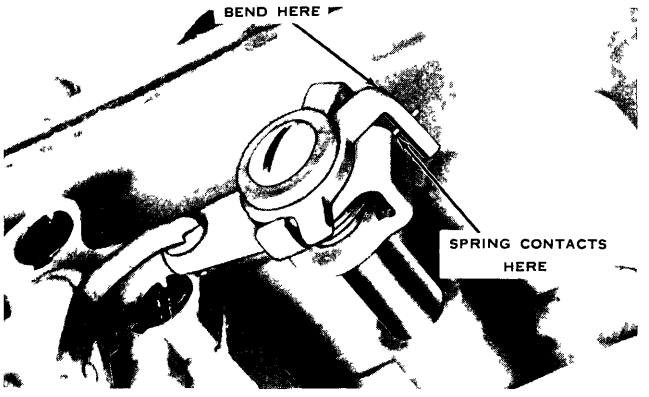

Figure 10

PRIMARY THROTTLE SHAFT DOG ADJUSTMENT (Figs. 8, 9, & 10):

1. Place gauge as listed on carbureter specification page between wide open stop tang on primary throttle lever and stop on flange.
2. Adjust upper lug of throttle shaft dog so that upper arm of spring lightly contacts tang of throttle operating lever.
3. Hold both primary and secondary throttles in wide open position.
4. Adjust lower lug of throttle shaft dog so that lower arm of spring lightly contacts center web of throttle operating lever. NOTE: Use bending tool T109-214 to adjust lugs on throttle shaft dog.

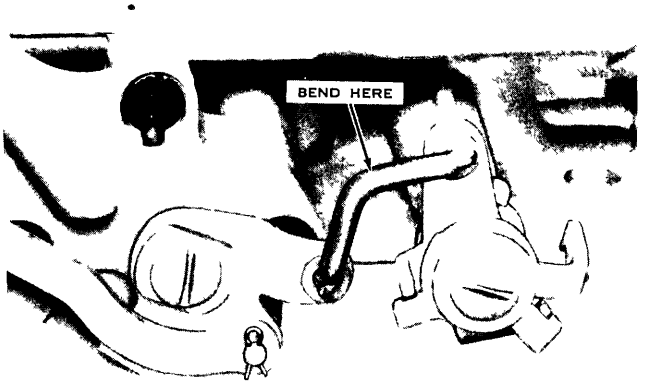

Figure 11
Secondary Throttle Lever Adjustment

SECONDARY THROTTLE LEVER ADJUSTMENT (Fig. 11):

1. Block choke valve wide open.
2. Back out throttle lever stop screw so that primary valves seat in carbureter bores.
3. While holding the secondary throttle open slightly, close the primary valves. The primary and secondary valves should become tightly closed at the same time. Check to be sure that secondary throttle valves are tightly closed under tension of primary throttle shaft flex spring by attempting to open the secondary throttle valves while holding the primary throttle valves closed. NOTE: Secondary valves seat at top edge only. To adjust, bend the throttle operating rod slightly. (Use tool T109-213.)

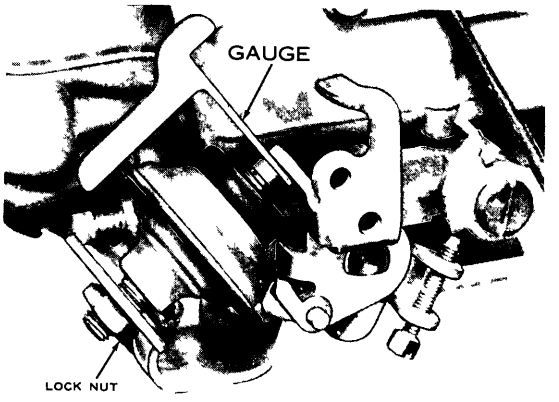

Figure 12
Dashpot Adjustment

DASH POT (SLOW CLOSING THROTTLE) ADJUSTMENT (Fig. 12):

Plunger shaft should bottom with the gauge listed on carbureter specification page placed between shaft and operating lever with throttle valves tightly closed. To adjust, loosen lock nut and adjust dash pot unit.

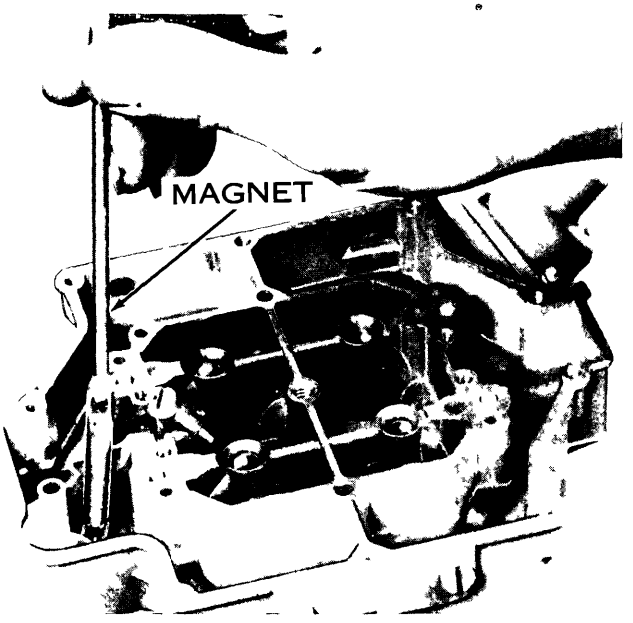

Figure 13

(Fig. 14):

Inspect gasketed surfaces between body and air horn, and between body and flange. Small nicks or burrs should be smoothed down to eliminate air or fuel leakage. Be especially particular when inspecting the top surface of the inner wall of the bowl around the choke suction passage. (See Fig. 14.) A poor seal at this location may contribute to a "cutting-out" on turns complaint.

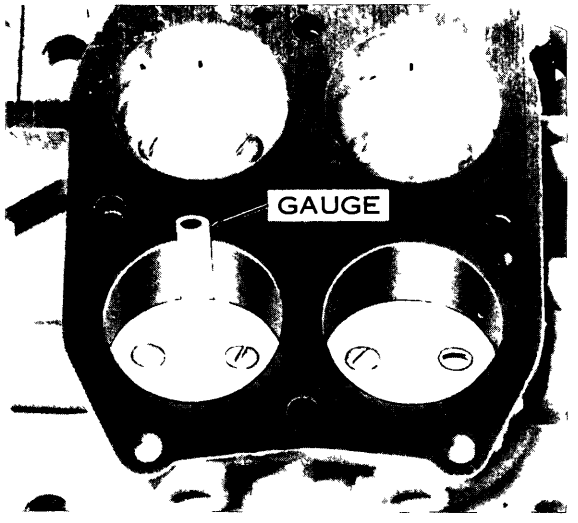

Figure 15

(Fig. 13):

Flooding, stumble on acceleration and other performance complaints are, in many instances, caused by the presence of dirt, water or other foreign matter in the carburetor. To aid in diagnosing the cause of the complaint, the carburetor should be carefully removed from the engine without draining the fuel from the bowl. The contents of the fuel bowl may then be examined for contamination as the carburetor is disassembled.

Check the fuel in the bowl for contamination by dirt, water, gum or other foreign matter. A magnet moved through the fuel in the bowl will pick up and identify any iron oxide dust that may have caused intake needle and seat leakage. (See Fig. 13.)

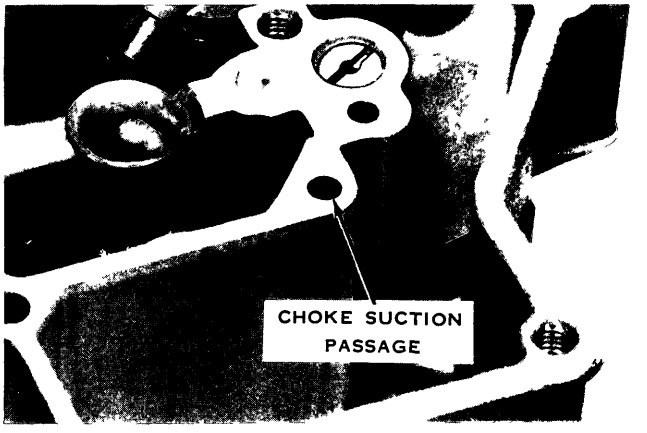

Figure 14

(Fig. 15):

Secondary throttle valves are seated using a .002" gauge, 1/4" wide (gauge T109-281) between the center of lower edge of throttle valves and bore of carburetor. (See Fig. 15.) With the gauge in position and valve attaching screws loose, tap valve lightly so it will align itself in the bore, hold in position and tighten screws. CAUTION: Turn screws only as much as needed to loosen valve as they are burred over and may break off if forced. If screws are to be removed, file off staked ends before loosening, then use new screws when reassembling.

NOTE: Primary valves are seated tightly in bore in usual manner. No gauge is used.

Fill the carburetor bowl with clean fuel before installing on the manifold. This will help prevent dirt trapped in the fuel system from being dislodged by the free flow of fuel as the carburetor is primed. The operation of the floats and intake needle and seats may be checked under pressure if a fuel pump is used at the bench to fill the carburetor bowl. Operate the throttle several times and visually check the discharge from the pump jets.

Before installing the carburetor, hold choke valve open and turn the idle speed screw until it just contacts the throttle lever, then 1/2 of a turn more to open the throttle valves enough to keep the engine running until the idle mixture and final RPM adjustment can be made.

SERVICE PROCEDURE

CAUTION REMOVE HIGH SPEED NEEDLE BEFORE REMOVING BOWL

To Disassemble

1 Remove carbureter from engine

2 Remove high speed adjusting needle packing nut and packing (SCRIBE MARK ON BODY AND BOWL)

3 Remove bowl nut gasket and bowl

4 Remove float pin float spring needle and needle seat Check float for dents leaks and wear on float lip or in float pin holes

5 Remove bowl ring gasket

6 Remove idle adjustment screw and spring

7 Remove nozzle
DO NOT REMOVE LOW SPEED JET TUBE

8 Remove throttle valve screws valve and shaft and lever assembly

9 Clean all parts with solvent making sure all carbon accumulation is removed from bore especially where throttle valve seats in casting Blow out all passages with compressed air Replace all worn and damaged parts Always use new gaskets

To Assemble

10 Install throttle shaft and valve Valve must be installed with trademark C on side toward idle port when viewing from flange side Always use new screws With valve screws loose and throttle lever set screw backed out seat valve by tapping lightly with a small screwdriver Hold in place while tightening screws

11 Install nozzle making sure it seats in casting

12 Install needle seat spring needle float and float pin

13 Set float level with carbureter casting inverted float resting lightly against needle in its seat There should be (N 2150S) 3/32 inch (N 2537S) 11/64 inch clearance between outer surface of casting and free end of float (side opposite needle seat) Adjust by bending lip of float

14 Install bowl ring gasket bowl (line up scribe marks) bowl nut gasket and bowl nut Tighten securely

15 Install high speed adjusting needle packing nut and new packing Turn needle in until it just seats in body then back out 1¼ turns

16 Install idle adjusting screw finger tight Back out approximately 1¼ turns Do not use pliers or screwdriver as it may damage idle screw

17 Install carbureter on engine and make idle and high speed adjustment as necessary

HIGH SPEED AND IDLE SCREW ADJUSTMENT

After rebuilding and installation on engine is complete the final high speed and idle screw adjustments must be made Turning the adjustable main metering screw clockwise produces a leaner high speed mixture and turning the idle screw clock wise produces a richer idle mixture

When adjusting the idle needle turn approximately 1/8 turn at a time then wait sufficient time for engine to respond to this adjustment

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: With gasket removed, bowl cover assembly inverted and float resting on seated needle the distance from the bowl cover to the top of float at free end should be ½ inch (gauge T109-83) Adjust by bending lip of float not float arm

METERING ROD ADJUSTMENT. This adjustment is important and should be checked each time the carbureter is reassembled or lean rods are installed With throttle valve seated in bore of carbureter press down on upper end of diaphragm shaft until diaphragm bottoms in vacuum chamber Tool T109-212 may be used to hold diaphragm shaft down while adjusting metering rod Metering rod should contact bottom of metering rod well and metering rod arm should contact lifter link at the outer end nearest the springs and at supporting lug Adjust by bending lip of metering rod arm to which metering rod is attached up or down

ACCELERATING PUMP. If acceleration is not satisfactory remove pump housing intake check assembly and discharge check ball and spring Examine diaphragm for wear or damage Be sure intake screen intake check and discharge check are not clogged with lint or foreign matter Discharge check ball must

ST. LOUIS 7, MO., U.S.A.

GENERAL BULLETIN

CARBURETER CONTRACT ACCOUNTS
FACTORY, P.I. AND P.C.T. GRADUATES

BULLETIN NO. 14 American Motors
(File Under Nash)

DATE May 12, 1958

SUBJECT: 1958 Rambler "6" Carter WCD-2350S and 2586S (Dual) Carbureters Stumble on Acceleration Complaints

A new metering rod part 75-1431 has been released to correct a stumble on light part throttle acceleration at car speeds under 25 M.P.H.

The new rod has the lower end of its idle stabilizing flat located .050" closer to the bottom of the rod. This change speeds up the flow of fuel upon light acceleration.

The metering rods may be installed without removing the carbureter from the engine. The metering rod adjustment should be checked when the new rods are installed.

Two metering rods are required. American Motors has assigned part number 3201205 to a package consisting of (2) 75-1431 metering rods. An initial shipment of a limited quantity of part 75-1431 will be made to Carter Central Distributors.

Carter warranty is not involved

GENERAL BULLETIN

CARBURETER CONTRACT ACCOUNTS
FACTORY, P.I. AND P.C.T. GRADUATES

BULLETIN NO. 13 American Motors
(File Under Nash)
DATE May 12, 1958

SUBJECT: 1958 Rambler "6" Carter Model AS (Single Bore) Carbureter-Percolation Complaints

A portion of a bulletin sent by American Motors to their Zones and Dealers on this subject is quoted below:

"This condition usually occurring after a 10 to 30 minute engine shut down may be attributed to a number of factors.

"During cold weather operation, light volatile fuels are generally used. These highly volatile fuels with their low boiling point characteristics vaporize readily and form small bubbles in the passages of the carburetor. During engine operation, gasoline flows constantly and is replenished with relatively cool fuel. However, after engine shut down, the static fuel confined in the carburetor passages is heated by heat transmitted from the engine block until the fuel boils and is forced out the nozzle into the intake manifold.

"A similar condition occurs during warm weather operation with less volatile fuels. The higher ambient temperatures create higher operating temperatures which in turn also cause the fuel to boil.

"These carburetors are equipped with anti-percolator devices which will take care of normal fuel expansion. However, it is impossible to control the type of gasoline the owner is to use and its characteristics.

"This hard hot start can become an aggravated owner complaint if the owner is not aware of the carburetor unloader feature. It is important when attempting to start the engine after a short period shut down to open the throttle and allow sufficient fresh air to enter the manifold for a more combustible mixture.

"In extreme cases where the car is constantly operated under this short period shut down condition, a 3/16" thick gasket, AMC part #3147641, may be installed between the carburetor gasket and the manifold cover. The standard corebestos gasket must be used at the carburetor flange side on automatic transmission equipped cars with vacuum control ports in base of the carburetor. Part 3147641 will serve as an insulator against heat normally transmitted to the carburetor under these conditions."

(over)

IMPORTANT: THIS BULLETIN CONTAINS INFORMATI N OF VALUE TO YOU AND WAS PREPARED AT CONSIDERABLE EXPENSE TO BE OF SERVICE TO YOU. FAILURE TO USE THIS INFORMATION MAY COST YOU M NEY. WE SUGGEST THAT YOU ISSUE COPIES OF IT TO THOSE OF YOUR STAFF INTERESTED, SO THAT THEY CAN BE FILED IN REGULAR CARTER SALES AND SERVICE MANUAL.

©

Part 3147641 corresponds to Carter 1A-112. The standard hard steel reinforced gasket is Carter part 1A-131 which will be available shortly. As noted above, the 1A-131 gasket should be used between the 1A-112 and the carbureter on automatic transmission cars to avoid blocking the transmission vacuum passage in the carbureter flange surface. The 1A-112 is soft and may be compressed into this passage when the carbureter attaching nuts are tightened.

Carter warranty is not involved.

Lower Port (For Idle Adjustment Screw): Size No 52 (.0635 inch) drill Auxiliary idle feed, No 52 (.0635 inch) drill

Set Idle Adjustment Screw: ¼ to 1¼ turns open For richer mixture, turn screw out Do not idle engine below 475 R P M. (Automatic Trans—in neutral), 500 R P M (Standard and Overdrive Trans) For cars with air conditioning set idle at 500 R P M with compressor in operation.

Main Nozzle: Nozzle is installed permanently DO NOT REMOVE Anti-percolator bleed tube, off center in plug DO NOT REMOVE Plug has milled flat on one side

Accelerating Pump: Pressure type, mechanically operated Pump jet size No 70 (.028 inch) drill Intake disk check seat (in plunger assembly) size No 40 (.098 inch) drill Discharge ball check seat (in body) size No 42 (.0935 inch) drill

Choke. Carter Climatic® Control, set two points rich Offset butterfly type Choke heat suction hole in air horn size No 36 (.1065 inch) drill

Vacuum Spark Port: Round type, 052 inch diameter Top of port to be 040 to 050 inch above top edge of valve with valve tightly closed

Transmission Vacuum Control Hole: (2664S 2748S only) Flush with throttle valve (manifold side) size No 56 (.046 inch) drill Bleed to flange cavity size No 56 (.0465 inch) drill

Motor Tune-Up—Be Accurate!

CAUTION Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter

Spark Plug Gap .035"	Breaker Point Setting .016"	Ignition Timing Breaker Points to Open: T. D. C. At Vibration Damper	Valve Setting (Hot) Intake .012" Exhaust .015"	Float Setting ¼ Inch (Use Gauge T109-282)	Idle Adjustment Screw Setting ¼ to 1¼ Auto. Trans. 475 R.P.M. Std. & O'Drive 500 R.P.M.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3662

Float: ¼" (Gauge T109 282) from top of each float (at free end) to top of casting To adjust, bend float lip. After float adjustment has been made there should be .010" to .015" clearance between overlapping tangs on float levers To adjust bend long tang on left hand float

Pump: Pump arm on lifter link should parallel top of casting To adjust Bend pump arm

Metering Rod Rod should just bottom at wide open throttle To adjust Bend metering rod arm

Fast Idle: .030" (Gauge T109-29 may be used) between lower edge of valve and bore with fast idle link on high step of cam To adjust Bend choke connector rod.

Fast Idle on Car: 1800 R P M (Hot)

Unloader: 3/16" (Gauge T109-28) between top edge of valve and inner wall of air horn To adjust Bend arm on choke trip lever

WCD DUAL DOWN-DRAFT CLIMATIC® CONTROL **CARBURETER No. 2586S**

CARBURETER SPECIFICATIONS

For Rambler 6 Cylinder 195 Cu. In. Engine: Vacuum at Idle 19 Inches

Dimensions: Flange size 1 1/8 inch dual, 4 bolt type
Primary venturi, 11/32 inch I D
Secondary venturi, 21/32 inch I D
Main venturi, 1-1/16 inch I D

Vents: Inside, (in air horn) (1).
Outside, (in dust cover) (1)

Gasoline Intake: Square vertical needle Size No 38 (1015 inch) drill in needle seat

Low Speed Jet Tube: Jet size No 71 (026 inch) drill
By-pass, size 051 inch diameter
Economizer, size No 56 (0465 inch) drill
Idle bleed, size 051 inch diameter

Idle Ports: Upper port, length, 105 inch Width, 030 inch

Idle Port Opening: 074 to 080 inch above upper edge of valve with valve closed tight

Lower Port (For Idle Adjustment Screw): Size 0615 to 0655 inch diameter

Set Idle Adjustment Screw: 1/2 to 1 1/2 turns open For richer mixture turn screw out Do not idle engine below 450 r p m (Hydra Trans) in neutral, 500 r p m (Std and Overdrive Trans)

Main Nozzle: In primary venturi, closed tip Nozzle is installed permanently Do not remove

Metering Rod. Economy step 0725 inch diameter, middle step tapers to 064 inch diameter Power step 0618 inch diameter These rods are designed with idle stabilizing flat on economy step

Metering Rod Jet· 089 inch diameter

Accelerating Pump: Discharge jet (twin) size, No 67 (032 inch) drill
Intake ball check seat size 115 to 120 inch diameter
Discharge (needle seat) size No 50 (070 inch) drill

Choke Carter Climatic® Control, set on index Offset butterfly type Choke heat suction hole in bowl cover Size No 36 (1065 inch) drill

Vacuum Spark Port Round type 040 inch diameter Top of port 033 to 043 inch above valve with valve tightly closed

Transmission Vacuum Control Hole Flush with throttle valve (manifold side) size 0492 inch diameter Bleed to flange cavity (early prod) No 56 (0465 inch) drill, (late prod) 0472 inch diameter

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .016"	Ignition Timing Breaker Points to Open: T. D. C. At Vibration Damper	Valve Setting (Hot) Intake .012" Exhaust .015"	Float Setting 5/32 Inch (Use Gauge T109-196)	Idle Adjustment Screw Setting 1/2 to 1 1/2 Hydramatic Trans. (In Neutral) 450 R.P.M. Std. & O'Drive 500 R.P.M.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical.

LATERAL ADJUSTMENT. With bowl cover assembly inverted, bowl cover gasket removed, place float gauge directly under floats with notched portions of gauge fitted over edges of casting. Sides of floats should barely touch the vertical uprights of float gauge. Adjustment should be made by bending arms of floats

VERTICAL ADJUSTMENT· With float gauge in same position, floats should just clear the horizontal portion of gauge. (Vertical distance between top of float and machined surface of casting must be 5/32 inch.) (Gauge T109-196) Adjust by bending float arms Remove floats, install bowl cover gasket and then reinstall floats.

PUMP ADJUSTMENT: Install pump connector link in outer hole (long stroke) of pump arm, with ends extending away from countershaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter Be sure fast idle adjusting screw does not hold throttle open Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at upper angle Use tool T109-213

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment No metering rod gauges are necessary Procedure is as follows 1 Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. 2 With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting 3 Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link Hold in place and carefully tighten clamp screw

FAST IDLE ADJUSTMENT: Loosen choke lever clamp screw on choke shaft Insert 010 inch feeler gauge T109-200 between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw

With choke valve tightly closed, tighten fast idle adjusting screw until there is 020 inch (gauge T109-29) opening between throttle valve and bore of carbureter (side opposite idle port) Be sure fast idle adjusting screw is on high step of cam while making this adjustment

UNLOADER ADJUSTMENT: With throttle wide open there should be 3/16 inch (gauge T109-28) clearance between upper edge of choke valve and inner wall of air horn Adjust by bending unloader lip on throttle shaft lever (Use bending tool T109-41)

CARTER MODEL AS CARBURETER FOR HUDSON–NASH SERVICE ADJUSTMENT PROCEDURE

NOTE: The parts and specification pages referred to are catalog pages. These pages can be obtained from Carter Carburetor, Catalog Department, St. Louis (7), Missouri. Specify the carbureter number found on the brass identification tag, when requesting specification pages.

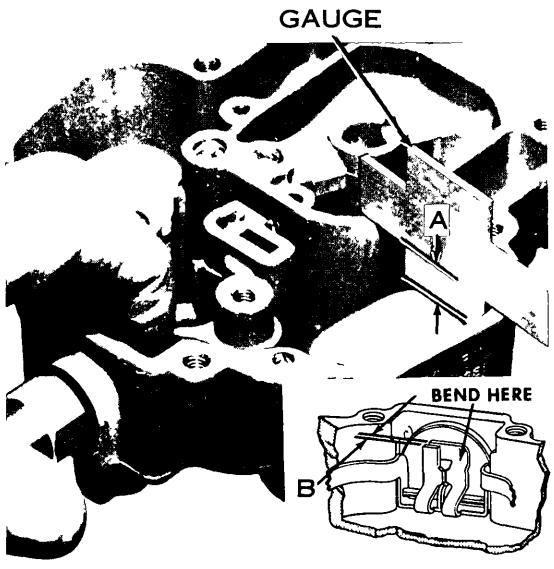

Figure 1

FLOAT ADJUSTMENT (Fig. 1)

The bowl cover gasket and float pin retainer must be removed. Gauge and adjust each float separately.

1. Hold the lip on float arm against the seated needle making sure the float pin is at the bottom of its guide slots.
2. The distance from the top surface of the body casting to the top of the float (A) should be as listed on carbureter specification page under float adjustment.
3. Adjust by bending lip on float arm. If necessary, bend float arms slightly to provide clearance on all sides of floats.
4. After float adjustment has been made and with both float lips resting against seated needle, there should be the clearance (B) listed on carbureter specification page between overlapping tangs on float levers. This can be checked by installing float pin retainer and turning carbureter upside down allowing floats to drop and make contact against seated needle. Adjust by bending long tang on left hand float.
5. Recheck float level adjustment.

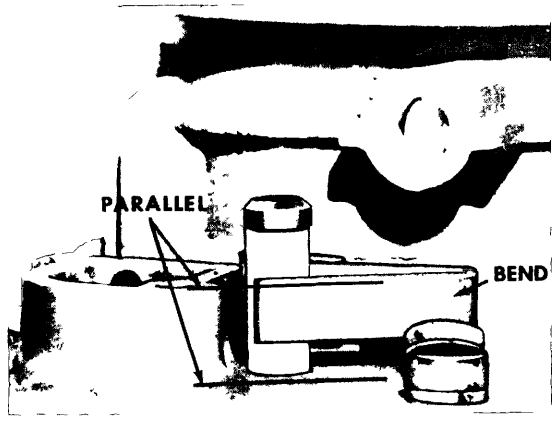

Figure 2

PUMP ADJUSTMENT (Fig. 2)

1. Open throttle valv to wide open position. Top of pump arm on lifter link should be parallel to top surface of bowl cover.
2. To adjust, bend pump arm.

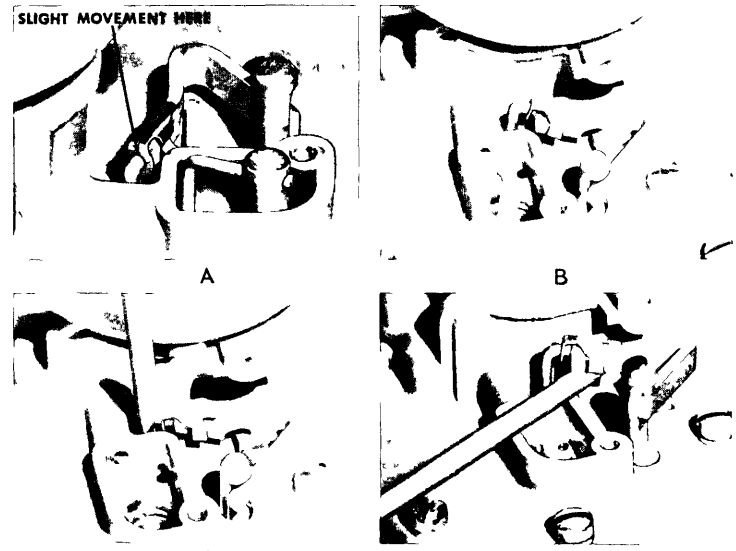

Figure 3

METERING ROD ADJUSTMENT (Fig. 3)

With throttle valve wide open the metering rod should just bottom in carbureter casting.

1. If the rod is properly adjusted, some movement can b noted around rod in the eye of metering rod retainer clip when the throttle is moved slightly from wide open position (Fig. 3A).
2. If the rod is too low it will tend to push the metering rod retainer clip up (Fig. 3B).
3. If the rod is too high it will be possible to push the rod down (Fig. 3C).
4. To adjust bend metering rod arm (Fig. 3D).

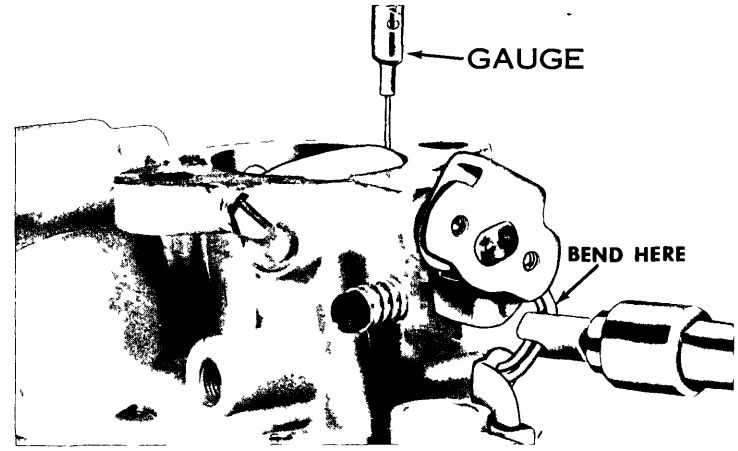

Figure 4

FAST IDLE ADJUSTMENT (Fig. 4)

1. Remove thermostatic coil housing assembly, gasket and baffle plate.
2. With throttle adjustment screw backed out, crack throttle valve and hold choke valve in fully closed position. Then close throttle. This will allow fast idle cam to revolve to fast idle position.
3. There should now be the clearance listed on carbureter specification page b tw en throttl valv and bore of carbureter (Sid opposit idl port).
4. Adjust by bending choke connector rod. (use tool T109-213).

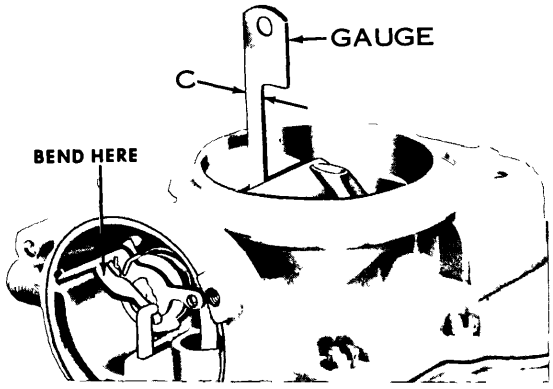

Figure 5

SERVICE INFORMATION

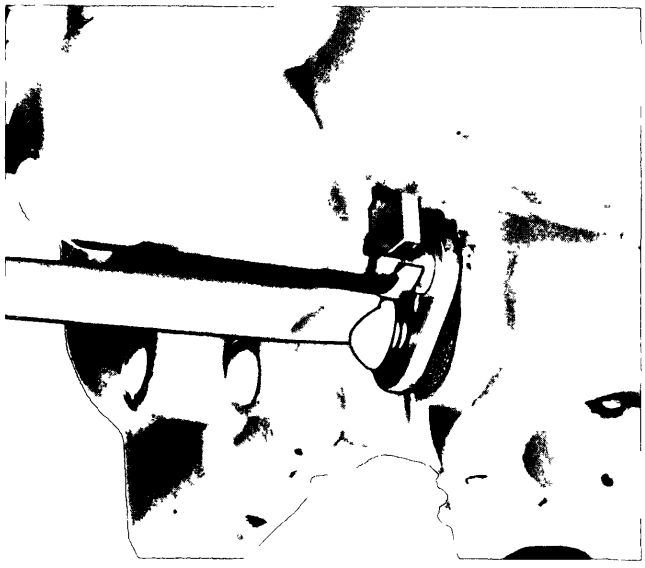

Figure 1

1. Throttle shaft arm must be removed before carbureter can be disassembled. (Fig. 1).

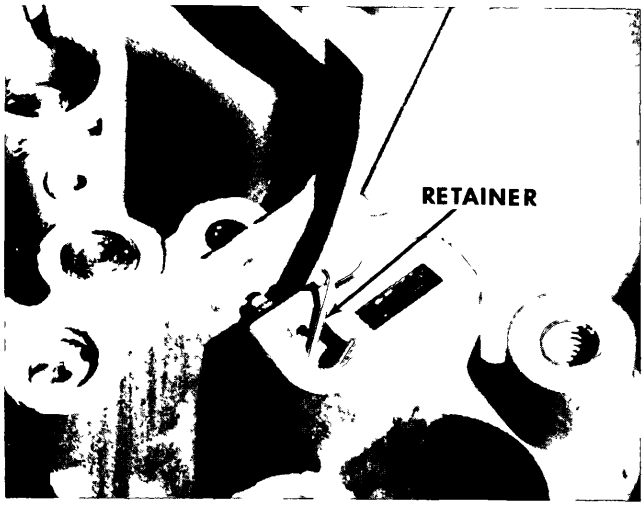

Figure 2

2. Accel rating pump discharge ch ck ball retainer is removed, using tool T109-56 (Fig. 2). (Intake ch ck is in pump plunger and not removable.)

UNLOADER ADJUSTMENT (Fig. 5)

1. Hold throttle valve wide open and close choke valve as far as possible without forcing.
2. There should now be the clearance (C) listed on carbureter specifiifation page between upper edg of choke valve and inner wall of air horn.
3. Adjust by bending arm on choke piston lever. (Use bending tool T109-214.)

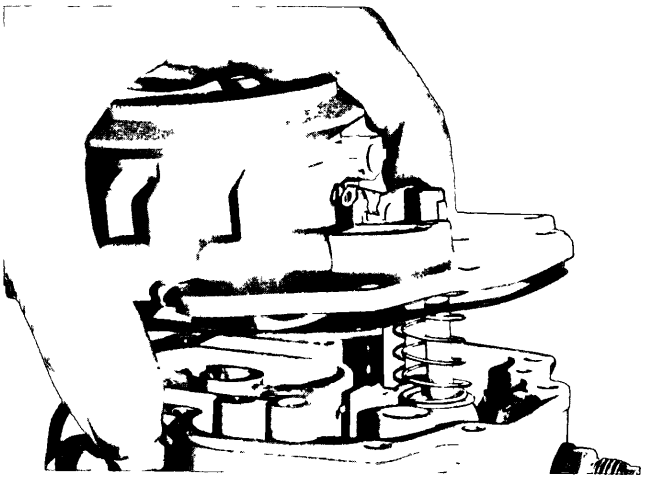

Figure 3

ASSEMBLING AIR HORN TO BODY (Fig. 3)

1. Place body gasket on air horn.
2. Install metering rod retainer on pump lifter link. (Do not install metering rod at this time.) Insert pump lifter link through opertaing slot in air horn.
3. Place pump spring over pump plunger and install plung r in air horn.
4. Install fast idle link in choke piston housing.
5. Holding plunger, lifter link and gasket in position, lower bowl cover onto carbureter body (Fig.3).

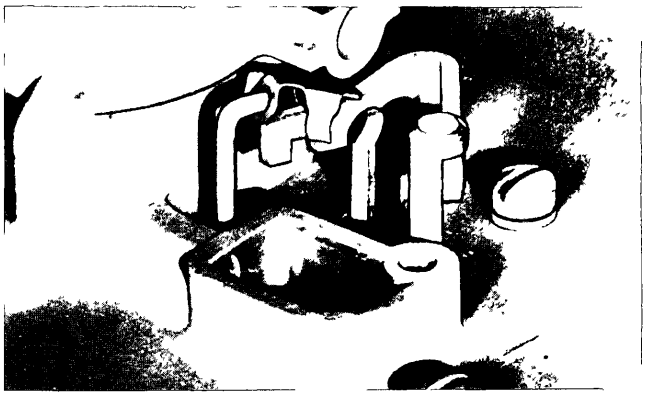

Figure 4

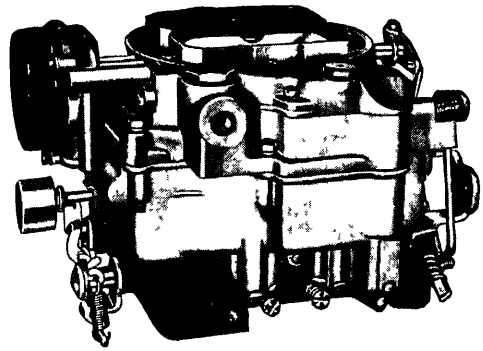
INSTALLATION OF METERING ROD (Fig. 4)

1. Place metering rod retainer in position shown in Fig. 4.
2. Lower rod into place until the end of rod enters hole in retainer.
3. Push metering rod and retainer down to operating position. Push retainer toward rod until ears on retainer fit into slot in pump arm on lifter link.



Fill carbur t r bowl with clean fu l b for installing on manifold. Operation of the float and intak ne dle and s at may be checked under pressure if the fuel pump is used at the bench to fill the carbur ter bowl. Operate the throttle several times and visually check the discharge from th pump jet.

WCFB Four-Bore Down-Draft Climatic® Control **Carbureters Nos. 2593S-2593SA**

CARBURETER SPECIFICATIONS

For Nash-Hudson 8 Cylinder Engine: 4 Inch Bore, 3¼ Inch Stroke

Dimensions: Flange Four Bore—4 bolt type.
Throttle bore 1-7/16 inch.
Primary venturi size, 11/32 inch I. D.
Main venturi size, 1-3/16 inch I. D.

Vents: Outside, 4. Inside, 5.

Gasoline Intake: Size No. 42 (.0935 inch) drill hole in needle seat.

Low Speed Jet Tube: (Primary side only). Jet, size No. 68 (.031 inch) drill.
By-pass, in body, size No. 54 (.055 inch) drill.
Economizer, in low speed jet, size .049 inch diameter.
Idle bleed, in body, size .065 inch diameter.

Idle Port: (Upper) slot type. Primary, length .185 inch; width .030 inch. Secondary, none.

Idle Port Opening: Primary, .130 to .136 inch above top edge of valve with valve tightly closed. Secondary, none.

Lower Port: Primary (for idle adjustment screw), size No. 53 (.0595 inch) drill. Secondary, none.

Set Idle Adjustment Screw: ¼ to 1¼ turns open. For richer mixture turn screw out. Do not idle engine below 450 r.p.m. Automatic Trans.—in neutral; 500 r.p.m. for Standard and Overdrive Trans. For cars with air conditioning set idle at 500 r.p.m. with compressor in operation.

Main Nozzle: Installed permanently. **DO NOT REMOVE.** Anti-percolating jet, primary size No. 70 (.028 inch) drill. Secondary size No. 72 (.025 inch) drill.

Metering Rod: (Vacumeter Type) see parts list for size.

Metering Rod Jet: Primary size .098 inch; secondary size .0635 inch diameter.

Accelerating Pump: Discharge jet (Twin) primary side only, size No. 72 (.025 inch) drill. Intake ball check seat, size .115 to .120 inch diameter. Discharge needle seat, size No. 50 (.070 inch) drill.

Choke: Carter Climatic® Control, set on index. Butterfly type—offset choke valve, primary side only. Choke heat suction hole, restriction in piston housing, size No. 43 (.089 inch) drill.

Vacuum Spark Port: Horizontal, slot, round end type—.130 x .040 inch. Top of port to be .040 to .046 inch above top edge of valve with valve tightly closed.

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .016"	Ignition Timing Breaker Points to Open: 5° B. T. D. C. At Vibration Damper	Float Setting See Adjustments	Idle Adjustment Screw Setting ¼ to 1¼ Auto. Trans. 450 R.P.M. Std. & O'Drive 500 R.P.M.

NOTE: These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3689.

FLOAT LEVEL: Primary 1/8" (Gauge T109-232); secondary 3/16" (Gauge T109-222) between top of float and machined surface of casting. To adjust: bend float arms.

FLOAT DROP: Primary 5/8", secondary 11/16". To adjust: bend stop tabs on float bracket.

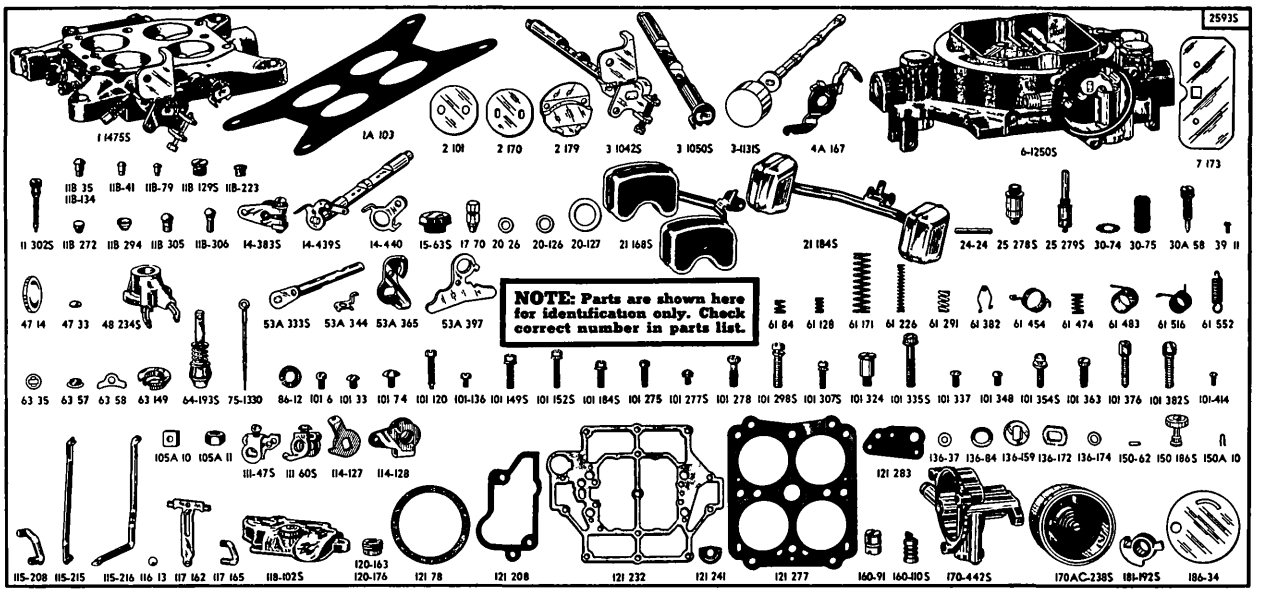
PUMP: Flat on pump arm should parallel straight edge on dust cover boss. To adjust: bend connector rod.

METERING ROD: Metering rod should bottom with throttle valves seated.

BOWL VAPOR VENT: 1/16" (Gauge T109-197) between bowl vapor vent valve and dust cover. To adjust: bend vapor vent arm.

FAST IDLE CAM CLEARANCE: .026" (Gauge T109-189) between lip of fast idle cam and boss on flange casting with choke valve closed. To adjust: set choke shaft lever.

FAST IDLE THROTTLE VALVE CLEARANCE: .023" (Gauge T109-189) between lower edge of valve and bore with adjusting screw on high step of cam.



FAST IDLE ON CAR: 1600 to 1800 R.P.M. hot engine with fast idle screw on high step of cam.

UNLOADER: 9/32" (Gauge T109-126) between upper edge of choke valve and inner wall of air horn. To adjust: bend unloader arm on throttle lever.

SECONDARY THROTTLE LEVER: 1. Block choke valve wide open. 2. Back out throttle lever stop screw so that primary valves seat in bores of carbureter. 3. With primary valves open 11/64" (Gauge T109-166) secondary valves should just start to open. To adjust, bend throttle operating rod. NOTE: Secondary valves will be a few degrees from wide open, when primary valves are wide open. 4. With primary and secondary throttle valves tightly closed there should be .008" to .013" (Gauge T109-200) between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on primary throttle lever.

SECONDARY THROTTLE LOCK-OUT: Crack throttle valves and manually open and close choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. To adjust, bend tang on secondary throttle lever.

CARTER CARBURETOR

DIVISION OF ACF INDUSTRIES INCORPORATED
ST. LOUIS, MO., U. S. A.

CARTER MODEL WCFB CARBURETER FOR NASH (SERVICE ADJUSTMENT PROCEDURE)

NOTE: The parts and specification pages referred to are catalog pages. These pages can be obtained from Carter Carburetor, Catalog Department, St. Louis (7), Missouri. Specify the Carbureter number found on the brass identification tag, when requesting specification pages.

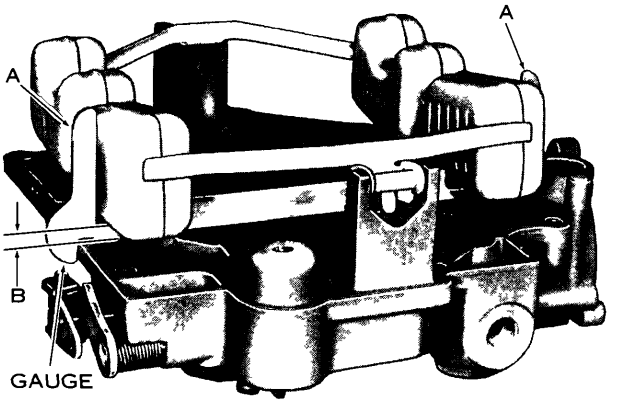

Figure 1

FLOAT ADJUSTMENT (Fig. 1):

1. Lateral – Place float guage directly under center of floats with notched portion of gauge fitted over edge of casting. Side of floats should just clear the vertical uprights (A) of float gauge. To adjust, bend arms of floats.
2. Vertical – With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance (B) between top of float and machined surface of casting must be as listed on carbureter specification page. To adjust, bend center portion of float arms.

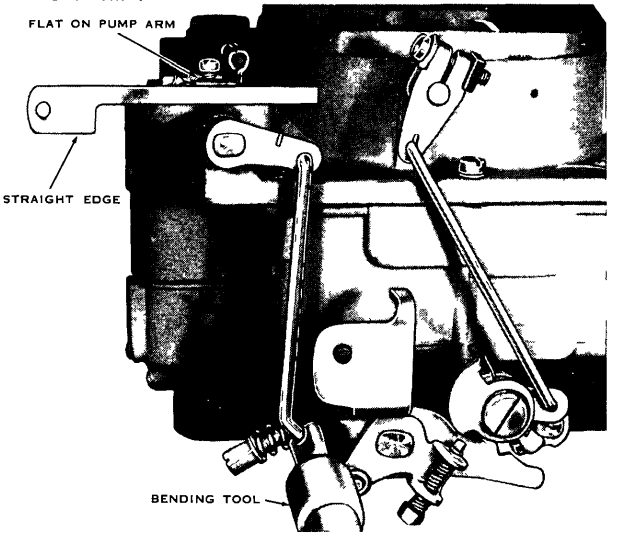

Figure 3

PUMP ADJUSTMENT (Fig. 3):

1. Install pump connector link in outer hole (long stroke) of pump arm with ends extending outward toward countershaft arm.
2. Back out throttle lever set screw until throttle valves seat in bores of carbureter.
3. Hold straight edg across top of dust cov r boss at pump arm. The flat on top of pump arm should b parall l to straight dg . To adjust, b nd throttle conn ctor rod at low r angle. (Us tool T109-213.)

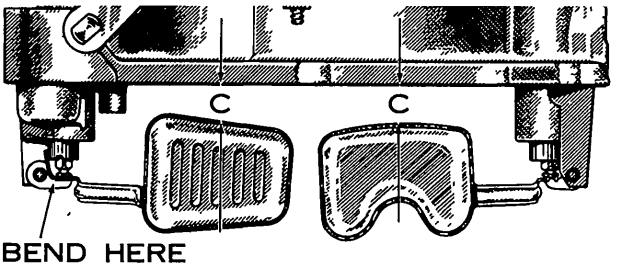

Figure 2

FLOAT DROP ADJUSTMENT (Fig. 2):

With bowl cover held in upright position and m asuring from center of floats, the distance (C) b tween top of floats and bowl cover should be as listed on carbur ter specification page. To adjust, bend stop tabs on float bracket.

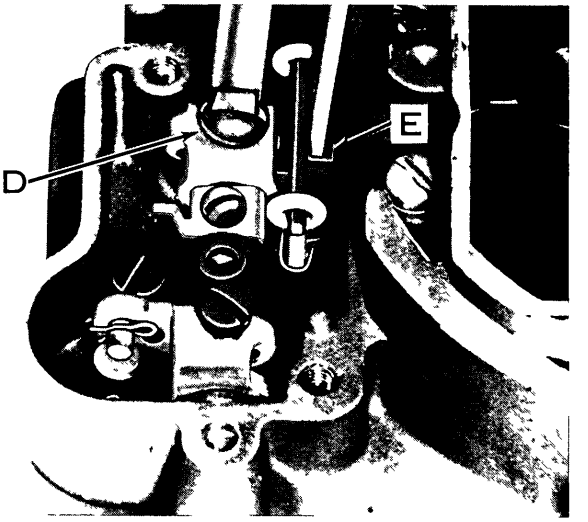

Figure 4

METERING ROD ADJUSTMENT (Fig. 4):

1. Back out throttle lever set screw to allow throttl valves to seat in bores of carbur t r and loos n metering rod arm clamp screw (D).
2. Press down on vacumeter link until m tering rods bottom in carbureter body casting.
3. Holding rods in downward position and throttl valv s s at d, r volv m t ring rod arm until finger on arm contacts lip (E) of vacumeter link. Hold in plac and car fully tighten clamp screw (D).

CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

S S PRINTED IN U.S.A.

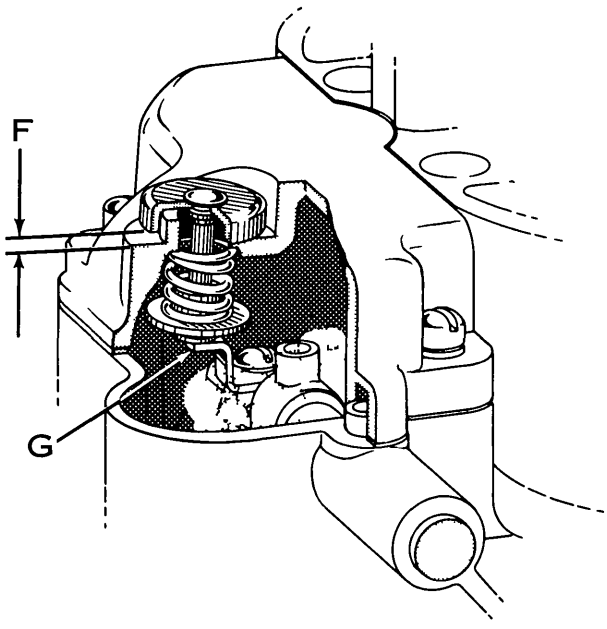

Figure 5

BOWL VAPOR VENT ADJUSTMENT (Fig. 5):

1. Install dust cover and dust cover gasket.

2. With throttle valves seated, there should be the clearance (F) as listed on carbureter specification page between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm (G).

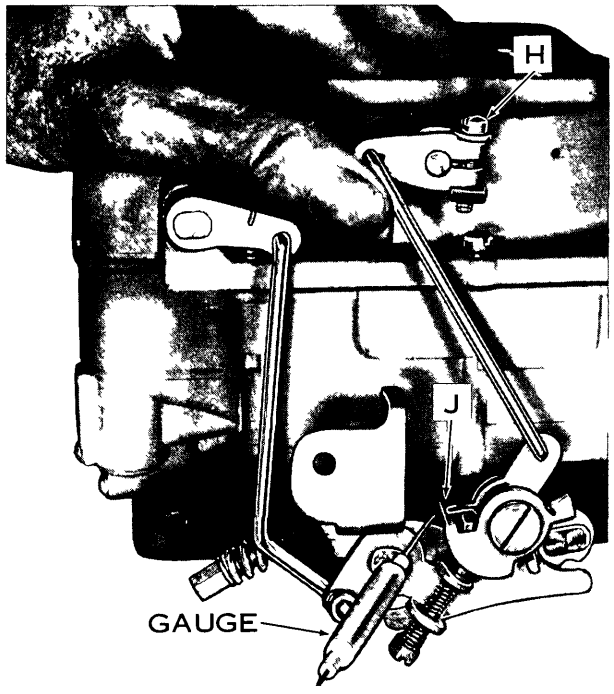

Figure 6A

FAST IDLE CAM CLEARANCE ADJUSTMENT (Fig. 6A):

1. Loosen choke lever clamp screw (H) on choke shaft and insert gauge as listed on specification page between lip of fast idle cam and boss of flange casting (J).

2. Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position - hold in place and tighten clamp screw (H).

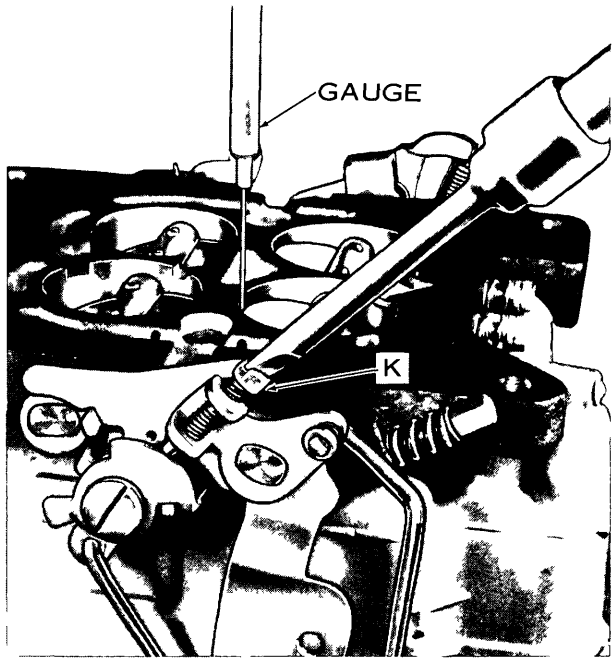

Figure 6B

FAST IDLE THROTTLE VALVE CLEARANCE ADJUSTMENT (Fig. 6B):

With choke valve tightly closed, tighten fast idle adjusting screw (K) (on high step of cam) until there is the clearance as listed on carbureter specification page between throttle valve and bore of carbureter, side opposite idle port.

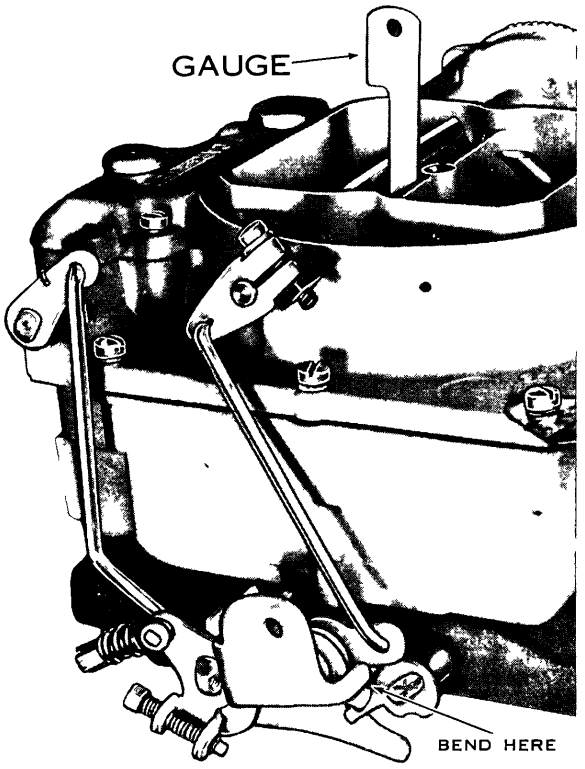

Figure 7

UNLOADER ADJUSTMENT (Fig. 7):

With throttle wide open there should be the clearance as listed on carbureter specification page between upper edge of choke valve and inner wall of air horn. To adjust, bend unloader lip on throttle shaft lever. (Use tool T109-41)

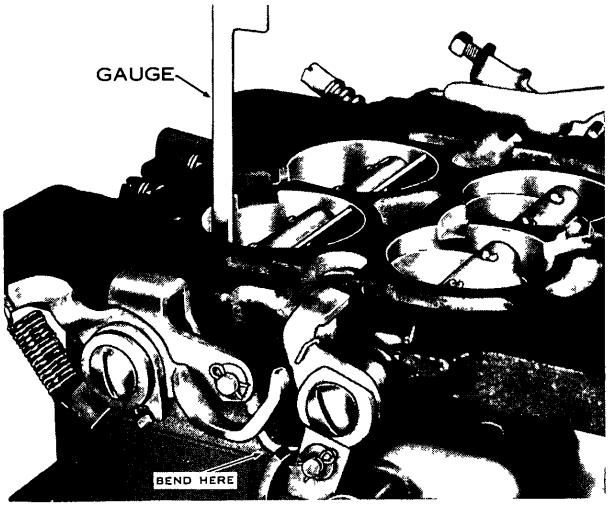

Figure 8A

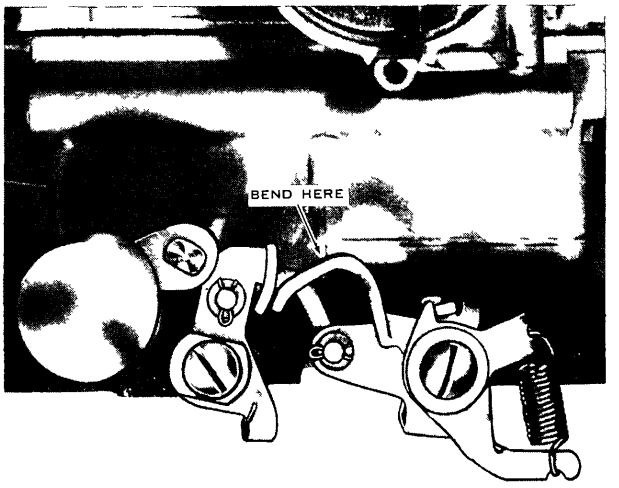

Figure 8B

SECONDARY THROTTLE LEVER ADJUSTMENT (Figs. 8A & 8B):

1. Block choke valve wide open.
2. Back out throttle lever stop screw so that primary valves seat in bores of carbureter.
3. Secondary throttle valves should just start to open when primary throttle valves are opened to the clearance as listed on specification page between upper edge of valve and bore (next to idle port). To adjust, bend throttle operating rod. (Use bending tool T109-213.) (See Fig. 8A.) NOTE: Secondary throttle valves will be a few degrees from wide open position, when primary valves are wide open.
4. With primary and secondary throttle valves in tightly closed position, there should be the clearance as listed on specification page between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on primary lever. (See Fig. 8B.)

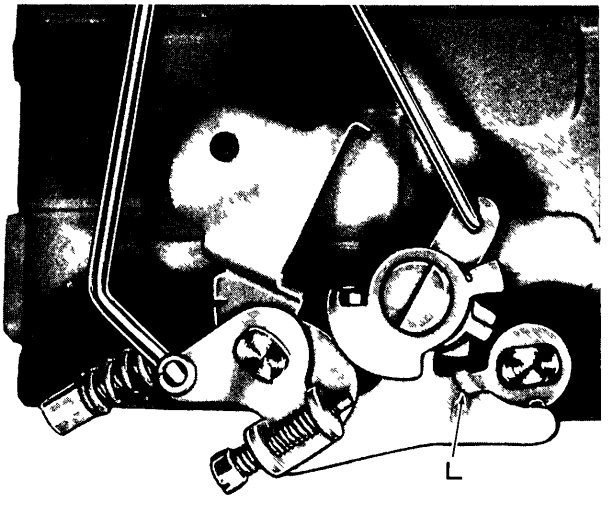

Figure 9

SECONDARY THROTTLE LOCK-OUT ADJUST ADJUSTMENT (Fig. 9):

Crack throttle valves and manually open and close the choke valve. Tang (L) on secondary throttle lever should freely engage in notch of lock-out dog. If necessary to adjust, bend tang (L) on secondary throttle lever.

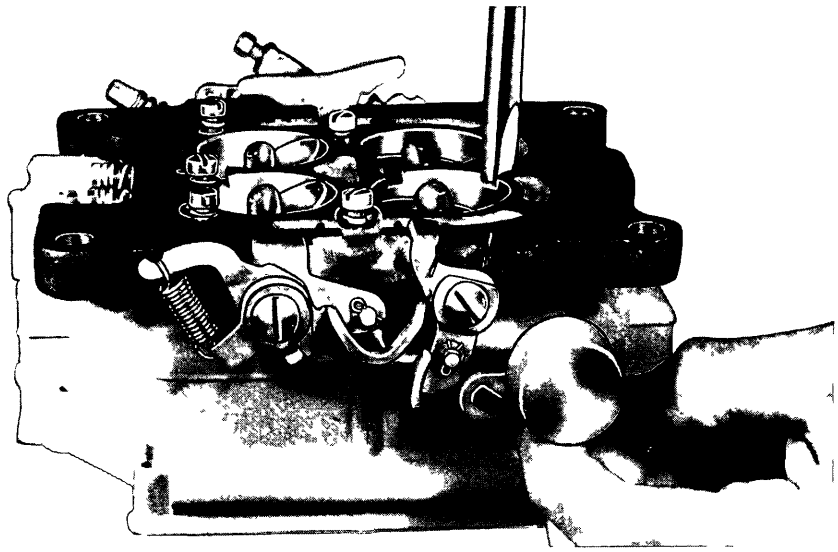

Figure 10

When assembling carbureter make sure auxiliary throttle valves are in closed position before tightenting flange attaching scr ws. (See Fig. 10)

Inspect gasketed surfaces between body and air horn, and between body and flange. Small nicks or burrs should be smoothed down to eliminate air or fuel leakage. Be especially particular when inspecting the top surface of the inner wall of the bowl around the choke suction passage. A poor seal at this location may contribute to a "cutting-out" on turns complaint.

Fill th carbureter bowl with clean fuel before installing on the manifold. This will help prevent dirt trapped in the fuel system from being dislodged by the free flow of fuel as the carbureter is primed. The operation of the floats and intake needle and seats may be checked under pressure if a fuel pump is used at the bench to fill the carburet r bowl. Operate the throttle several times and visually check the discharge from the pump jets.

Before installing the carbureter, hold choke valve open and turn the idle speed screw until it just contacts the throttle lever, then 1/2 of a turn more to open the throttle valves enough to keep the engine running until the idle mixture and final R.P.M. adjustment can be made.

(2586S can also be used)

WCD DUAL DOWN-DRAFT CLIMATIC® CONTROL **CARBURETER N . 2350S**

CARBURETER SPECIFICATIONS

For Nash 6 Cylinder Engine: 3 1/8 Inch Bore, 4 1/4 Inch Stroke

Dimensions: Flange size, 1 1/4 inch dual, 4 bolt type.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 21/32 inch I. D.
Main venturi, 1-1/16 inch I. D.

Vents: Inside, (in air horn) (1).
Outside, (in dust cover) (1).

Gasoline Intake: Square vertical needle. Size No. 38 (.1015 inch) drill in needle seat.

Low Speed Jet Tube: Jet size, No. 71 (.026 inch) drill.
By-pass, size .051 inch diameter.
Economizer, size No. 56 (.0465 inch) drill.
Idle bleed, size .051 inch diameter.

Idle Ports: Upper port, length, .105 inch. Width, .030 inch.

Idle Port Opening: .074 to .080 inch above upper edge of valve with valve closed tight.

Lower Port (For Idle Adjustment Screw): Size .0615 to .0655 inch diameter.

Set Idle Adjustment Screw: 1/2 to 1 1/2 turns open. For richer mixture turn screw out. Do not idle engine below 475 r.p.m. (Hydra. Trans.) in neutral, 550 r.p.m. (Std. and Overdrive Trans.).

Main Nozzle: In primary venturi, closed tip. Nozzle is installed permanently. Do not remove.

Metering Rod: Economy step .0725 inch diameter, middle step tapers to .064 inch diameter. Power step .0618 inch diameter. These rods are designed with idle stabilizing flat on economy step.

Metering Rod Jet: .089 inch diameter.

Accelerating Pump: Discharge jet (twin) size, No. 67 (.032 inch) drill.
Intake ball check seat size .115 to .120 inch diameter.
Discharge (needle seat) size, No. 50 (.070 inch) drill.

Choke: Carter Climatic® Control, set on index. Offset butterfly type. Choke heat suction hole, in bowl cover. Size No. 36 (.1065 inch) drill.

Vacuum Spark Port: Round type, .040 inch diameter. Top of port .033 to .043 inch above valve, with valve tightly closed.

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .030"	Breaker Point Setting .020"	Ignition Timing Breaker Points to Open: T. D. C. At Vibration Damper	Valve Setting (Hot) Intake .012" Exhaust .016"	Float Setting 5/32 Inch (Use Gauge T109-196)	Idle Adjustment Screw Setting 1/2 to 1 1/2 Hydramatic Trans. (In Neutral) 475 R.P.M. Std. & O'Drive 550 R.P.M.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical.

LATERAL ADJUSTMENT: With bowl cover assembly inverted, bowl cover gasket removed, place float gauge directly under floats with notched portions of gauge fitted over edges of casting. Sides of floats should barely touch the vertical uprights of float gauge. Adjustment should be made by bending arms of floats.

VERTICAL ADJUSTMENT: With float gauge in same position, floats should just clear the horizontal portion of gauge. (Vertical distance between top of float and machined surface of casting must be 5/32 inch.) (Gauge T109-196.) Adjust by bending float arms. Remove floats, install bowl cover gasket and then reinstall floats.

PUMP ADJUSTMENT: Install pump connector link in outer hole (long stroke) of pump arm, with ends extending away from countershaft arm. Back out throttle lever set screw until throttle valves seat in bores of carbureter Be sure fast idle adjusting screw does not hold throttle open. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at upper angle. Use tool T109-213.

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. 2. With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. 3. Holding rods in

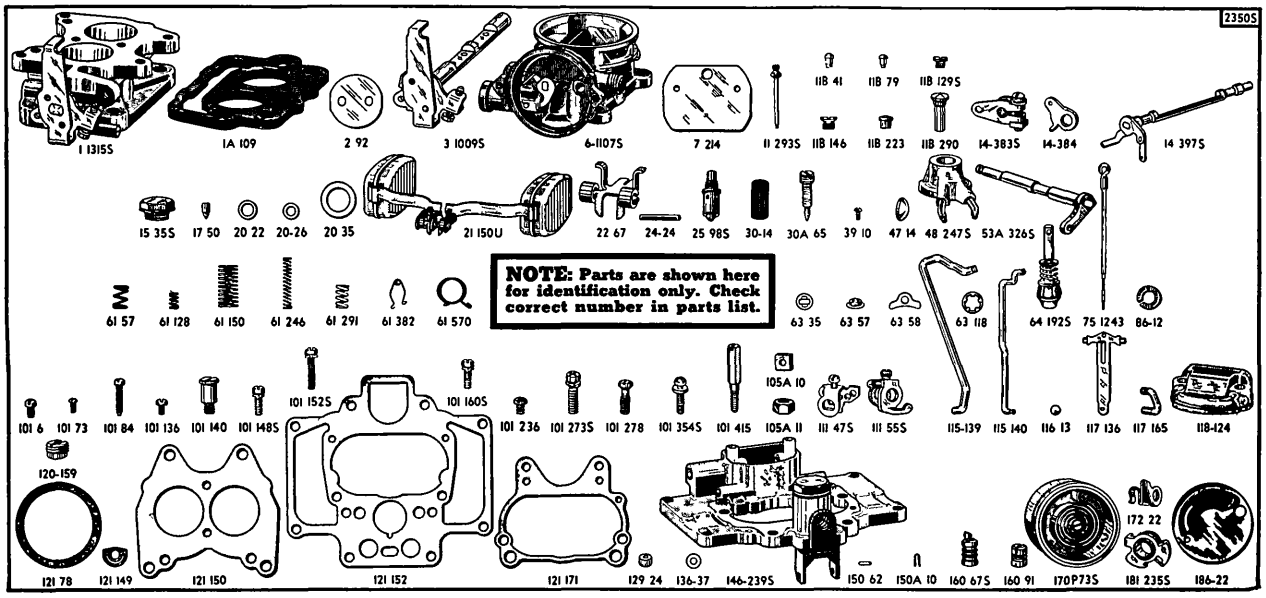
CARBURETER
TRADE MARK REG. U. S. PAT. FF.
MARCA REGISTRADA



PRINTED IN U.S.A.

downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link Hold in place and carefully tighten clamp screw

FAST IDLE ADJUSTMENT Loosen choke lever clamp screw on choke shaft Insert 010 inch feeler gauge T109-200 between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw

With choke valve tightly closed, tighten fast idle adjusting screw until there is 020 inch (gauge T109-29) opening between throttle valve and bore of carbureter (side opposite idle port) Be sure fast idle adjusting screw is on high step of cam while making this adjustment

UNLOADER ADJUSTMENT With throttle wide open there should be 3/16 inch (gauge T109-28) clearance between upper edge of choke valve and inner wall of air horn Adjust by bending unloader lip on throttle shaft lever (Use bending tool T109-41)

Nash 6—1956-1957—Carbureter No. 2350S

YH Horizontal Climatic® Control **Carbureter No. 2369S**

CARBURETER SPECIFICATIONS

For Nash 6 Cylinder Engine 3½ Inch Bore, 4⅜ Inch Stroke

Dimensions Flange size 1¼ inch 3 bolt
Primary venturi 11/32 inch I D
Secondary venturi 11/16 inch I D
Main venturi 1 5/16 inch I D

Vents Outside none Inside balance vent tube to air horn ahead of choke valve

Gasoline Intake Spring loaded needle Size No 51 (067 inch) drill hole in needle seat

Low Speed Jet Tube Jet size No 65 (035 inch) drill
By pass in body size No 55 (052 inch) drill
Economizer size No 58 (042 inch) drill

Idle Ports Upper port slot type length 162 inch Width 030 inch

Idle Port Opening Top of port 124 to 128 nch above top edge of valve with valve tightly closed Lower port size 0615 to 0655 inch diameter (for idle adjusting screw)

Set Idle Adjustment Screw ¼ to 1¾ turns open For richer mixture turn screw out Do not idle engine below 550 r p m (std and Overdrive Trans) 475 r p m (Hydramatic—in neutral) For cars with air conditioning set idle at 500 r p m with compressor in operation

Main Nozzle In primary venturi DO NOT REMOVE Anti percolating jet (in tube) to nozzle size No 70 (028 inch) drill

Metering Rod (Diaphragm Type) Economy step 071 inch diameter middle step tapers to 063 inch diameter, power step 063 inch diameter

Metering Rod Jet 089 inch diameter

Accelerating Pump Diaphragm type vacuum and mechanically operated Discharge (pump) jet size No 76 (020 inch) drill Intake ball check (in diaphragm housing) seat size 115 120 inch diameter Discharge needle check (in body) seat size 092 inch diameter Vacuum passage restriction (plug in body) size No 46 (081 inch) drill Vacuum bleed (to throttle bore) size No 65 (035 inch) drill

Choke Carter Climatic® Control set two points lean Butterfly type offset choke valve Choke heat suction hole in piston housing size No 42 (0935 inch) drill

Vaccum Spark Port Slot type Size 125 by 041 inch Bottom of horizontal port 026 to 036 inch above top edge of valve in closed position

Motor Tune-Up—Be Accurate!

CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter

Spark Plug Gap	Breaker Point Setting	Ignition Timing Breaker Points to Open	Valve Setting (Hot)	Float Setting	Idle Adjustment Screw Setting
030"	020"	4° A T D C	Intake 012" Exhaust 016"	7/16 Inch (Use Gauge T109-81)	¼ to 1¾ Std and O Drive 550 R P M Hydramatic (In Neutral) 475 R P M

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT With gasket removed bowl cover assembly inverted and float resting on pin in seated needle the distance from the bowl cover to the top of float should be 7/16 inch (gauge T109-81) Do not depress float lip against spring loaded pin in needle but let float rest of its own weight Adjust by bending float lever Float setting must be checked with bowl cover held at eye height in a level position

FLOAT DROP With bowl cover assembly held in upright position the distance between bottom of float (at free end) and bowl cover should be 2⅜ Adjust by bending stop tab on float arm

METERING ROD ADJUSTMENT This adjustment is important and should be checked each time the carbureter is reassembled Insert gauge (Tool T109 104) in place of metering rod seating tapered end of gauge in metering rod jet

CARBURETER
TRADE MARK REG U S PAT OFF.
MARCA REGISTRADA

Hold gauge vertical to insure seating in jet With throttle valve tightly closed, press down on diaphragm shaft until metering rod arm contacts lifter link at diaphragm stem With diaphragm shaft held in this position metering rod pin must rest lightly on metering rod gauge To adjust, bend metering rod arm Use bending tool T109-22

ACCELERATING PUMP If acceleration is not satisfactory, remove pump housing, intake rivet plug and ball check Examine diaphragm for wear or damage Be sure intake check ball and discharge check needle seats are not clogged with lint or foreign matter Intake ball check and discharge needle must seat, as a leak at these points will result in poor acceleration Inspect and replace all worn parts, clean and blow out all passages with compressed air Pump jet is permanently installed, do not remove

FAST IDLE ADJUSTMENT With thermostatic coil housing gasket and baffle plate removed, partial open throttle close choke valve and then close throttle valve This will allow the fast idle cam to revolve to fast idle position With choke valve held tightly closed and slight tension on throttle lever there should be 018 (Gauge T109-44) clearance between throttle valve and bore of carbureter (side opposite idle port) Adjust by bending connector link at lower angle

UNLOADER ADJUSTMENT This adjustment must be made after fast idle adjustment Hold throttle valve in wide open position and close choke valve as far as possible without forcing There should be 5/8 inch clearance between lower edge of choke valve (vent tube side) and inner wall of air horn (Gauge T109-85) Adjust by bending choke shaft unloader arm (Use bending tool T109-105)

WGD Dual Down-Draft Climatic® Control **Carbureters Nos. 2231S-2231SA**

CARBURETER SPECIFICATIONS

For Nash 8 Cylinder Engine: 3-13/16 Inch Bore, 3½ Inch Stroke

Dimens ons: Flange size 1¼ inch dual, 4 bolt type
Primary venturi 11/32 inch I D
Secondary venturi 21/32 inch I D
Main venturi 1 3/16 inch I D

Float Level: See adjustments

Vent: Outside, none Inside balance vent tube above choke valve

Gasoline Intake: Size No 42 (0935 inch) drill in needle seat

Low Speed Jet Tube: Jet size No 69 (0292 inch) drill
By pass in bowl cover, size No 56 (0465 inch) drill
Economizer in bowl cover size No 55 (052 inch) drill
Idle bleed in bowl cover, size No 53 (0595 inch) drill

Idle Port: Upper, slot type length 160 inch width 030 inch

Idle Port Opening: 109 to 115 inch above top edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw): Size 065 to 069 inch diameter

Set Idle Adjustment Screw: ½ to 1½ turns open For richer mixture turn screw out Do not idle engine below 450 RPM in neutral

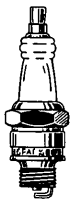
Nozzle: Nozzle is installed permanently DO NOT REMOVE Anti-percolating well jet size No 70 (028 inch) drill

Metering Rod (Vacumeter Type): Economy step, 0665 inch di ameter Power step 040 inch diameter These rods designed with idle stabilizing flats on economy step

Metering Rod Jet: Size 089 inch diameter

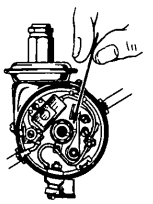
Metering Rod Setting: See adjustments

Accelerating Pump: Discharge jet (twin) size No 72 (025 inch) drill
Intake ball check in plunger shaft
Discharge (needle seat) size No 50 (070 inch) drill



Pump Adjustment: See adjustments

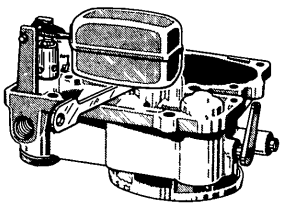
Choke: Carter Climatic® Control—set one point rich butterfly type offset valve Choke heat suction hole in piston housing size No 42 (0935 inch) drill



Vacuum Spark Port: Horizontal slot (round end) 040 x 130 inch Bottom of port to be (2231S) 038 to 044 inch, (2231SA) 018 to 024 inch above upper edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .035"

Breaker Point Setting .016"

Ignition Timing Breaker Points to Open: 5° B.T.D.C.

Float Setting See Adjustments

Idle Adjustment Screw Setting ½ to 1½ Turns Open Idle engine at 450 R.P.M. in neutral.

NOTE: These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT.

Float Adjustment

FLOAT ADJUSTMENT (Fig. 1):

With bowl cover gasket removed, bowl cover inverted and needle seated, there should be 1/4 inch (A) (gauge T109-31) between top of float and bowl cover. Adjust by bending float arm.

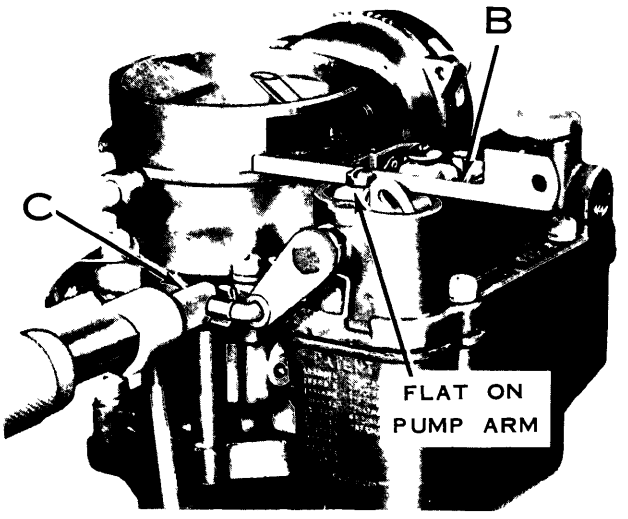

Figure 2
Pump Adjustment

PUMP ADJUSTMENT (Fig. 2):

Back out throttle lever set screw until throttle valves seat in bores of carbureter. Hold straight edge (B) across top of dust cover at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at upper angle (C). Use bending tool T109-213.

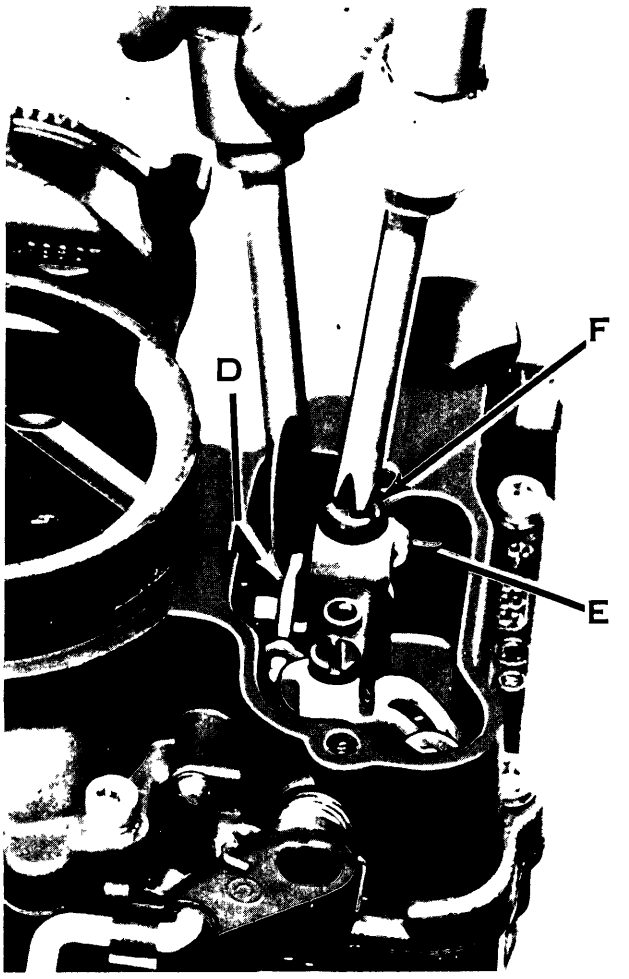

Figure 3
Metering Rod Adjustment

METERING ROD ADJUSTMENT (Fig. 3):

The metering rods must be adjusted after the pump adjustment No metering rod gauges are necessary; procedure is as follows: With the throttle lever set screw backed out and throttle valves seated in bores of carbureter, press down on vacumeter link (D) until metering rods bottom in casting. With rods held in this position, revolve metering rod arm (E) until lip contacts vacumeter link. Hold in place and carefully tighten metering rod arm set screw (F).

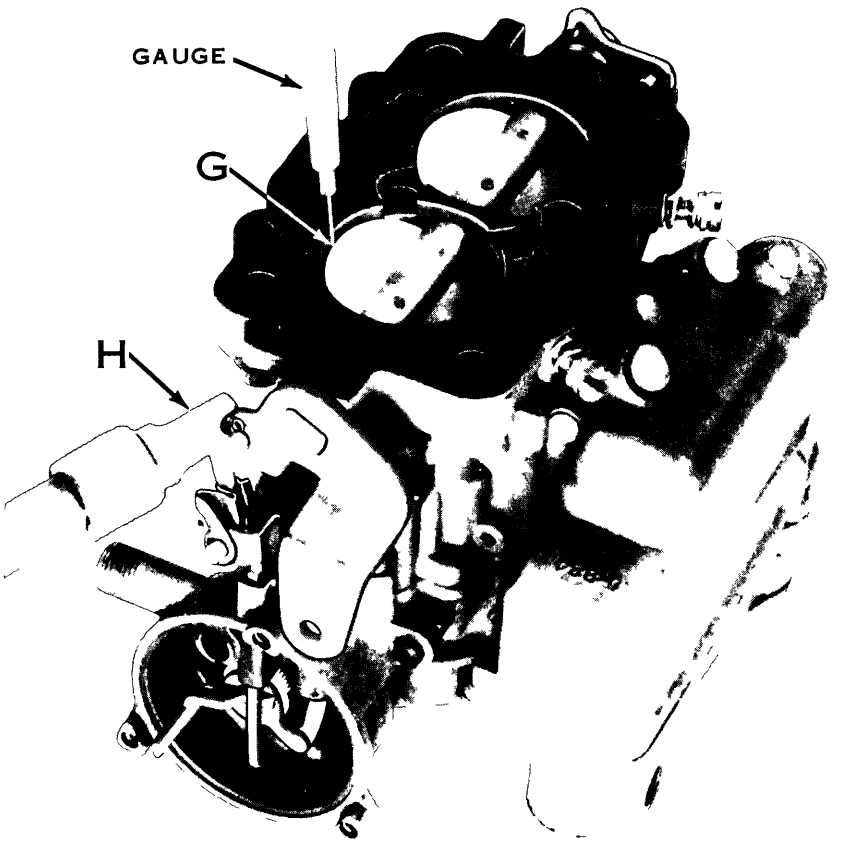

Figure 4
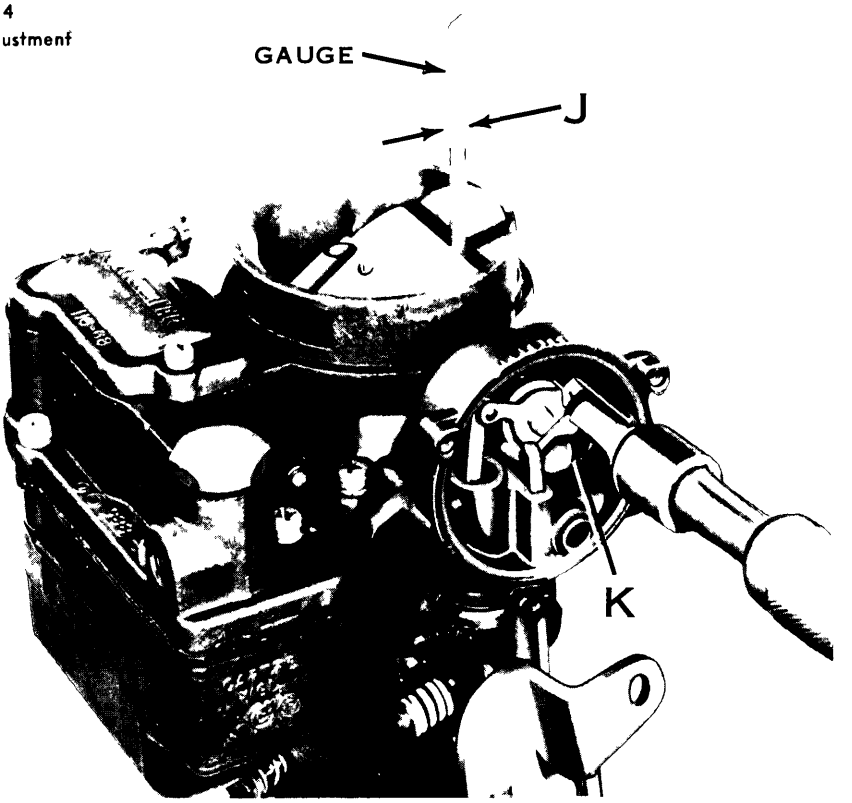
Fast Idle Adjustment

FAST IDLE ADJUSTMENT (Fig. 4):

With the thermostatic coil housing gasket and baffle plate removed crack throttle valve and hold choke valve closed Then close throttle There should now be 030 inch clearance (G) (gauge T109 29) between throttle valve and bore of carbureter (side opposite idle port) Adjust by bending the choke connector rod at lower angle (H)



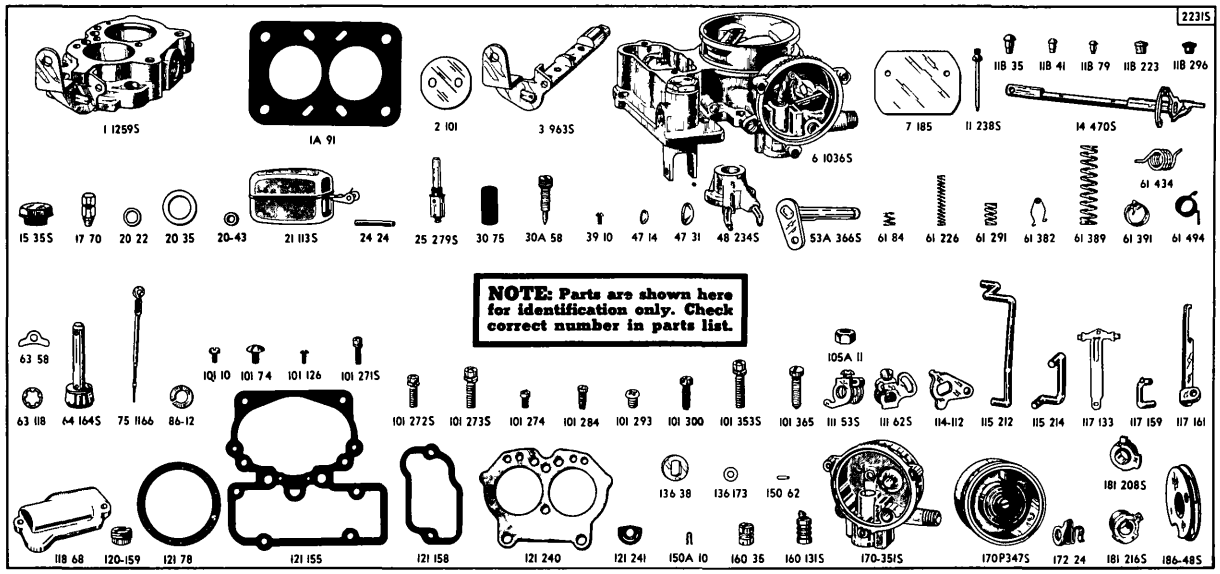


Figure 5
Unloader Adjustment

UNLOADER ADJUSTMENT (Fig. 5):

This adjustment must be made after fast idle adjustment Hold throttle valve in wide open position and close choke valve as far as possible without forcing There should be 3/16 inch (gauge T109-28) clearance (J) between upper edge of choke valve and inner wall of air horn Adjust by bending choke shaft unloader arm (K) (Use bending tool T109 213).

WCD DUAL DOWN-DRAFT CLIMATIC® CONTROL **CARBURETER No. 2061S**

CARBURETER SPECIFICATIONS

For Nash 6 Cylinder Engine. 3 1/8 Inch Bore, 4 1/4 Inch Stroke

Dimensions: Flange size 1 inch dual 3 bolt type
Primary venturi, 11/32 inch I D
Secondary venturi, 21/32 inch I D
Main venturi 1-1/16 inch I D

Float Level: See adjustments

Gasoline Intake: Size No 42 (0935 inch) drill

Vent: Inside two-balance vent tube in air horn Outside, none

Low Speed Jet Tube: Jet, size No 70 (028 inch) drill By pass, size 051 inch diameter
Economizer size No 58 (042 inch) drill
Idle bleed size 051 inch diameter

Idle Port: Upper, slot type, length 162 inch, width 030 inch

Idle Port Opening: 117 to 123 inch above upper edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw). Size 0615 to 0655 inch diameter

Set Idle Adjustment Screw: 1/2 to 1 1/2 turns open For richer mixture turn screw out Do not idle engine below 550 r.p m (Syncro-mesh trans), 450 r p m. (Hydra-matic trans.) in neutral 500 r p m (Hydra matic with air conditioner) in neutral.

Main Nozzle: Nozzle is installed permanently Do Not Remove

Metering Rod (Vacumeter Type): Economy step 0772 inch diameter Middle step tapers to 071 inch diameter Power step 057 inch diameter

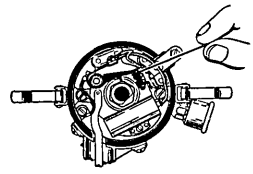
Metering Rod Jet: Size 091 inch diameter

Metering Rod Setting: See adjustments

Accelerating Pump: Discharge jet (twin), size No 74 (0225 inch) drill
Intake disk check size No 30 (1285 inch) drill
Discharge needle seat size No 50 (052 inch) drill

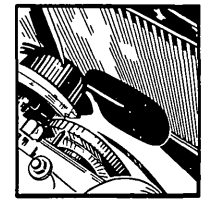
Pump Adjustment: See adjustments

Choke: Carter Climatic® Control set 2 points lean Butterfly type offset valve Choke heat suction hole in bowl cover, size No 44 (086 inch) drill

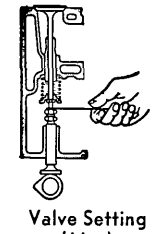


Vacuum Spark Port: Round type 039 to 041 inch diameter Top of port 033 to 038 inch above valve with valve tightly closed.

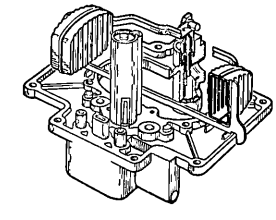
Motor Tune-Up—Be Accurate!



CAUTION. Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .030"



Breaker Point Setting .020"

Ignition Timing Breaker Points to Open: 4° A.T.D.C.

Valve Setting (Hot) Intake .015" Exhaust .015"

Float Setting See Adjustments

Idle Adjustment Screw Setting 1/2 to 1 1/2 Turns Open Idle Engine at 550 R.P.M. (Syncromesh Trans) 450 R P.M. (Hydramatic Trans) in Neutral, 500 R.P.M. (Hydramatic with Air Conditioner) in Neutral

CARBURETER ADJUSTMENTS

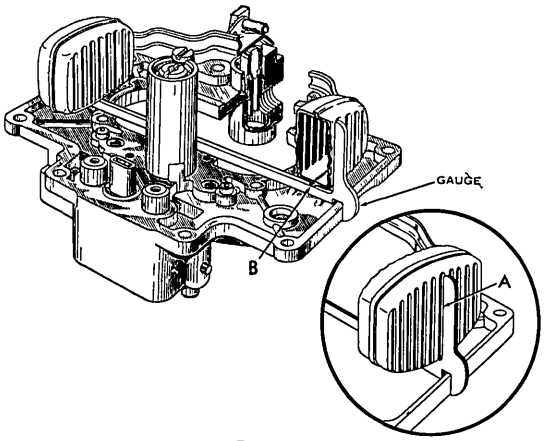

Figure 1
Float Adjustment

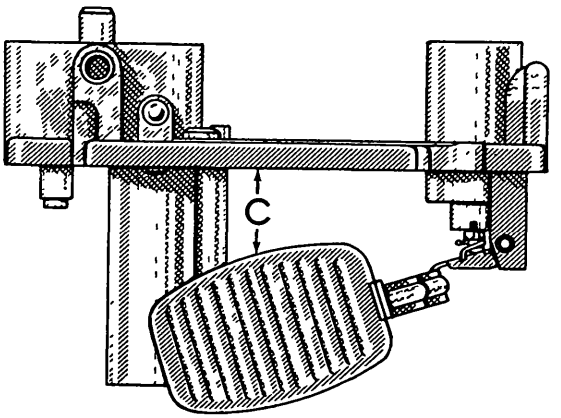

Figure 2
Float Drop Adjustment

FLOAT ADJUSTMENT (Fig. 1)

Two separate float adjustments must be made—lateral and vertical

LATERAL ADJUSTMENT: With bowl cover assembly inverted bowl cover gasket removed, place float gauge (T109 196) directly under floats with notched portions of gauge fitted over edges of casting Sides of floats should barely touch the vertical uprights of float gauge (A) Adjustment should be made by bending arms of floats

VERTICAL ADJUSTMENT: With float gauge in same position, floats should just clear the horizontal portion of gauge (Vertical distance (B) between top of float and machined surface of casting must be 5/32 inch) Adjust by bending float arms Remove floats install bowl cover gasket and then reinstall floats

FLOAT DROP ADJUSTMENT (Fig. 2):

With bowl cover held in upright position, the distance (C) between top of floats at center and bowl cover should be 5/8 inch Adjust by bending stop tab on float bracket

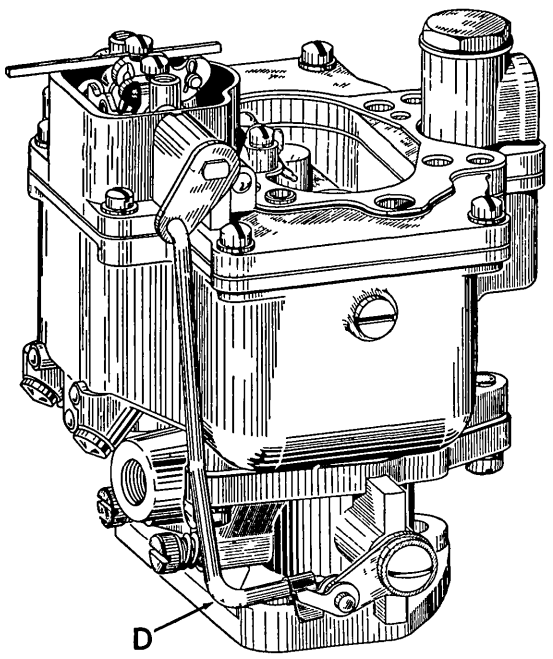

Figure 3
Pump Adjustment

PUMP ADJUSTMENT (Fig. 3).

Back out throttle lever set screw until throttle valves seat in bores of carbureter Be sure fast idle adjusting screw does not hold throttle open Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at lower angle (D) Use Tool T109-213

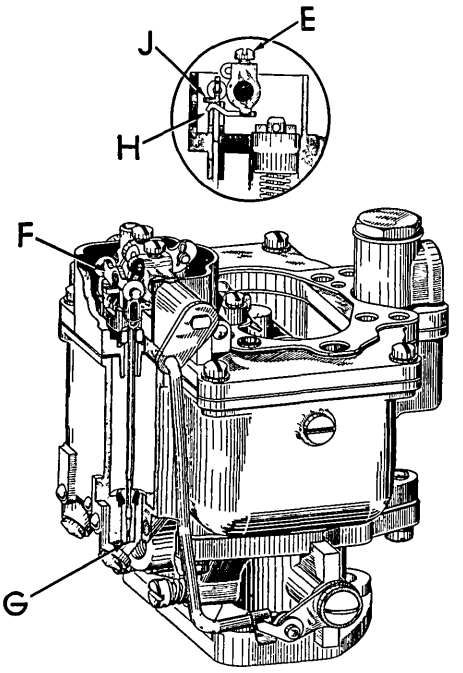

Figure 4
Metering Rod Adjustment

METERING ROD ADJUSTMENT (Fig. 4):

Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows:

1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw (E).
2. With metering rods in place, press down on vacumeter link (F) until metering rods bottom in carbureter body casting (G).
3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger (H) on arm contacts lip (J) of vacumeter link. Hold in place and carefully tighten clamp screw (E).

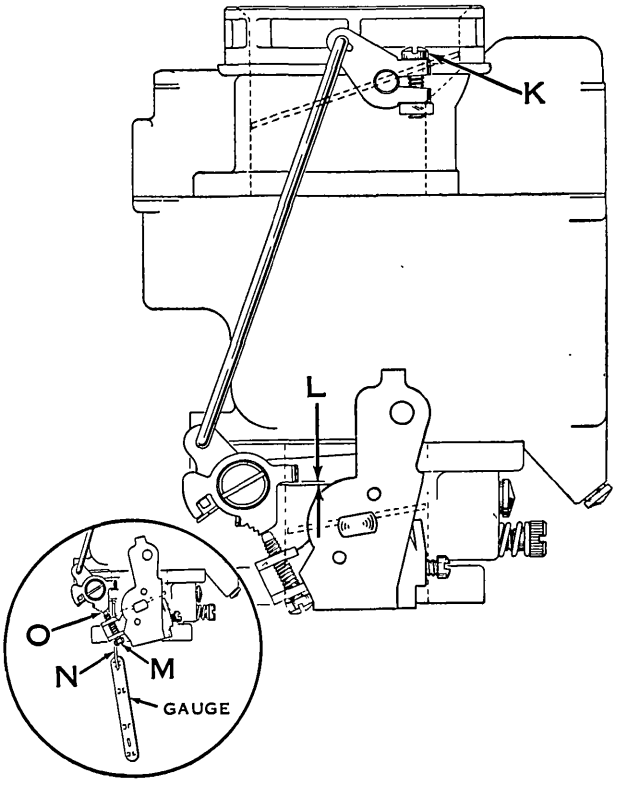

Figure 5
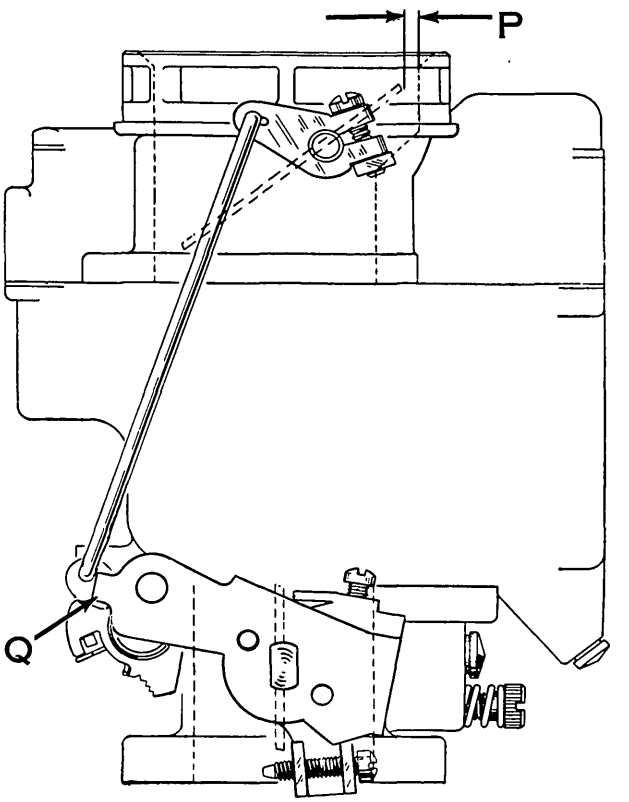
Fast Idle Adjustment

FAST IDLE ADJUSTMENT (Fig. 5):

Loosen choke lever clamp screw (K) on choke shaft. Insert .005 inch feeler gauge T109-237 between lip of fast idle cam and boss of flange casting (L). Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw (K).

With choke valve tightly closed, tighten fast idle adjusting screw (M) until there is .026 inch (gauge T109-189) opening between throttle valve and bore of carbureter (side opposite idle port) (N). Be sure fast idle adjusting screw is on high step of cam (O) while making this adjustment.



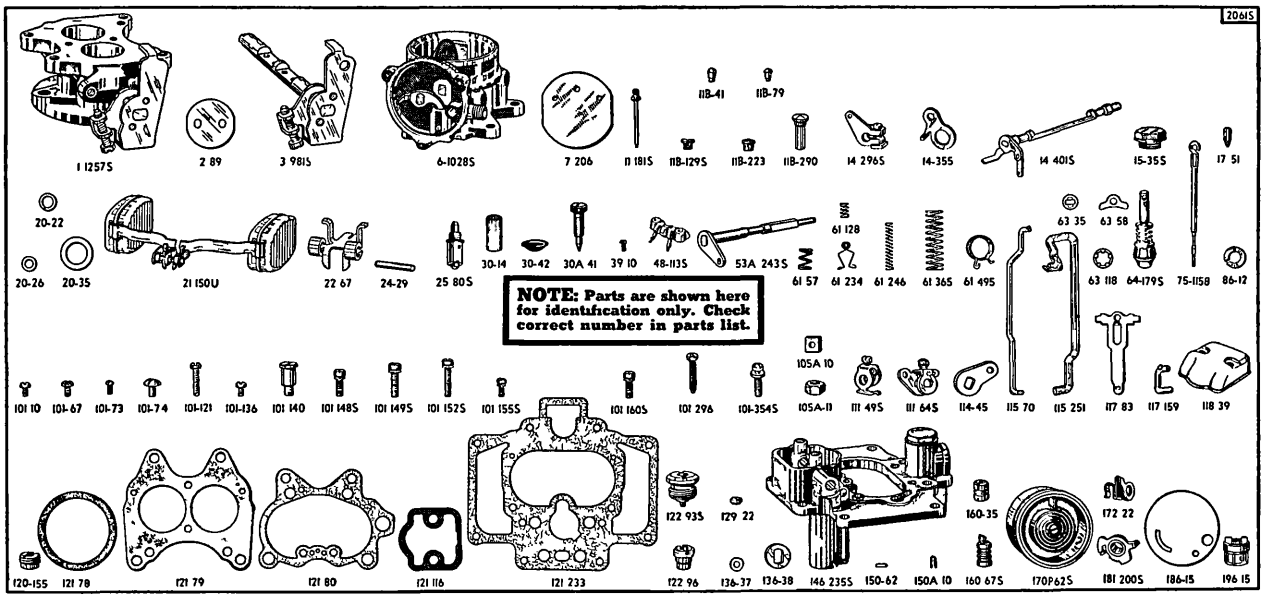


Figure 6
Unloader Adjustment

UNLOADER ADJUSTMENT (Fig. 6):

With throttle wide open there should be 11/64 inch (Gauge T109-166) clearance (P) between upper edge of choke valve and inner wall of air horn. Adjust by bending unloader lip (Q) on throttle shaft lever (Use bending tool T109-41).

Float Setting (See Adjustments)

Idle Adjustment Screw Setting ½ to 1¾ Turns Open

CARBURETER ADJUSTMENTS

Float Adjustment With gasket removed bowl cover assembly inverted and float resting on seated needle, the distance from the bowl cover to the top of float at free end should be (2098S-2137S-2137SA) (solid needle) ⅜ inch (gauge T109-80), (2098S-2137S-2137SA-2163S) (spring loaded needle) ¼ inch (gauge T109-31) (2258S) (spring loaded needle) 5/16 inch (gauge T109-220) Adjust by bending lip of float not float arm Float setting must be checked with the bowl cover held at eye height in a level position

Metering Rod Adjustment This adjustment is important and should be checked each time the carbureter is reassembled or lean rods are installed With throttle valve seated in bore of carbureter press down on upper end of diaphragm shaft until diaphragm bottoms in vacuum chamber Tool T109-212 may be used to hold diaphragm shaft down while adjusting metering rod Metering rod should contact bottom of metering rod well and metering rod arm should contact lifter link at the outer end nearest the springs and

PRINTED IN U.S.A.

at supporting lug Adjust by bending lip of metering rod arm to which metering rod is attached, up or down

Accelerating Pump If acceleration is not satisfactory remove pump housing, intake check assembly and discharge check ball and spring Examine diaphragm for wear or damage Be sure intake screen intake check and discharge check are not clogged with lint or foreign matter Discharge check ball must seat, as a leak at this point will result in poor acceleration Inspect and replace all worn parts, clean and blow out all passages with compressed air

Fast Idle Adjustment. Remove thermostatic coil housing gasket and baffle plate Crack throttle valve, and hold choke valve fully closed then close throttle This will allow fast idle cam to revolve to fast idle position. With choke valve held tightly closed and throttle closed as far as possible, there should now be .024 inch clearance (gauge T109-189 may be used) between throttle valve and bore of carbureter (side opposite idle port) Adjust by bending connector link at lower angle (Use bending tool T109-213)

Unloader Adjustment This adjustment must be made after fast idle adjustment Hold throttle valve in wide open position and close choke valve as far as possible without forcing There should be 29/64 inch clearance between lower edge of choke valve and inner wall of air horn (gauge T109-81 may be used). Adjust by bending arm of choke trip lever (Use tool T109-214)

YH Horizontal Climatic® Control Carbureters **Nos. 973S** (Front), **974S** (Rear)

CARBURETER SPECIFICATIONS

For Nash 6 Cylinder Engine: 3½ Inch Bore, 4⅜ Inch Stroke

Dimensions Flange size Special 1¼ inch 3 bolt
Primary venturi, 11/32 inch I. D.
Secondary venturi, 11/16 inch I. D
Main venturi, 1-5/16 inch I. D

Float Level: See Adjustments

Vents: Outside, none Inside balance vent tube to air horn ahead of choke valve

Gasoline Intake: Spring loaded needle size 067 inch diameter hole in needle seat

Low Speed Jet Tube: Jet size No. 70 (.028 inch) drill. By-pass in body, size .0492 inch drill Idle bleed size No. 58 (.042 inch) drill Economizer, size No. 54 (055 inch) drill.

Idle Port: Upper port, slot type; length 162 inch. Width 030 inch

Idle Port Opening: Top of port: .124 to .128 inch above top edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw): Size .0615 to .0655 inch diameter

Set Idle Adjustment Screw: ¾ to 1¾ turns open. For richer mixture, turn screw out. Do not idle engine below 550 r.p.m (Std and Overdrive Trans) 450 r p m. (Hydramatic — in neutral) For cars with air conditioning set idle at 500 r p m. with compressor in operation

Main Nozzle: Nozzle is installed permanently **Do Not Remove.**

Metering Rod: Economy step 068 inch diameter; power step 051 inch diameter

Metering Rod Jet: 089 inch diameter

Metering Rod Setting: See Adjustments

Accelerating Pump: Diaphragm type, vacuum and mechanically operated Intake ball check (in diaphragm housing) seat size 115-.120 inch diameter Discharge ball check (in body) seat size 115-120 inch diameter. Vacuum passage restriction (in body) size No 46 (081 inch) drill. Vacuum bleed (to throttle bore) size No 65 (035 inch) drill.

Pump Adjustment: None

Choke: Carter Climatic® Control (170N 250S) set one point lean (170P-250S) set 2 points lean Butterfly type offset choke valve Choke heat suction hole, size No 42 (0935 inch) drill

Vacuum Spark Port: Slot type Size .125 by .041 inch. Lower edge of port .026 to .036 inch above top edge of valve, with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap	Breaker Point Setting	Ignition Timing Breaker Points to Open:	Valve Setting (Hot)	Float Setting	Idle Adjustment Screw Setting
.030"	.020"	1952-54—T. D. C. 1955—4° A. T. D. C.	Intake .012" Exhaust .016"	7/16 Inch (Use Gauge T109-81)	¾ to 1¾ Turns Open

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: With gasket removed, bowl cover assembly inverted and float resting on pin in seated needle, the distance from the bowl cover to the top of float should be 7/16 inch (gauge T109-81) Do not depress float lip against spring loaded pin in needle, but let float rest of its own weight. Adjust by bending float lever. Float setting must be checked with bowl cover held at eye height in a level position.

FLOAT DROP: With bowl cover assembly held in upright position, the distance between float seam (at free end) and bowl cover should be 2 inches. Adjust by bending stop tab on float arm

METERING ROD ADJUSTMENT: This adjustment is important and should be checked each time the carbureter is reassembled Insert (gauge T109-104) in place of metering rod, seating tapered end of gauge in metering rod jet. Hold

CARBURETER
TRADE MARK REG U S PAT OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.

gauge vertical to insure seating in jet With throttle valve **tightly closed, press down on diaphragm shaft until metering** rod arm contacts lifter link at diaphragm stem With diaphragm shaft held in this position metering rod pin must rest lightly on metering rod gauge To adjust bend metering rod arm Use bending tool T109-22

ACCELERATING PUMP If acceleration is not satisfactory remove pump housing, intake rivet plug and ball check Then remove discharge ball check and spring Examine diaphragm for wear or damage Be sure intake check and discharge check are not clogged with lint or foreign matter Intake and discharge ball checks must seat, as a leak at these points will result in poor acceleration Inspect and replace all worn parts, clean and blow out all passages with compressed air **Pump jet is permanently installed, do not remove**

FAST IDLE ADJUSTMENT With thermostatic coil housing, gasket and baffle plate removed, crack throttle valve, and **hold choke valve fully closed, then close throttle valve This** will allow the fast idle cam to revolve to fast idle position With choke valve held tightly closed and slight tension on throttle lever, there should be 015 inch (gauge T109-44) **clearance between throttle valve and bore of carbureter (side** opposite idle port) Adjust by bending connector link at lower angle (Use tool T109-213)

UNLOADER ADJUSTMENT This adjustment must be made after fast idle adjustment Hold throttle valve in wide open **position and close choke valve as far as possible without** forcing There should be 5/8 inch (gauge T109-85) clearance between lower edge of choke valve (vent tube side) and inner wall of air horn Adjust by bending choke shaft unloader arm (Use Bending Tool T109-105)

YH Horizontal **Carbureters Nos. 895S-895SA** With Climatic® Control

CARBURETER SPECIFICATIONS

For Nash 6 Cylinder Engine: 3½ Inch Bore, 4⅜ Inch Stroke

Dimensions: Flange size, 1¼ inch 3 bolt.
Primary venturi, 11/32 inch I. D
Secondary venturi, 11/16 inch I. D.
Main venturi, 1-5/16 inch I. D.

Float Level: Distance from float (at free end) to float chamber cover, with free weight of float on needle and spring to be ⅜ inch

Vents: Outside, none. Inside balance vent tube to air horn ahead of choke valve.

Gasoline Intake: Spring loaded needle. Size .076 inch diameter hole in needle seat.

Low Speed Jet Tube: Jet size No. 70 (.028 inch) drill.
By-pass in body, size 1.25 mm (.0492 inch) drill.
Economizer, size No. 54 (.055 inch) drill.
Idle bleed size No. 58 (.042 inch) drill.

Idle Ports: Upper port, slot type; length .162 inch. Width, .030 inch.

Idle Port Opening: Top of port: .124 to .128 inch, above top edge of valve with valve tightly closed. Lower port size: .0615 to .0655 inch diameter (for idle adjusting screw).

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture, turn screw out. Do not idle engine below 550 r.p.m (Std. and Overdrive Trans.); 450 r.p.m. (Hydramatic—in neutral). For cars with air conditioning set idle at 500 r.p.m. with compressor in operation.

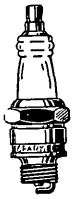
Main Nozzle: In primary venturi, angle 35° off vertical. Discharge jet size: .086 inch inside diameter.

Metering Rod (Diaphragm Type): Economy step, .0785 inch diameter; middle step tapers to .074 inch diameter; power step, .046 inch diameter. Length 2-31/32 inches.

Metering Rod Jet: .098 inch diameter.

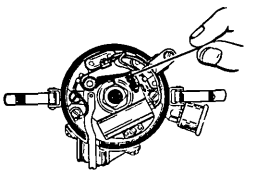
Metering Rod Setting: See adjustments.

Accelerating Pump: Diaphragm type, vacuum and mechanically operated. Discharge (pump) jet size No. 68 (.031 inch) drill (discharges in nozzle passage). Intake ball check (in diaphragm housing) seat size .115-.120 inch diameter. Discharge ball check (in body) seat size .115-.120 inch diameter. Vacuum passage restriction (in body) size No. 46 (.081 inch) drill. Vacuum bleed (to throttle bore) size No. 65 (.035 inch) drill.



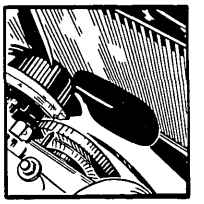
Pump Stroke: No adjustment.

Choke: Carter Climatic® Control; With 160-35 (one piece) choke piston, **set one point lean;** with 160-116S (two piece) choke piston **set one point rich.** Butterfly type, offset choke valve.



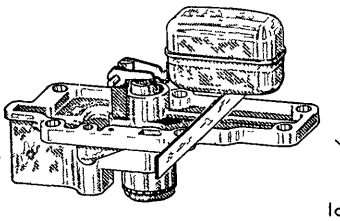
Vacuum Spark Port: Slot type. Size .125 by .041 inch. Bottom of horizontal port .026 to .036 inch above top edge of valve in closed position.

Motor Tune-Up—Be Accurate!

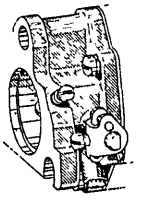


CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .030"



Breaker Point Setting .020"



Ignition Timing Breaker Points to Open:
(1952-53) T. D. C.
(1954-55) 4° A. T. D. C.

Valve Setting (Hot)
Intake .012"
Exhaust .016"

Float Setting ⅜ Inch (Use gauge T109-80)

Idle Adjustment Screw Setting ½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

Float Adjustment: With gasket removed, bowl cover assembly inverted and float resting on pin in seated needle, the distance from the bowl cover to the top of float should be ⅜ inch (gauge T109-80). Do not depress float lip against spring loaded pin in needle, but let float rest of its own weight. Adjust by bending float lever. Float setting must be checked with bowl cover held at eye height in a level position.

Float Drop: With bowl cover assembly held in upright position, the distance between float seam (at free end) and bowl cover should be 2". Adjust by bending stop tab on float arm.

Metering Rod Adjustment: This adjustment is important and should be checked each time the carbureter is reassembled. Insert gauge (Tool T109-104) in place of metering rod,

YF Down-Draft Climatic® Control **Carbureters Nos. 876S-876SA-877S-877SA-2014S**

CARBURETER SPECIFICATIONS

For Nash 6 Cylinder Engine: 3⅛ Inch Bore, 3¾ Inch Stroke (Rambler 1951-1952)
For Nash 6 Cylinder Engine: 3⅛ Inch Bore, 4 Inch Stroke (Statesman 1951, Rambler 1953)
For Nash 6 Cylinder Engine: 3⅛ Inch Bore, 4¼ Inch Stroke (Statesman 1952, Rambler 1954-1955)

Dimensions: Flange size, 1¼ inch S. A. E.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 11/16 inch I. D.
Main venturi, 1¼ inch I. D.

Float Setting: See adjustments.

Vents: Outside, none. Inside, balance vent to air horn above choke valve.

Gasoline Intake: Size No. 46 (.081 inch) drill in needle seat.

Low Speed Jet Tube: Jet, size No. 70 (.028 inch) drill. By-pass in air horn, size No. 55 (.052 inch) drill. Economizer in body, size No. 53 (.0595 inch) drill. Idle bleed in body, size No. 52 (.0635 inch) drill.

Idle Port: Upper port, slot type, length .200 inch; width .030 inch.

Idle Port Opening: Top of port .142 to .146 inch above top edge of valve with valve tightly closed.

Lower Port (For Idle Adjustment Screw): .0615 to .0655 inch diameter.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture turn screw out. Do not idle engine below 550 r.p.m. (Std. and Overdrive trans.); 450 r.p.m. (Hydramatic—in neutral).

Main Nozzle: Nozzle is installed permanently. DO NOT REMOVE. Anti-percolator air bleed, size No. 70 (.028 inch) drill.

Metering Rod: Economy step .078 inch diameter; middle step tapers to 07325 inch diameter; power step .047 inch diameter.

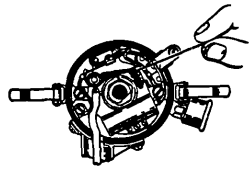
Metering Rod Jet: .102 inch diameter.

Metering Rod Setting: See adjustments.

Accelerating Pump: Diaphragm type, vacuum and mechanically operated. Discharge restriction (in housing), size No. 65 (.035 inch) diameter. Intake ball check seat (in diaphragm housing), size No. 40 (.098 inch) drill. Discharge ball check seat (in diaphragm housing), size No. 32 (.116 inch) drill. Vacuum restriction (in flange), size No. 55 (.052 inch) drill. Vacuum passage (diaphragm bleed), size No. 65 (.035 inch) drill.

Pump Adjustment: None.

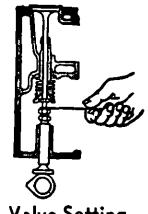
Choke: Carter Climatic® Control, set one point lean, offset butterfly type. Choke heat suction hole in body, size No. 46 (.081 inch) drill.



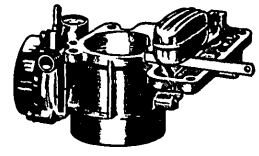
Vacuum Spark Port: Round type, size .040 inch diameter. Bottom of port .021 to .029 inch above top edge of valve with valve tightly closed.

Motor Tune-Up—Be Accurate!

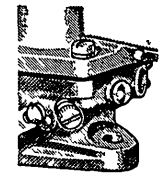
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .030"



Breaker Point Setting .020"



Ignition Timing Breaker Points to Open:

CARBURETER ADJUSTMENTS

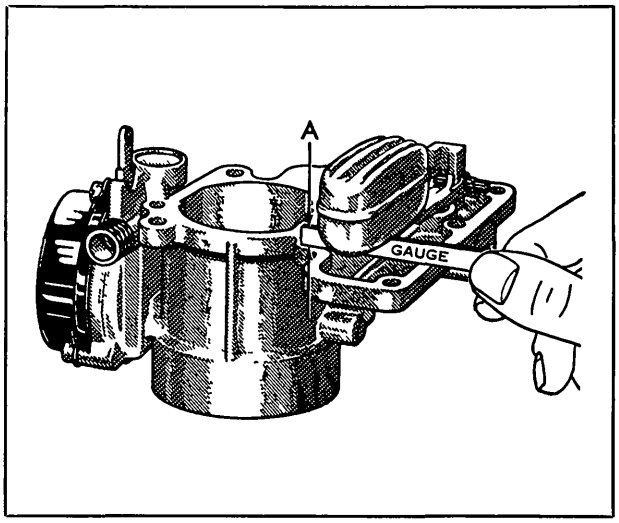

Figure 1
Float Adjustment

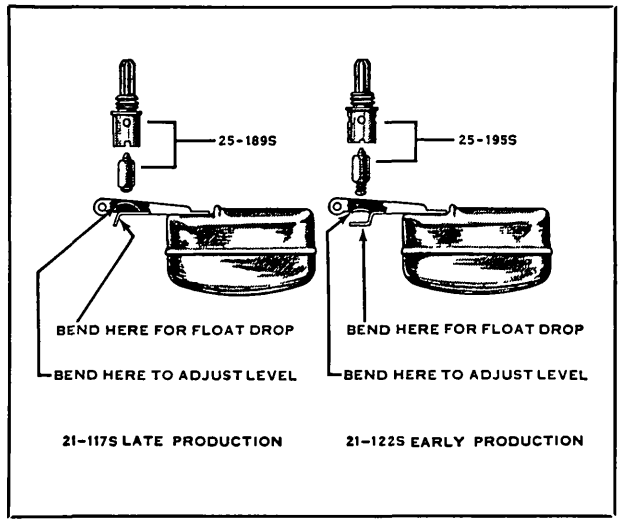

Figure 2
Float and Needle and Seat Assembly

FLOAT ADJUSTMENT (Fig. 1):

With gasket removed, bowl cover assembly inverted, and float resting on seated needle, the distance (A) from the bowl cover to the top of float should be (876S-877S) 5/16 inch (gauge T109-107), (876SA-877SA-2014S) 1/2 inch (gauge T109-83). Adjust by bending lip of float, not float arm

FLOAT AND NEEDLE AND SEAT ASSEMBLY (Fig. 2):

876S and 877S may be brought up to 876SA and 877SA specifications by changing 21-122S float to 21-117S float, and 25-195S needle, seat, spring and pin assembly to 25-189S needle and seat assembly. Then reset float level to 1/2 inch.

When installing 25-189S needle and seat assembly, float and lever assembly 21-117S must be used.

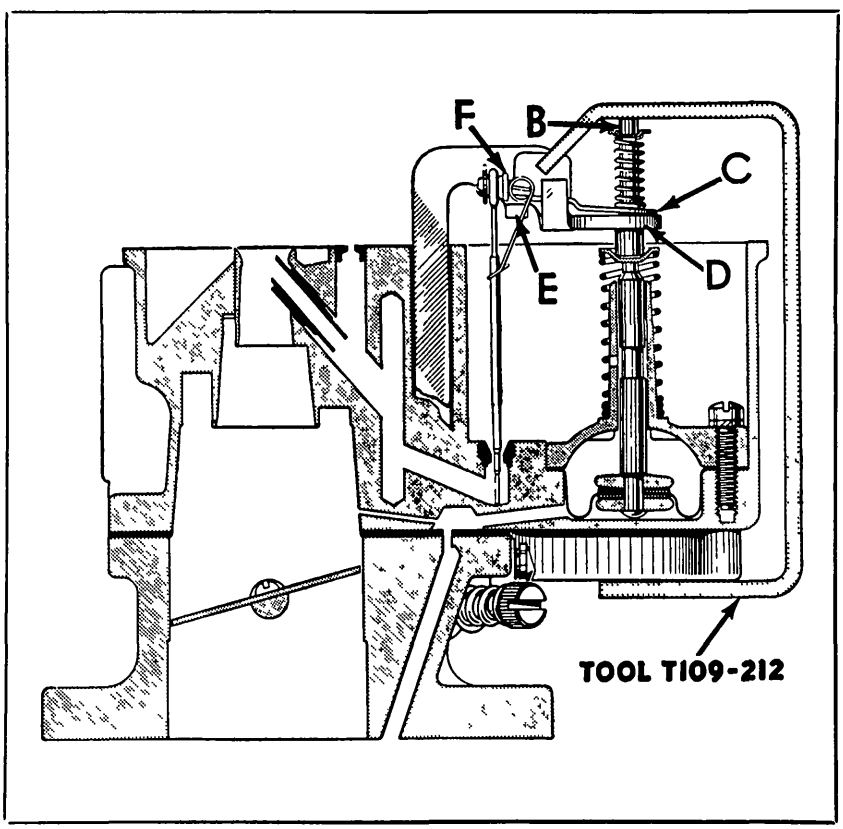

Figure 3
Metering R d Adjustment

METERING ROD ADJUSTMENT (Fig. 3):

This adjustment is important and should be checked each time the carbureter is reassembled or lean rods are installed. With throttle valve seated in bore of carbureter, press down on upper end of diaphragm shaft (B) until diaphragm bottoms in vacuum chamber. (Tool T109-212 may be used to hold diaphragm shaft down while adjusting metering rod.)

Metering rod should contact bottom of metering rod well, and metering rod arm (C) should contact lifter link (D) between springs and at supporting lug (E). Adjust by bending lip (F) up or down

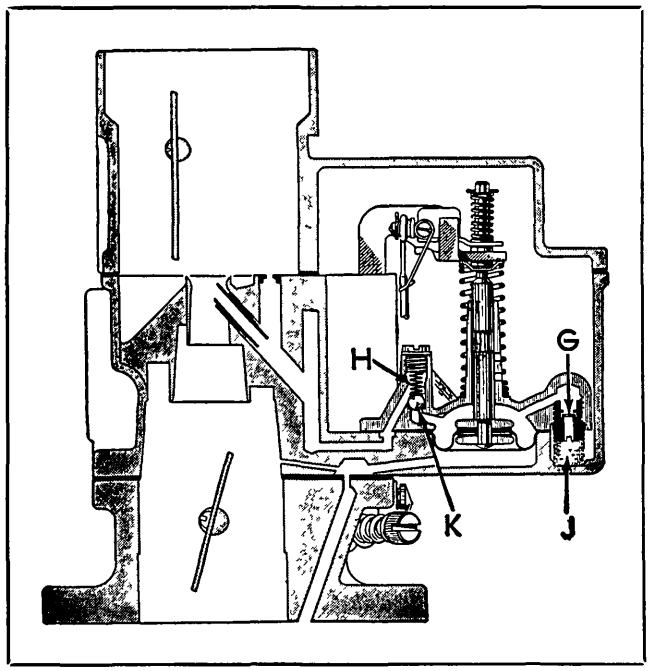

Figure 4
Accelerating Pump

ACCELERATING PUMP (Fig. 4):

If acceleration is not satisfactory, remove pump housing, intake check assembly (G) and discharge check ball (K) and spring (H). Examine diaphragm for wear or damage. Be sure intake screen (J), intake check and discharge check are not clogged with lint or foreign matter. Discharge check ball (K) must seat, as a leak at this point will result in poor acceleration. Inspect and replace all worn parts, clean and blow out all passages with compressed air.

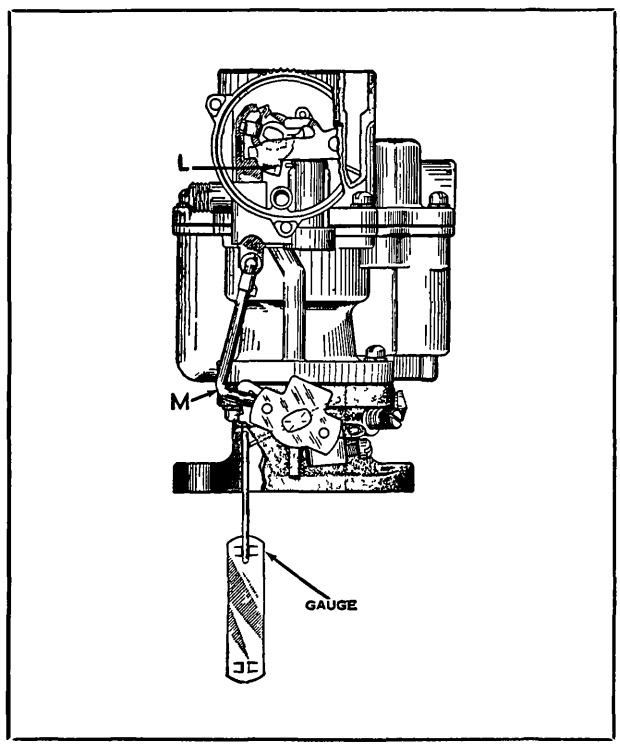

Figure 5
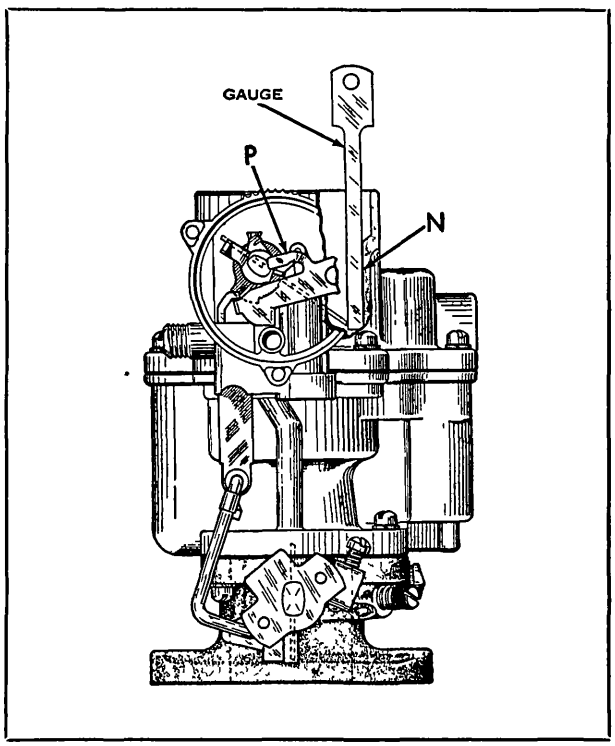
Fast Idle Adjustment



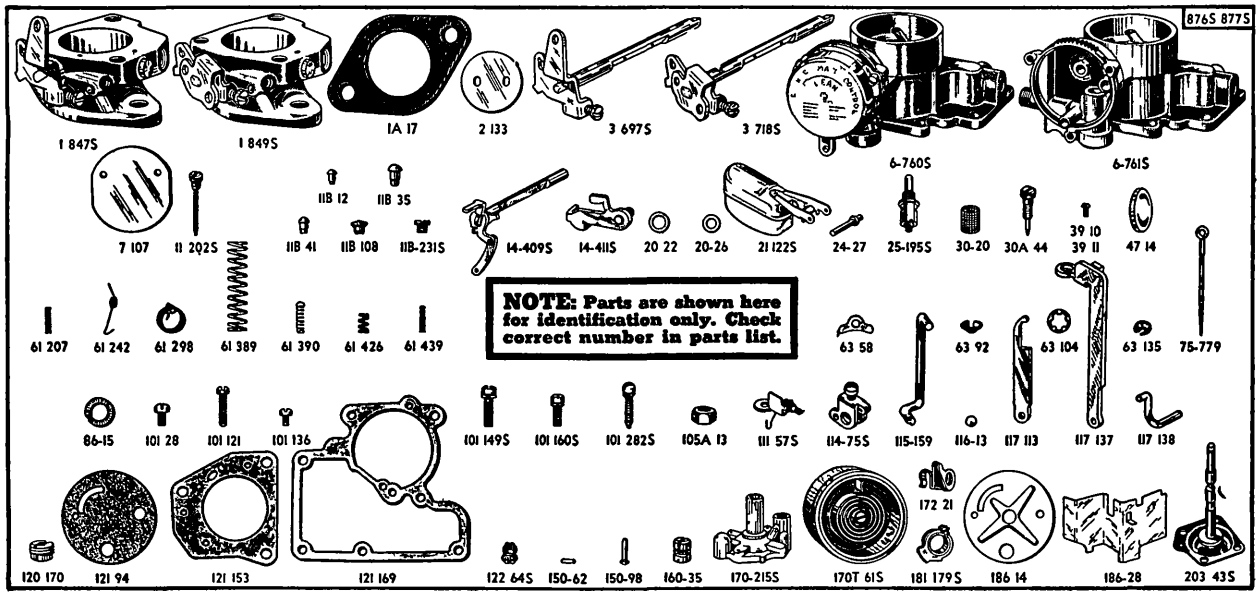


Figure 6
Unloader Adjustment

FAST IDLE ADJUSTMENT (Fig. 5):

Remove thermostatic coil housing, gasket and baffle plate. Crack throttle valve, and hold choke valve fully closed, then close throttle. This will allow fast idle cam to revolve to fast idle position (L). With choke valve held tightly closed and slight tension on throttle lever, there should now be .054 inch clearance (gauge T109-193) between throttle valve and bore of carbureter (side opposite idle port). Adjust by bending connector link at lower angle (M). Use bending tool T109-213.

UNLOADER ADJUSTMENT (Fig. 6):

This adjustment must be made after fast idle adjustment. Hold throttle valve in wide open position and close choke valve as far as possible without forcing. There should be 9/32 inch clearance between lower edge of choke valve and inner wall or air horn (N) (gauge T109-126). Adjust by bending arm of choke trip lever (P) (Us tool T109-214).

Nash 6—1951-1955—Carbureters Nos. 876S-876SA-877S-877SA-2014S

CARBURETER ADJUSTMENTS

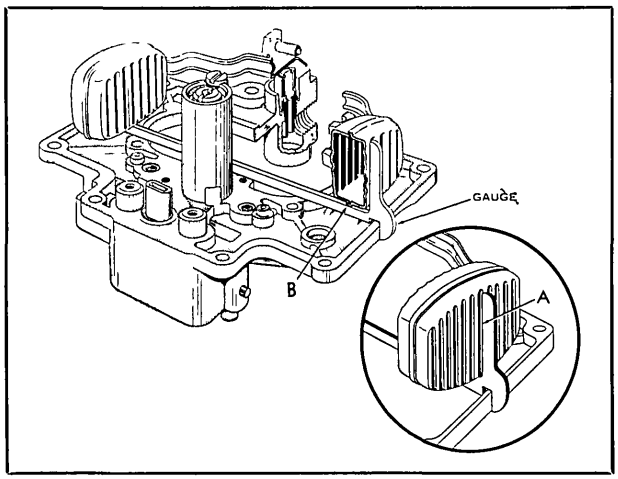

Figure 1
Float Adjustment

FLOAT ADJUSTMENT (Fig. 1):

Two separate float adjustments must be made—lateral and vertical.

LATERAL ADJUSTMENT: With bowl cover assembly inverted, bowl cover gasket removed, place float gauge (T109-196) directly under floats with notched portions of gauge fitted over edges ot casting. Sides of floats should barely touch the vertical uprights of float gauge (A). Adjustment should be made by bending arms of floats.

VERTICAL ADJUSTMENT: With float gauge in same position, floats should just clear the horizontal portion of gauge (Vertical distance (B) between tcp of float and machined surface of casting must be 5/32 inch) Adjust by bending float arms. Remove floats install bowl cover gasket and then reinstall floats.

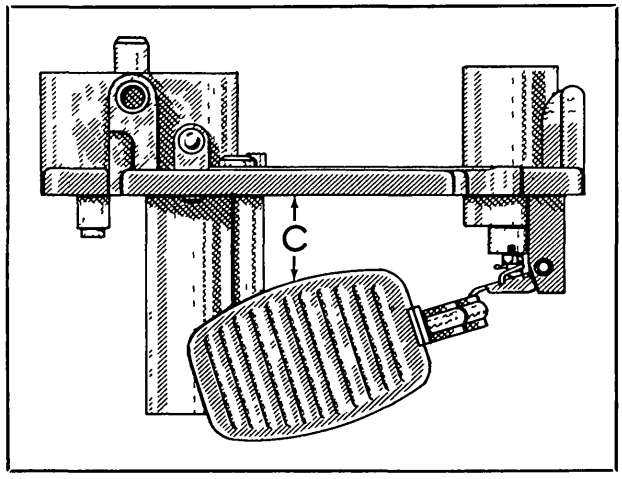

Figure 2
Float Drop Adjustment

FLOAT DROP ADJUSTMENT (Fig. 2):

With bowl cover held in upright position, the distance (C) between top of floats at center and bowl cover should be 5/8 inch. Adjust by bending stop tab on float bracket.

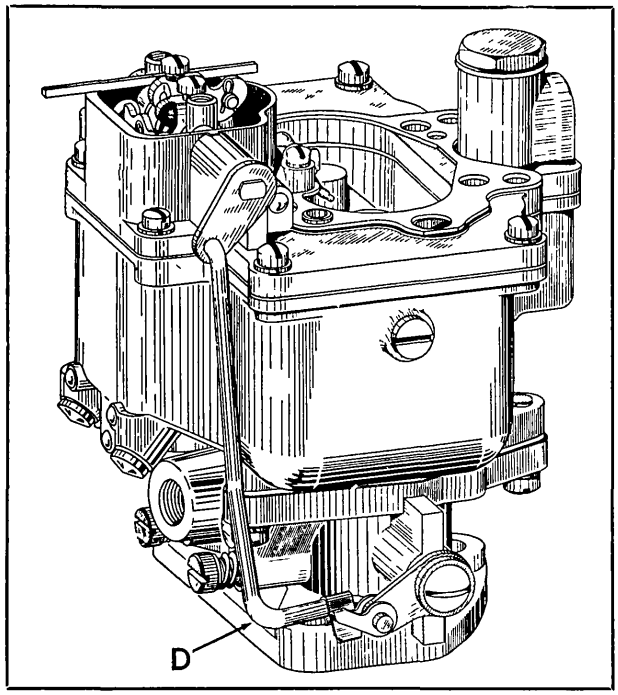

Figure 3
Pump Adjustment

PUMP ADJUSTMENT (Fig. 3):

Back out throttle lever set screw until throttle valves seat in bores of carbureter. Be sure fast idle adjusting screw does not hold throttle open. Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at lower angle (D). Use Tool T109-213.

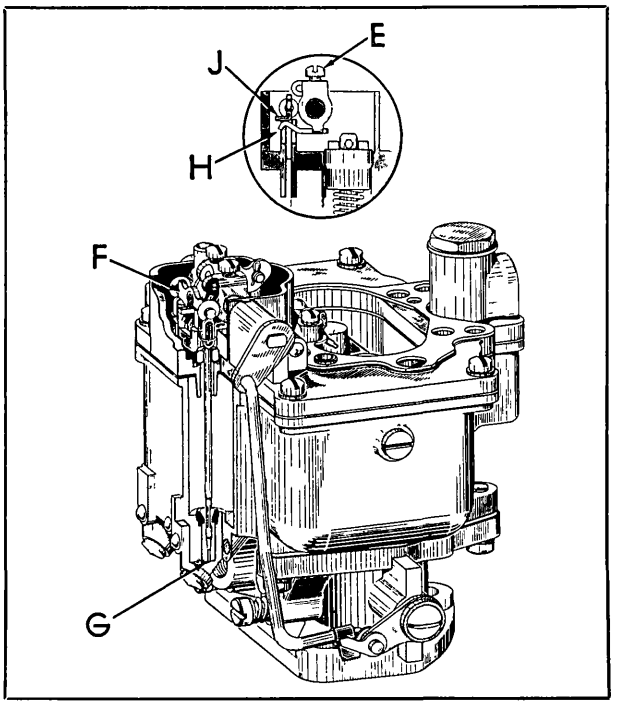

Figure 4
Metering Rod Adjustment

METERING ROD ADJUSTMENT (Fig. 4):

Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows:

1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw (E).
2. With metering rods in place, press down on vacumeter link (F) until metering rods bottom in carbureter body casting (G).
3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger (H) on arm contacts lip (J) of vacumeter link. Hold in place and carefully tighten clamp screw (E).

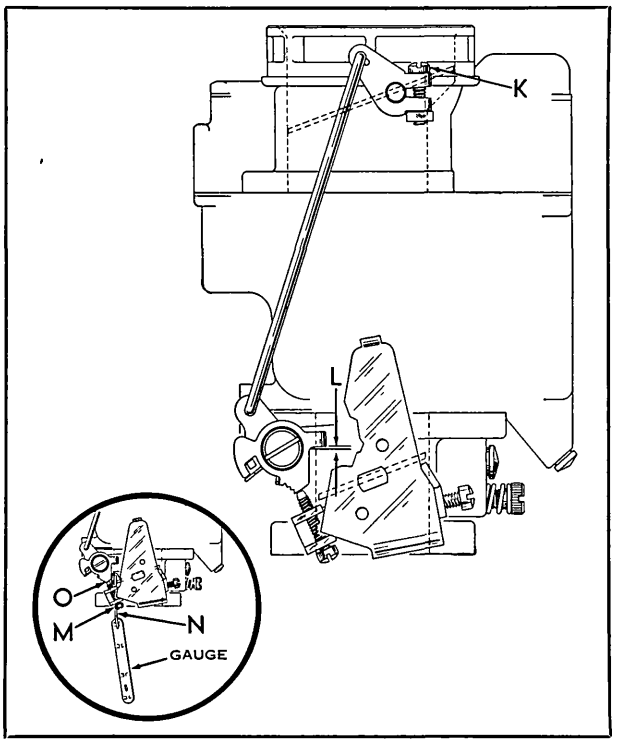

Figure 5
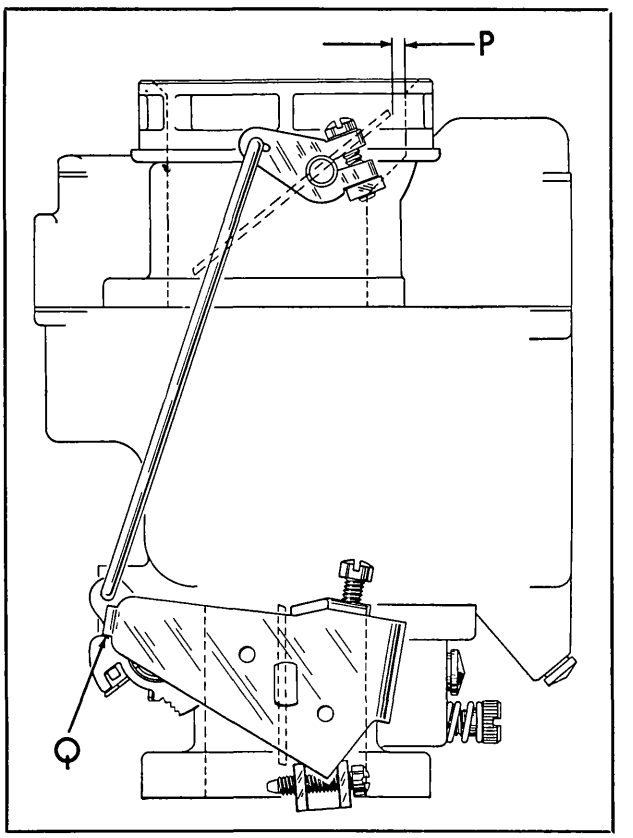
Fast Idle Adjustment

FAST IDLE ADJUSTMENT (Fig. 5):

Loosen choke lever clamp screw (K) on choke shaft. Insert .005 inch feeler gauge T109-237 between lip of fast idle cam and boss of flange casting (L). Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw (K).

With choke valve tightly closed, tighten fast idle adjusting screw (M) until there is .026 inch (gauge T109-189) opening between throttle valve and bore of carbureter (side opposite idle port) (N). Be sure fast idle adjusting screw is on high step of cam (O) while making this adjustment.



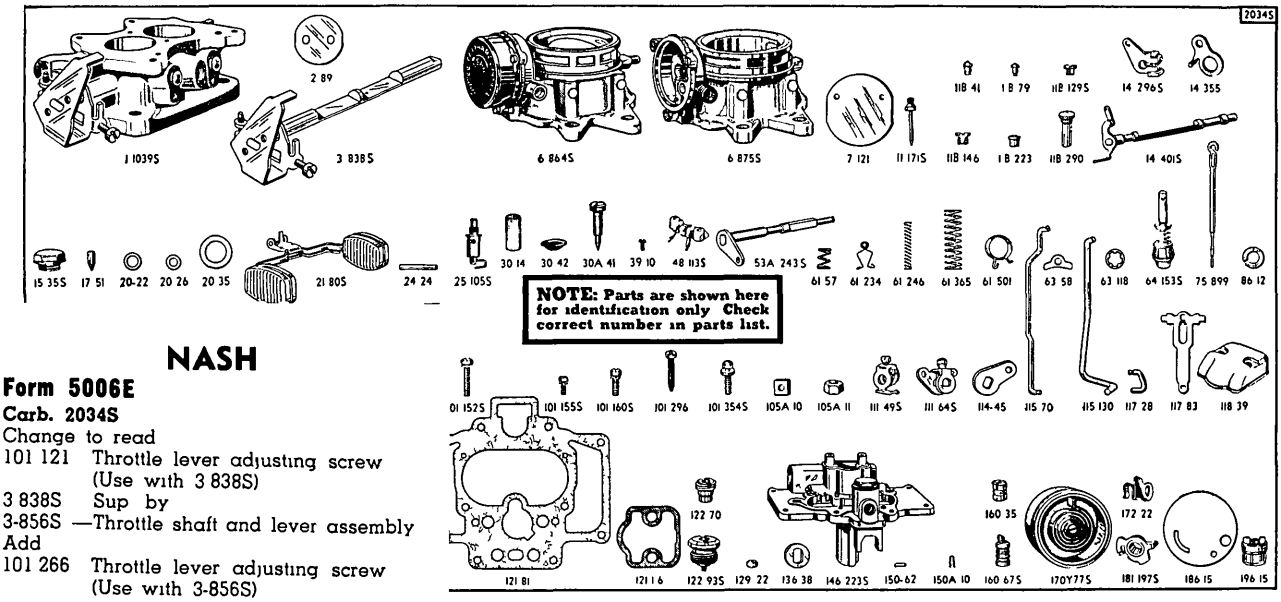


Figure 6
Unloader Adjustment

UNLOADER ADJUSTMENT (Fig. 6):

With throttle wide open there should be 11/64 inch (Gauge T109-166) clearance (P) between upper edge of choke valve and inner wall of air horn. Adjust by bending unloader lip (Q) on throttle shaft lever (Use bending tool T109-41).

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT With bowl cover assembly inverted and float resting on pin in seated needle, and with gasket removed the distance from the bowl cover to the top of float should be 21/64 (gauge T109-107 may be used) Do not depress float lip against spring loaded pin in needle, but let float rest of its own weight Adjust by bending lip of float not float arm Float setting must be checked with bowl cover held at eye height in a level position

METERING ROD ADJUSTMENT This adjustment is important and should be checked each time the carbureter is reassembled or lean rods are installed With throttle valve seated in bore of carbureter press down on upper end of diaphragm shaft until diaphragm bottoms in vacuum chamber (Tool T109-212 may be used to hold diaphragm shaft down while adjusting metering rod) Metering rod should contact bottom of metering rod well and metering rod arm

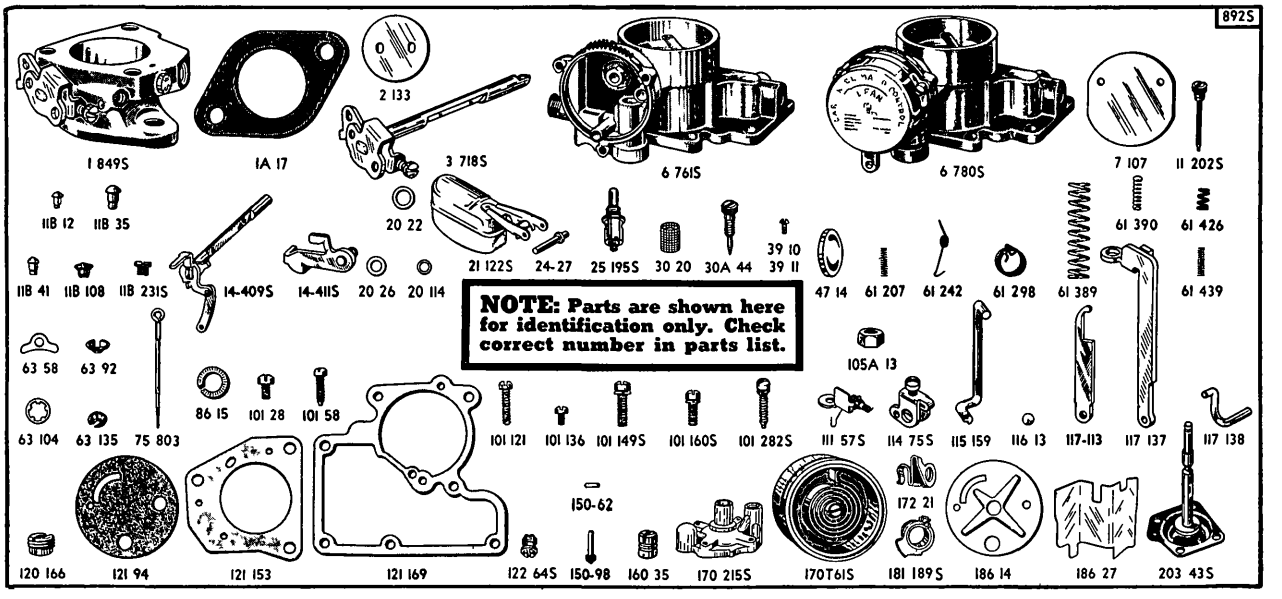
CARBURETER
TRADE MARK REG U S PAT OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.

should contact lifter link between springs and at supporting lug Adjust by bending lip up or down

ACCELERATING PUMP If acceleration is not satisfactory, remove pump housing, intake check assembly and discharge check ball and spring Examine diaphragm for wear or damage Be sure intake screen, intake check and discharge check are not clogged with lint or foreign matter Discharge check ball must seat, as a leak at this point will result in poor acceleration Inspect and replace all worn parts, clean and blow out all passages with compressed air



FAST IDLE ADJUSTMENT Remove thermostatic coil housing, gasket and baffle plate Crack throttle valve and hold choke valve fully closed, then close throttle This will allow fast idle cam to revolve to fast idle position With choke valve held tightly closed and slight tension on throttle lever, there should now be 028 inch clearance between throttle valve and bore of carbureter (side opposite idle port) Adjust by bending connector link at lower angle Use bending tool T109-213

UNLOADER ADJUSTMENT This adjustment must be made after fast idle adjustment Hold throttle valve in wide open position and close choke valve as far as possible without forcing There should be 3/8 inch clearance between lower edge of choke valve and inner wall of air horn (gauge T109-80) Adjust by bending arm of choke trip lever (use tool T109-214)

RECOMMENDED PROCEDURE FOR SETTING IDLE

1 Back out idle speed screw on rear carbureter (fully closed throttle).
2 Adjust idle speed screw on front carbureter to give 550 r p m.
3 Adjust idle mixture on front carbureter to best operation and readjust idle speed if necessary to maintain 550 r p m
4 Back out idle speed screw on front carbureter two full turns (or whatever is necessary to insure closed throttle)
5 Adjust idle speed screw on rear carbureter to give 550 r p m
6 Adjust idle mixture screw on rear carbureter to give best operation and readjust idle speed if necessary
7 Turn in idle speed screw on front carbureter as far as possible without increasing r p m

This should result in balancing the two carbureters Any further adjustment to idle speed or mixture should be made by turning the screws the same amount on each carbureter

YF DOWN-DRAFT CLIMATIC® CONTROL CARBURETERS

Nos. 757S-757SA-757SB-824S-824SA-824SB

CARBURETER SPECIFICATIONS

For Nash (757S SA SB) 6 Cylinder Engine 3⅛ Inch Bore, 3¾ Inch Stroke
For Nash (824S-SA-SB) 6 Cylinder Engine 3⅛ Inch Bore, 4 Inch Stroke

Dimensions Flange size 1¼ inch S A E
Primary venturi 11/32 inch I D
Secondary venturi 11/16 inch I D
Main venturi 1¼ inch I D

Float Setting Distance from float (at free end) to float chamber cover with free weight of float on needle to be ½ inch

Vents Outside none Inside balance vent to air horn above choke valve

Gasoline Intake Square vertical needle Size No 48 drill in needle seat

Low Speed Jet Tube Jet size No 70 (.028 inch) drill By pass in air horn size No 56 drill Bleed in body size No 52 drill Economizer in body size No 56 (.0465 inch) drill

Idle Ports Upper port slot type length .200 inch Width .030 inch

Idle Port Opening Top of port .142 to .146 inch above top edge of valve with valve tight closed Lower port size .053 to .057 inch diameter (For idle adjusting screw)

Set Idle Adjustment Screw 1 to 2 turns open For richer mixture turn screw out Do not idle engine below 500 r p m (824S SA SB) For hydramatic do not idle engine below 375 r p m

Main Nozzle In primary venturi angle 40° off vertical Nozzle is installed permanently **Do not remove**
Anti Percolator Air Bleed size .035 inch diameter

Metering Rod (Diaphragm Type) Economy step .0725 inch diameter middle step tapers to .068 inch diameter power step .040 inch diameter
(This rod is designed with flats on economy step)

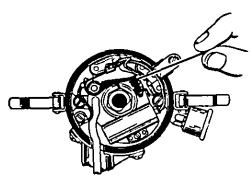
Metering Rod Jet (757S SA 824S SA) .098 inch diameter (757SB 824SB) .096 inch diameter

Metering Rod Setting See Adjustments

Accelerating Pump Diaphragm type vacuum operated
Discharge through nozzle
Intake (disk check) size No 40 (.098 inch) drill
Vacuum restriction (in flange) size No 55 drill
Vacuum passage (diaphragm bleed) size No 65 drill
Discharge (ball check) seat size No 32 drill in diaphragm housing

Pump Adjustment None

Choke Carter Climatic® Control set on index Valve Offset butterfly type Choke heat suction hole restriction in body size No 46 drill



Vacuum Spark Port Slot type Size .125 by .041 inch Bottom of port .025 .035 inch above top edge of valve in closed position

NASH STATESMAN SIX MODELS 5040-5140 1950-51

RAMBLER SIX MODEL 5110 1951

WA-1 Down-Draft **Carbureter 780S** With Climatic® Control

CARBURETER SPECIFICATIONS

For Nash 6 Cylinder Engine: 3⅛" Bore, 3¾" Stroke
For Nash 6 Cylinder Engine: 3⅛" Bore, 4" Stroke

Dimensions: Flange size, 1¼ inch S. A. E.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 11/16 inch I. D.
Main venturi, 1¼ inch I. D.

Float Level: Distance from seam of float (at free end) to tip on lower edge of float chamber cover to be ½ inch when needle is seated. (See cut.)

Outside Vent: No. 10 drill size. No inside vent.

Gasoline Intake: Square vertical needle. No. 48 drill size in needle seat.

Low Speed Jet Tube: Jet No. 69 drill size.
By-pass in body, 53 drill size.
Economizer in body, .0755-.0765 inch diameter.
Idle bleed, No. 50 drill size.

Idle Port: Slot type, length, .200 inch, width .032 inch.

Idle Port Opening: Top of port .153 to .157 inch above top edge of valve with valve tight closed.

Idle Screw Seat: No. 46 drill.

Set Idle Adjustment Screw: ¾ to 1¾ turns open. For richer mixture, turn screw out. Do not attempt to idle engine below 500 r.p.m. or 7 m.p.h.

Main Nozzle: In primary venturi, angle 45°. Angled tip.
Inside diameter, No. 30 drill.
Discharge jet size, .0885 inch diameter.

Metering Rod: Economy step, .078 inch diameter. Middle step tapers to .072 inch diameter. Power step, .044 inch diameter. Length of rod, 3-9/64 inches.

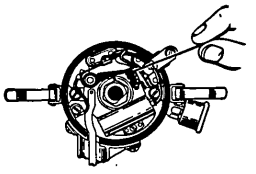
Metering Rod Jet: .103 inch diameter.

Metering Rod Setting: Use gauge, part No. T109-102 (2.468 inches).

Accelerating Pump: Pressure type, spring operated lever, with adjustable stroke.
Discharge through nozzle.
Intake ball check, seat size, No. 40 drill in body.
Discharge ball check, seat size, No. 32 drill in body.

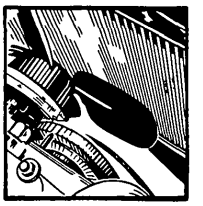
Pump Adjustment: 25/64 inch plunger travel. Top hole, (long stroke.) (Full throttle position.) Use gauge T109-117S.

Choke: Carter Climatic® Control, set at index.
Butterfly type, offset valve. Choke heat suction hole, in body. Size No. 38 (.1015 inch) drill.

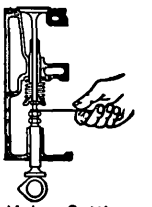


Vacuum Spark Port: .039 to .041 inch diameter. Bottom of port .021 to .029 inch above valve.

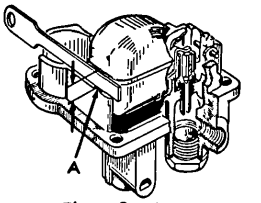
Motor Tune-Up—Be Accurate!



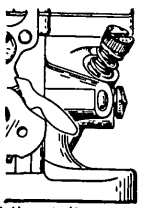
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .030"



Breaker Point Setting .020"



Ignition Timing Breaker Points to Open: T.D.C.

Valve Setting (Hot) Intake .015" Exhaust .015"

Float Setting ½ Inch (Measure from point "A" to top of float seam)

Idle Adjustment Screw Setting ¾ to 1¾ Turns Open

CARBURETER ADJUSTMENTS

Pump Circuit: The pump circuit differs from previous models, as no pump jet is used. The pump discharges through the nozzle into the primary venturi. A spring loaded ball acts as a discharge check and prevents any fuel from entering the nozzle well from the pump cylinder after the pump stroke is completed.

Pump Adjustment: With throttle valve seated and connector link in upper hole of pump arm, pump plunger should travel 25/64" from seated to wide open position. Pump travel can be measured by using universal pump stroke gauge T109-117S, placing base of gauge on ridged portion of bowl cover so that indicator ear of pump gauge rests on top surface of connector link where it extends through plunger shaft. Hold gauge vertical. The difference between the number shown by index mark on gauge, at wide open and closed positions, should be "25". Link position may be changed to accommodate climatic conditions after adjustment has been made.

CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.

Adjustment should be made by bending throttle connector rod at lower angle

Metering Rod Adjustment Correct setting of metering rod is important and must be made after pump adjustment Procedure is as follows

(1) Back out throttle lever set screw to seat throttle valve

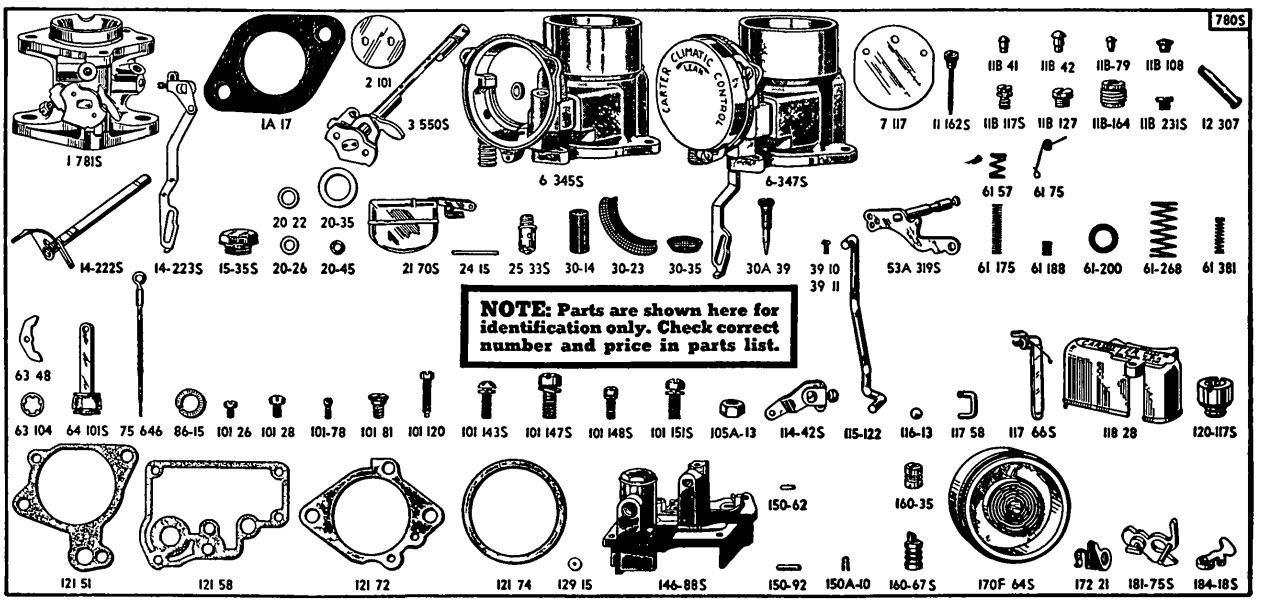
(2) Insert metering rod gauge T109-102 in place of metering rod, seating tapered end in metering rod jet

(3) Press lightly on vacuum piston link until lip contacts pin on pump operating lever There should be less than 005 between metering rod pin and shoulder pin in notch of gauge

(4) Adjustment can be made by bending lip of vacuum piston link

Remove gauge and install metering rod and disk Connect metering rod spring

Anti-Percolator Adjustment Crack throttle valve 030" by placing gauge T109-29 between valve and bore of carbureter (side opposite port) Bend rocker arm (Use tool T109-105) until there is a clearance of 005" to 015" between rocker arm and pump arm



Fast Idle Adjustment With fast idle cam held in normal idle position, tighten throttle lever adjusting screw until it just touches cam Hold throttle closed and pull cam back until first (or lower) step on cam is against (not on) set screw

There should now be 5/8' clearance between inside wall of air horn and lower edge of choke valve (Use tool T109-85)

Adjustment can be made by bending at offset portion of fast idle link (Use tool T109-41)

Unloader Adjustment With throttle valve wide open there should be 7/16 clearance between lower edge of choke valve and inner wall of air horn (Use tool T109-81) Adjustment should be made by bending arm on throttle lever using tool T109-41

Lock Out Adjustment With throttle and choke valve wide open choke should lock in wide open position Adjustment should be made by bending lip at lower end of fast idle link to give 1/32 clearance between lip and throttle lever lock **Lock-out adjustment cannot be made when the choke lever, screw and link assembly without the lock-out lip is installed**

NASH AMBASSADOR SIX MODELS "5060"-"5160" 1950-1951

WA-1 Down-Draft **Carbureter 746S** With Climatic® Control

CARBURETER SPECIFICATIONS

For Nash 6 Cylinder Engine, 3⅜" Bore, 4⅜" Stroke

Dimensions: Flange size, 1¼ inch S. A. E.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 11/16 inch I. D.
Main venturi, 1-5/16 inch I. D.

Float Level: Distance from seam of float (at free end) to tip on lower edge of float chamber cover to be ½ inch when needle is seated. (See cut.)

Outside Vent: No. 10 drill size (2 holes). No inside vent.

Gasoline Intake: Square vertical needle. No. 46 drill size in needle seat.

Low Speed Jet Tube: Jet No. 64 drill size.
By-pass in body, 53 drill size.
Economizer in body, .063-.064 inch diameter.
Idle bleed, No. 50 drill size.

Idle Port: Length, .175 inch. Width, .030 inch.

Idle Port Opening: .137 to .141 inch above upper edge of valve with valve closed tight.

Idle Screw Seat: No. 46 drill.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture, turn screw out. Do not attempt to idle engine below 350 r.p.m. or 7 m.p.h.

Main Nozzle: In primary venturi, angle 45°. Closed tip. Top hole (.021 inch) diameter on 45° angle. Lower hole (.081 inch) diameter on 70° angle.

Metering Rod: Standard: Economy step, .076 inch diameter. Middle step tapers to .066 inch diameter.
Power step, .040 inch diameter. Length of rod, 3-9/64 inches.

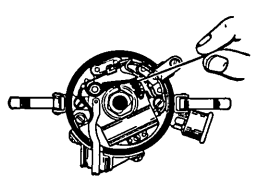
Metering Rod Jet: .0995 inch diameter.

Metering Rod Setting: Use gauge, part No. T109-102 (2.468 inches).

Accelerating Pump: Pressure type, with adjustable stroke. Discharge through nozzle.
Intake ball check seat size, No. 40 drill in body.
Discharge ball check, seat size, No. 32 drill in body.

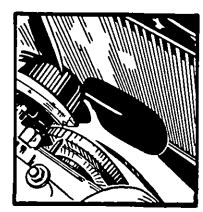
Pump Adjustment: 27/64 inch plunger travel (long stroke), full throttle position. Use gauge T109-117S.

Choke: Carter Climatic® Control, set at index. Butterfly type, offset valve. Choke heat suction hole, in body. Size No. 37 (.104 inch) drill.

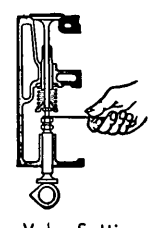


Vacuum Spark Port: .061-.064 inch diameter. Bottom of port .020 to .030 inch above valve.

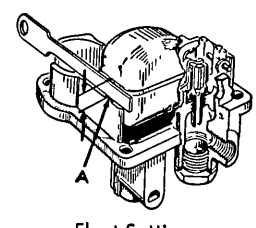
Motor Tune-Up—Be Accurate!



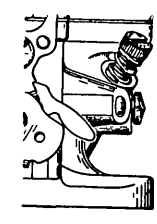
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .030"



Breaker Point Setting .020"



Ignition Timing Breaker Points to Open: T. D. C.

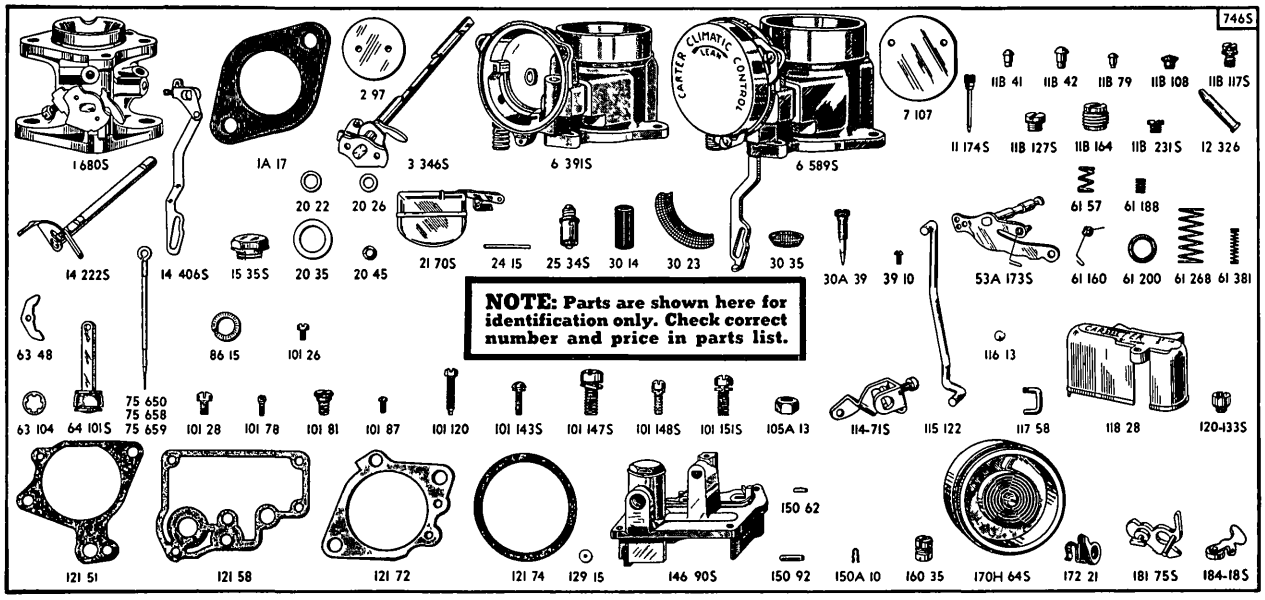
Valve Setting (Hot) Intake .015" Exhaust .018"

Float Setting ½ Inch (Measure from point "A" to top of float seam)

Idle Adjustment Screw Setting ½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

Pump Circuit: The pump circuit differs from previous models, as no pump jet is used. The pump discharges through the nozzle into the primary venturi. A spring loaded ball acts as a discharge check and prevents any fuel from entering the nozzle well from the pump cylinder after the pump stroke is completed.



Pump Adjustment: With throttle valve seated and connector link in upper hole in pump arm, pump plunger should travel 27/64" from closed to wide open position. Pump travel should be measured by placing universal pump travel gauge T109-117S on ridged portion of bowl cover so that indicator ear of pump gauge rests on top surface of connector link at pump

CARBURETER ADJUSTMENTS

Pump Circuit The pump circuit differs from previous models, as no pump jet is used The pump discharges through the nozzle into the primary venturi A spring loaded ball acts as a discharge check and prevents any fuel from entering the nozzle well from the pump cylinder after the pump stroke is completed

Pump Adjustment With throttle valve seated and connector link in upper hole of pump arm pump plunger should travel 25/64' from seated to wide open position Pump travel can be measured by using universal pump stroke gauge T109-117S, placing base of gauge on ridged portion of bowl cover so that indicator ear of pump gauge rests on top surface of connector link where it extends through plunger shaft Hold gauge vertical The difference between the number shown by index mark on gauge at wide open and closed positions should be "25' Link position may be changed to accommodate climatic conditions after adjustment has been made

Adjustment should be made by bending throttle connector rod at lower angle

Metering Rod Adjustment Correct setting of metering rod is important and must be made after pump adjustment Procedure is as follows

(1) Back out throttle lever set screw to seat throttle valve

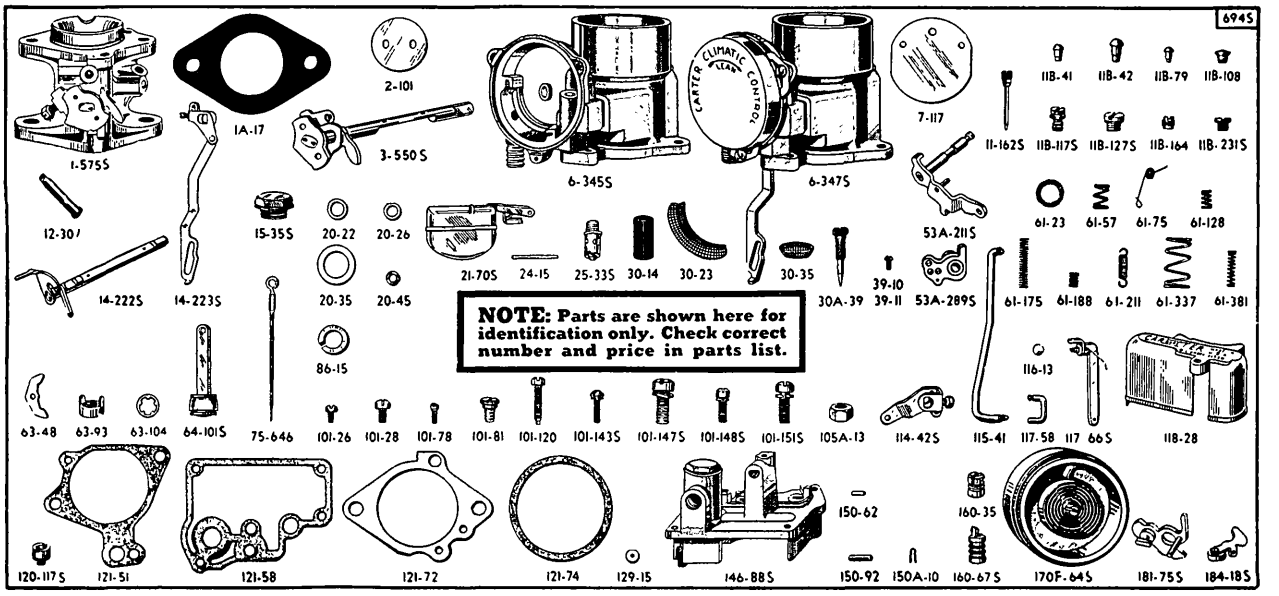
Copyright © 1948
Copyright © 1952
by Carter Carburetor Corporation
All Rights Reserved

CARBURETER
TRADE MARK REG U S PAT OFF.
MARCA REGISTRADA

PRINTED IN U S A

(2) Insert metering rod gauge T109-102 in place of metering rod, seating tapered end in metering rod jet.
(3) Press lightly on vacuum piston link until lip contacts pin on pump operating lever. There should be less than .005" between metering rod pin and shoulder pin in notch of gauge.
(4) Adjustment can be made by bending lip of vacuum piston link.

Remove gauge and install metering rod and disk. Connect metering rod spring.



Anti-Percolator Adjustment: Crack throttle valve .030" by placing gauge T109-29 between valve and bore of carbureter (side opposite port). Bend rocker arm (Use tool T109-105) until there is a clearance of .005" to .015" between rocker arm and pump arm.

Fast Idle Adjustment: With fast idle cam held in normal idle position, tighten throttle lever adjusting screw until it just touches cam. Hold throttle closed and pull cam back until first (or lower) step on cam is against (not on) set screw.

There should now be 5/8" clearance between inside wall of air horn and lower edge of choke valve. (Use tool T109-85.) Adjustment can be made by bending at offset portion of fast idle link. (Use tool T109-41.)

Unloader Adjustment: With throttle valve wide open there should be 7/16" clearance between lower edge of choke valve and inner wall of air horn. (Use tool T109-81.) Adjustment should be made by bending arm on throttle lever using tool T109-41.

Lock-Out Adjustment: With throttle and choke valve wide open, choke should lock in wide open position. Adjustment should be made by bending lip at lower end of fast idle link to give 1/32" clearance between lip and throttle lever lock.

WA-1 Down-Draft **Carbureter 683S** With Climatic® Control

CARBURETER SPECIFICATIONS

For Nash 683S 6 Cylinder Engine, 3⅜" Bore, 4⅜" Stroke

Dimensions: Flange size, 1¼ inch S. A. E.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 11/16 inch I. D.
Main venturi, 1-5/16 inch I. D.

Float Level: Distance from seam of float (at free end) to tip on lower edge of float chamber cover to be ½ inch when needle is seated. (See cut.)

Outside Vent: No. 10 drill size (2 holes). No inside vent.

Gasoline Intake: Square vertical needle. No. 46 drill size in needle seat.

Low Speed Jet Tube: Jet No. 64 drill size
By-pass in body, 53 drill size.
Economizer in body, .063-.064 inch diameter.
Idle bleed, No. 50 drill size.

Idle Port: Length, .175 inch. Width, .030 inch.

Idle Port Opening: .137 to .141 inch above upper edge of valve with valve closed tight.

Idle Screw Seat: No. 46 drill.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture, turn screw out. Do not attempt to idle engine below 350 r.p.m. or 7 m.p.h.

Main Nozzle: In primary venturi, angle 45°. Closed tip. Top hole (.021 inch) diameter on 45° angle. Lower hole (.081 inch) diameter on 70° angle.

Metering Rod: Standard: Economy step, .076 inch diameter. Middle step tapers to .066 inch diameter.
Power step, .040 inch diameter. Length of rod, 3-9/64 inches.

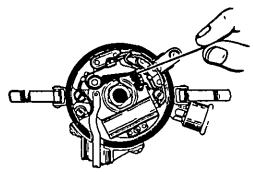
Metering Rod Jet: .0995 inch diameter.

Metering Rod Setting: Use gauge, part No. T109-102 (2.468 inches).

Accelerating Pump: Pressure type, with adjustable stroke. Discharge through nozzle.
Intake ball check seat size, No. 40 drill in body.
Discharge ball check, seat size, No. 32 drill in body.

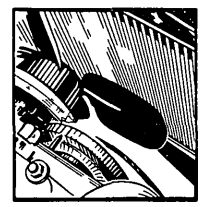
Pump Adjustment: 27/64 inch plunger travel (long stroke), full throttle position. Use gauge T109-117S.

Choke: Carter Climatic® Control, set at index. Butterfly type, offset valve. Choke heat suction hole, in body. Size No. 33 (.113 inch) drill.



Vacuum Spark Port: .061-.064 inch diameter. Bottom of port .020 to .030 inch above valve.

Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

Pump Circuit: The pump circuit differs from previous models, as no pump jet is used. The pump discharges through the nozzle into the primary venturi. A spring loaded ball acts as a discharge check and prevents any fuel from entering the nozzle well from the pump cylinder after the pump stroke is completed.

Pump Adjustment: With throttle valve seated and connector link in upper hole in pump arm, pump plunger should travel 27/64" from closed to wide open position. Pump travel should be measured by placing universal pump travel gauge T109-117S on ridged portion of bowl cover so that indicator ear of pump gauge rests on top surface of connector link at pump shaft. Hold gauge vertical. The difference between numbers shown by index mark on gauge, at wide open and closed position, should be 27.

Adjust by bending throttle connector rod at lower angle.

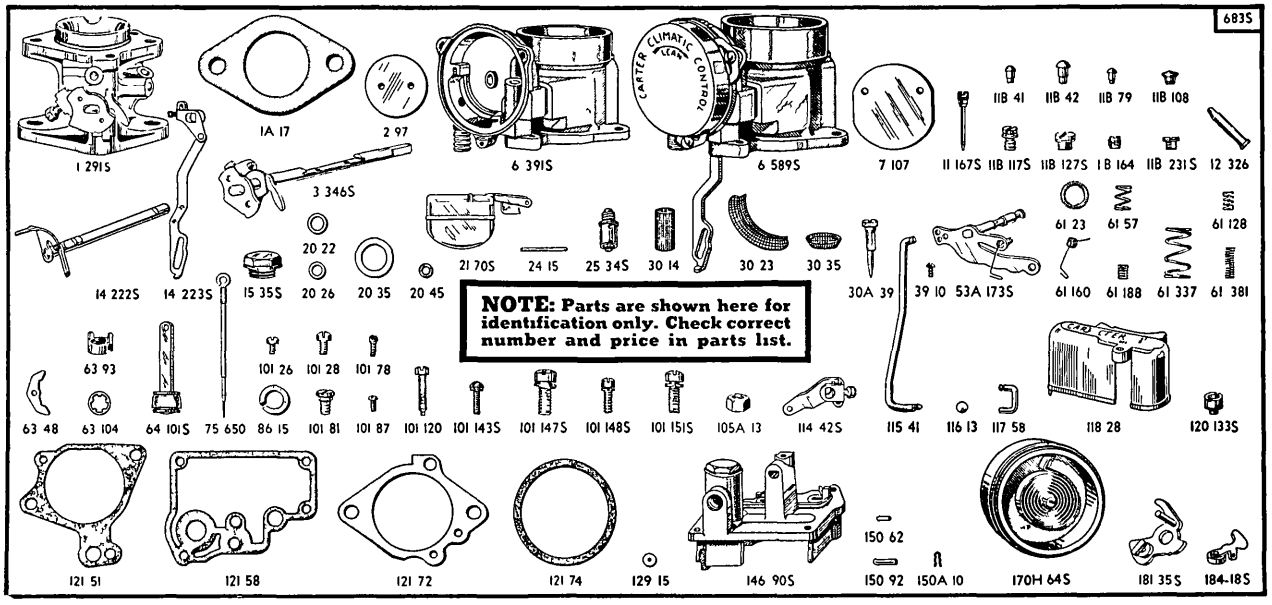
CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.

Metering Rod Adjustment Correct setting of metering rod is important and must be made after pump adjustment Insert gauge T109-102 in place of metering rod seating tapered end in metering rod jet Hold gauge vertical to insure seating With throttle valve seated there should be less than .005" clearance between pin in pump arm and shoulder in notch of gauge

Adjustment should be made by bending metering rod arm pin portion of pump arm up or down

Remove gauge, and install metering rod and disk Connect metering rod spring



Anti Percolator Adjustment Crack throttle valve .020" by placing gauge T109-29 between throttle valve and bore of carbureter (side opposite port) Bend rocker arm (bending tool T109-105) until there is a clearance of .005" to .015" between rocker arm and pump arm

Fast Idle Adjustment With fast idle cam held in normal idle position, tighten throttle lever adjusting screw until it just seats against cam Hold throttle lever closed and pull cam back until first (or lower) step on cam is against (not on) set screw

There should now be 5/8 clearance between inside wall of air horn and lower edge of choke valve (Use tool T109-85) Adjustment can be made by bending at offset portion of fast idle link (Use tool T109-41)

Unloader Adjustment. With throttle valve wide open there should be 31/64" clearance between lower edge of choke valve and inner wall of air horn (Use tool T109-82) Adjustment should be made by bending cam on throttle lever (Use tool T109-41)

Lock-Out Adjustment With throttle and choke valve wide open choke should lock in wide open position Adjustment should be made by bending lip at lower end of fast idle link to give 1/32" clearance between lip and throttle lever lock, with throttle and choke valve held wide open (Use tool T109-105) Lock-out adjustment cannot be made when the choke lever, screw and link assembly without the lock-out lip is installed

Nash 6—1949—Carbureter No. 683S

WHEN SERVICING, USE GASKET ASSORTMENT No 139A; REPAIR PACKAGE No. 1399A

NASH SIX MODEL "4840" 1948

(780S can also be used)

WA-1 Down-Draft **Carbureters 662S-662SA** With Climatic® Control

CARBURETER SPECIFICATIONS

For Nash 6 Cylinder Engine 3 1/8" Bore, 3 3/4" Stroke

Dimensions Flange size 1 1/4 inch S A E
Primary venturi 11/32 inch I D
Secondary venturi 11/16 inch I D
Main venturi 1 1/4 inch I D

Float Level: Distance from seam of float (at free end) to tip on lower edge of float chamber cover to be 1/2 inch when needle is seated (See cut)

Outside Vent No 10 drill size No inside vent

Gasoline Intake Square vertical needle No 48 drill size in needle seat

Low Speed Jet Tube (662S) Jet No 68 drill size (662SA) No 67 drill size
By pass in body 53 drill size
Economizer in body 0755 0765 inch diameter
Idle bleed No 50 drill size

Idle Port: Slot type, length, 200 inch width 032 inch

Idle Port Opening: Top of port 153 to 157 inch above top edge of valve with valve tight closed

Idle Screw Seat: No 46 drill

Set Idle Adjustment Screw 3/4 to 1 3/4 turns open For richer mixture, turn screw out Do not attempt to idle engine below 350 r p m or 7 m p h

Main Nozzle. In primary venturi angle 45° Angled tip
Inside diameter No 30 drill
Discharge jet size 086 inch diameter

Metering Rod Economy step 077 inch diameter Middle step tapers to 070 inch diameter Power step 040 inch diameter
Length of rod 3 9/64 inches

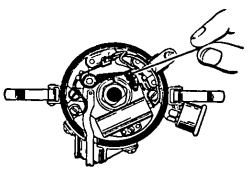
Metering Rod Jet: 103 inch diameter

Metering Rod Setting: Use gauge part No T109-102 (2 468 inches)

Accelerating Pump· High pressure type spring operated lever with adjustable stroke
Discharge jet (No 72 drill) 025 inch diameter
Intake ball check seat size No 40 drill in body
Discharge ball check seat size No 32 drill in body
Relief passage to outside No 42 drill size

Pump Adjustment· 25/64 inch plunger travel Top hole (long stroke) (Full throttle position) Use gauge T109 117S

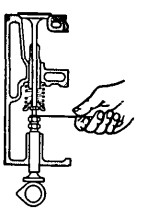
Choke· Carter Climatic® Control (662S) set 2 points lean (662SA) set on index Butterfly type offset valve Choke heat suction hole in body size No 42 drill (early production) No 38 drill (later production)



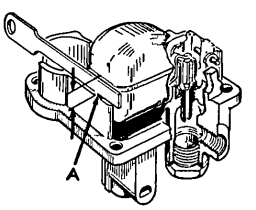
Vacuum Spark Port· 039 to 041 inch diameter Bottom of port 021 to 029 inch above valve

Motor Tune-Up—Be Accurate!

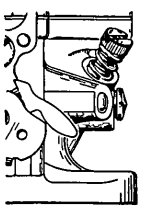
CAUTION Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter



Spark Plug Gap 025"



Breaker Point Setting .020"



Ignition Timing Breaker Points to Open: T. D C.

Valve Setting Int 015" Exh. .015"

Float Setting 1/2 inch (Measure from point "A" to top of float seam)

Idle Adjustment Screw Setting 3/4 to 1 3/4 Turns Open

CARBURETER ADJUSTMENTS

Pump Adjustment: With pump connector link in outer hole of pump arm, and throttle adjustment screw backed out until throttle valve seats in bore of carbureter, pump travel should be 25/64" from seated to wide open position Pump travel can be measured by using universal pump stroke gauge T109-117S, by placing gauge on ridged portion of bowl cover. Hold gauge vertical Adjust gauge until indicator ear contacts top surface of connector link where it extends through plunger shaft Repeat at wide open throttle The difference between the number shown by index mark on gauge, at wide open and closed positions, should be "25' Adjustment should be made by bending throttle connector rod at lower angle Link position may be changed to accommodate climatic or seasonal conditions after adjustment has been made

Metering Rod Adjustment: Correct setting of metering rod is important and must be made after pump adjustment Procedure is as follows

(1) Back out throttle lever set screw until throttle valve seats

(2) Insert metering rod gauge T109-102 in place of metering rod, seating tapered end in metering rod jet

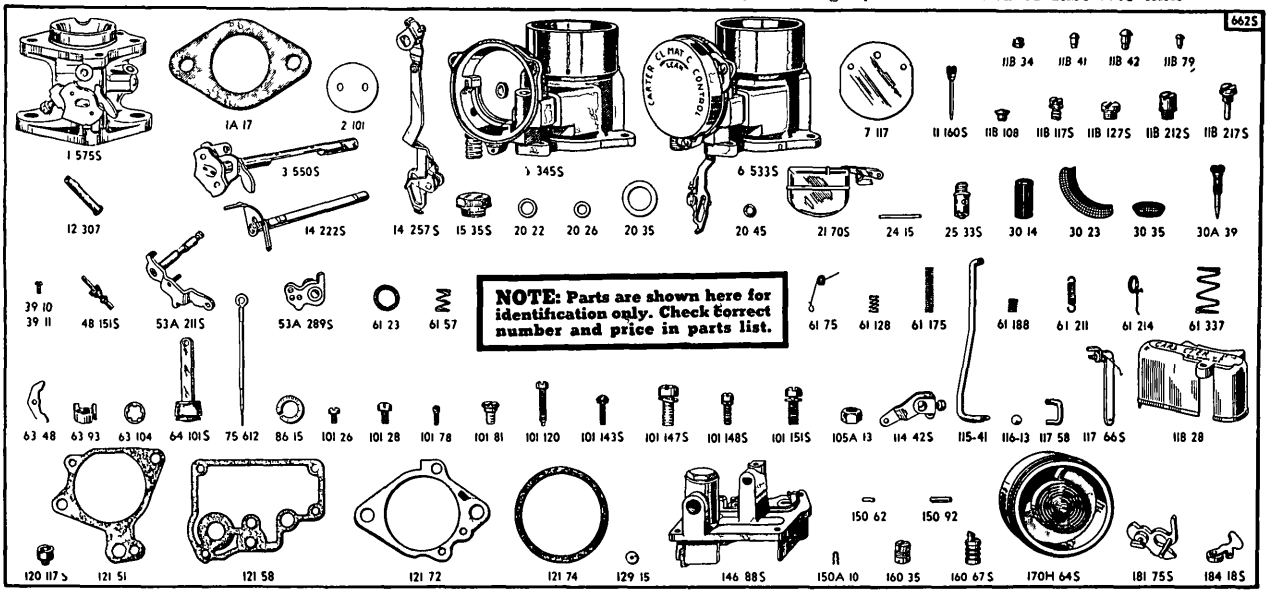
CARBURETER
TRADE MARK REG U S PAT. OFF.
MARCA REGISTRADA

PRINTED IN U S A

(3) Press lightly on vacuum piston link until lip contacts pin on pump operating lever There should be less than 005 between metering rod pin and shoulder in notch of gauge

(4) Adjust by bending lip on vacuum piston link Remove gauge and install metering rod and disk Connect metering rod spring



Anti-Percolator Adjustment. Crack throttle valve 030" by placing gauge T109-29 between valve and bore of carbureter (side opposite port) Bend rocker arm (Use tool T109-105) until there is a clearance of 005" to 015" between rocker arm and pump arm

Fast Idle Adjustment: With fast idle cam held in normal idle position, tighten throttle lever adjusting screw until it just touches cam Hold throttle closed and pull cam back until first (or lower) step on cam is against (not on) set screw

There should now be 5/8" clearance between inside wall of air horn and lower edge of choke valve (Use tool T109-85) Adjustment can be made by bending at offset portion of fast idle link (Use tool T109-41)

Unloader Adjustment: With throttle valve wide open there should be 7/16" clearance between lower edge of choke valve and inner wall of air horn (Use gauge T109-81) Adjustment should be made by bending arm on throttle lever with tool T109-41

Lock-Out Adjustment: With throttle and choke valves wide open, choke should lock in wide open position With throttle held wide open, push choke valve to wide open position Choke should lock wide open Adjustment should be made by bending lip at lower end of fast idle link

WA-1 Down-Draft **Carbureter 464S** With Climatic® Control

CARBURETER SPECIFICATIONS

For Nash 464S—6 Cylinder Engine, 3⅜" Bore, 4⅜" Stroke

Dimensions: Flange size, 1¼ inch S. A. E.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 11/16 inch I. D.
Main venturi, 1-5/16 inch I. D.

Float Level: Distance from seam of float (at free end) to tip on lower edge of float chamber cover to be ⅜ inch when needle is seated. (See cut.)

Outside Vent: No. 10 drill size (2 holes). No inside vent.

Gasoline Intake: Square vertical needle. No. 46 drill size in needle seat.

Low Speed Jet Tube: Jet No. 65 drill size.
By-pass in body, 53 drill size.
Economizer in body, .059-.060 inch diameter.
Idle bleed, No. 52 drill size.

Idle Port: Length, .175 inch. Width, .030 inch.

Idle Port Opening: .137 to .141 inch above upper edge of valve with valve closed tight.

Idle Screw Seat: No. 46 drill.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture, turn screw out. Do not attempt to idle engine below 350 r.p.m. or 7 m.p.h.

Main Nozzle: In primary venturi, angle 45°. Closed tip. Top hole No. 75 drill on 45° angle. Lower hole No. 47 drill on 70° angle.

Metering Rod: Standard: Economy step, .076 inch diameter. Power step, .040 inch diameter. Length of rod, 3-9/64 inches.

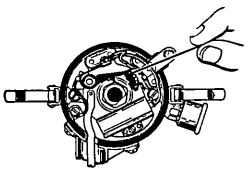
Metering Rod Jet: .0995 inch diameter.

Metering Rod Setting: Use gauge, part No. T109-102 (2.468 inches).

Accelerating Pump: Low pressure type, with adjustable stroke.
Discharge jet, No. 70 drill.
Intake ball check seat size, No. 62 drill in body.
Discharge ball check, seat size, No. 32 drill in body.
Relief passage to outside, No. 42 drill size.

Pump Adjustment: 27/64 inch plunger travel (long stroke). Use gauge T109-117S.

Choke: Carter Climatic® Control, set at index. Butterfly type, offset valve. Choke heat suction hole, in body, size No. 37 (.104 inch) drill (early production); No. 33 (.113 inch) drill (late production).



Vacuum Spark Port: 061-.064 inch diameter, bottom of port 022 to .027 inch above valve (early production). Bottom of port .020 to .030 inch above valve (late production).

Motor Tune-Up—Be Accurate!

Caution: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

BRIEF CARBURETER ADJUSTMENTS

Pump Adjustment: With throttle valve seated and connector link in upper hole in pump arm, pump plunger should travel 27/64" from closed to wide open position. Adjustment should be made by bending throttle connector rod at lower angle. Pump travel can be measured by using universal pump stroke gauge T109-117S by placing base of gauge on ridged portion of bowl cover so that indicator ear of pump gauge rests on top surface of connector link at pump shaft. Hold gauge vertical. The difference between the number shown by index mark on gauge, at wide open and closed positions, should be 27.

Metering Rod Adjustment: Correct setting of metering rod is important and must be made after pump adjustment. Insert gauge (Tool No. T109-102) in place of metering rod, seating tapered end in metering rod jet. Hold gauge vertical to insure seating. With throttle valve seated there should be less than .005" clearance between pin in pump arm and shoulder of notch in gauge. Gauge should not drag on pin. Adjustment should be made by bending metering rod pin portion of pump arm up or down.

Remove gauge, and install metering rod and disk. Connect metering rod spring.

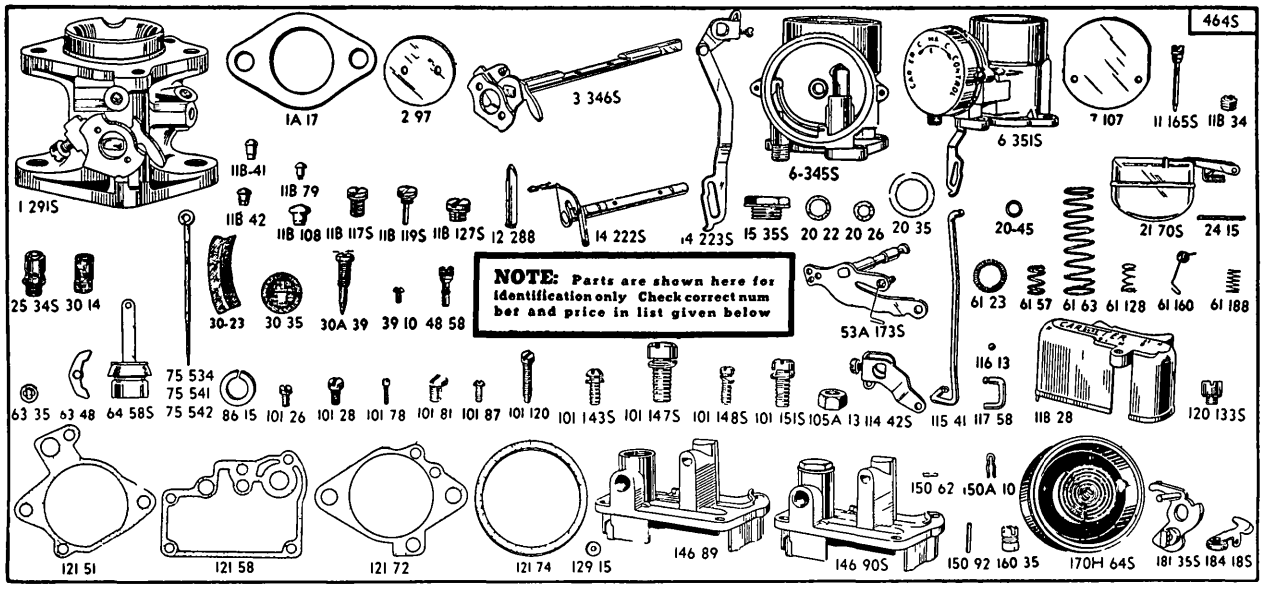
CARBURETER
TRADE MARK REG. U. S. PAT. FF.
MARCA REGISTRADA

PRINTED IN U.S.A.



Anti percolator Adjustment Crack throttle valve 020 by placing gauge T109-29 between valve and bore of carbureter (side opposite port) Bend rocker arm (Use tool T109 105) until there is a clearance of 005 to 015 between rocker arm and pump arm

Fast Idle Adjustment With fast idle cam held in normal idle position tighten throttle lever adjusting screw until it just seats against cam Hold throttle lever closed and pull cam back until first (or lower) step on cam is against (not on) set screw

There should now be 5/8 clearance between inside wall of air horn and lower edge of choke valve (Use tool T109 85) Adjustment can be made by bending at offset portion of fast idle link (Use tool T109-41)

Unloader Adjustment With throttle valve wide open there should be 31/64 clearance between lower edge of choke valve and inner wall of air horn (Use tool T109-82) Adjustment should be made by bending cam on throttle lever (Use tool T109-41)

Lock Out Adjustment With throttle and choke valves wide open choke should lock in wide open position Adjustment should be made by bending lip at lower end of fast idle link to give 1/32 clearance between lip and throttle lever lock, with throttle and choke valves held wide open (Use tool T109-105)

(780S can also be used)

WA-1 Down-Draft **Carbureter 611S** With Climatic® Control

CARBURETER SPECIFICATIONS

For Nash 611S—6 Cylinder Engine, 3 1/8" Bore, 3 3/4" Stroke

Dimensions: Flange size, 1 1/4 inch S. A. E.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 11/16 inch I. D.
Main venturi, 1 1/4 inch I. D.

Float Level: Distance from seam of float (at free end) to tip on lower edge of float chamber cover to be 1/2 inch when needle is seated. (See cut.)

Outside Vent: No. 10 drill size. No inside vent.

Gasoline Intake: Square vertical needle. No. 48 drill size in needle seat.

Low Speed Jet Tube: Jet No. 71 drill size.
By-pass in body, 53 drill size.
Economizer in body, .0755-.0765 inch diameter.
Idle bleed, No. 50 drill size.

Idle Port: Upper port .086 inch diameter.
Lower port .055 inch diameter.

Idle Port Opening: Top of lower port .011 to .015 inch above top edge of valve with valve tight closed.

Idle Screw Seat: No. 46 drill.

Set Idle Adjustment Screw: 1 1/4 to 2 1/4 turns open. For richer mixture, turn screw out. Do not attempt to idle engine below 350 r.p.m. or 7 m.p.h.

Main Nozzle: In primary venturi, angle 45°. Closed tip. Top hole .021 inch diameter on 45° angle. Lower hole .076 inch diameter on 70° angle.

Metering Rod: (Vacumeter Type) Economy step, .0775 inch diameter. Middle step tapers to .0715 inch diameter. Power step, .049 inch diameter. Length of rod 3-9/64 inches.

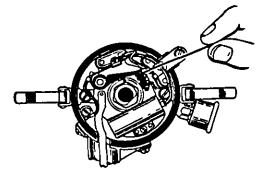
Metering Rod Jet: .096 inch diameter.

Metering Rod Setting: Use gauge, part No. T109-102 (2.468 inches).

Accelerating Pump: High pressure type, with seasonal adjustment. Summer setting (lower hole, short stroke). Intermediate setting (upper hole). Winter setting (outer hole, long stroke). Discharge jet, .025 inch diameter. Use tool No. T109-190 to remove.
Intake ball check seat size, No. 40 drill in body.
Discharge ball check, seat size, No. 32 drill in body.
Relief passage to outside, No. 42 drill size.

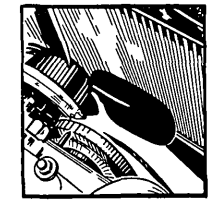
Pump Adjustment: 25/64 inch plunger travel (full throttle position with pump connector link in outer hole, long stroke). Use gauge T109-117S.

Choke: Carter Climatic® Control, set 2 points lean. Butterfly type, offset valve. Choke heat suction hole, in body. Size No. 42 (.0935) drill.



Vacuum Spark Port: .039 to .041 inch diameter. Bottom of port .021 to .029 inch above valve (early production). Bottom of port .010 to .020 inch above valve (later production).

Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

Pump Adjustment: With throttle valve seated and connector link in outer hole of pump arm, pump plunger should travel 25/64" from seated to wide open position. Adjustment should be made by bending throttle connector rod at lower angle. Pump travel can be measured by using universal pump stroke gauge T109-117S, placing base of gauge on ridged portion of bowl cover so that indicator ear of pump gauge rests on top surface of connector link where it extends through plunger shaft. Hold gauge vertical. The difference between the number shown by index mark on gauge, at wide open and closed positions, should be "25." Link position may be changed to accommodate climatic conditions after adjustment has been made.

Metering Rod Adjustment: Correct setting of metering rod is important and must be made after pump adjustment. Procedure is as follows:

(1) Back out throttle lever set screw to seat throttle valve.
(2) Insert metering rod gauge T109-102 in place of metering rod, seating tapered end in metering rod jet.
(3) Press lightly on vacuum piston link until lip contacts pin on pump operating lever. There should be less than .005" between metering rod pin and shoulder in notch of gauge.
(4) Adjustment can be made by bending lip of vacuum piston link.

Remove gauge and install metering rod and disk. Connect metering rod spring.

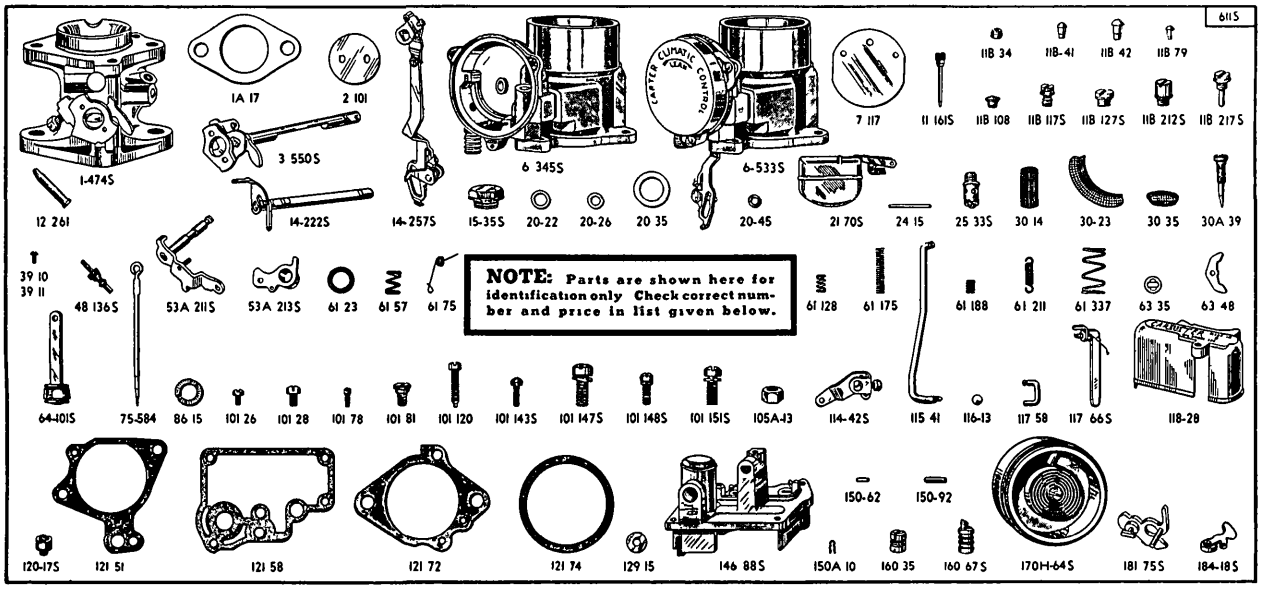
MARCA REGISTRADA

PRINTED IN U.S.A.

Anti-Percolator Adjustment. Crack throttle valve .030" by placing gauge T109-29 between valve and bore of carbureter (side opposite port) Bend rocker arm (Use tool T109-105) until there s a clearance of .005" to .015" between rocker arm and pump arm



Fast Idle Adjustment With fast idle cam held in normal idle position, tighten throttle lever adjusting screw until it just touches cam Hold throttle closed and pull cam back until first (or lower) step on cam is against (not on) set screw

There should now be 5/8" clearance between inside wall of air horn and lower edge of choke valve (Use tool T109-85)

Adjustment can be made by bending at offset portion of fast idle link (Use tool T109-41.)

Unloader Adjustment: With throttle valve wide open there should be 7/16' clearance between lower edge of choke valve and inner wall of air horn (Use gauge T109-81) Adjustment should be made by bending arm on throttle lever using tool T109-41

Lock-Out Adjustment. With throttle and choke valves wide open, choke should lock in wide open position Adjustment should be made by bending lip at lower end of fast idle link to give 1/32" clearance between lip and throttle lever lock

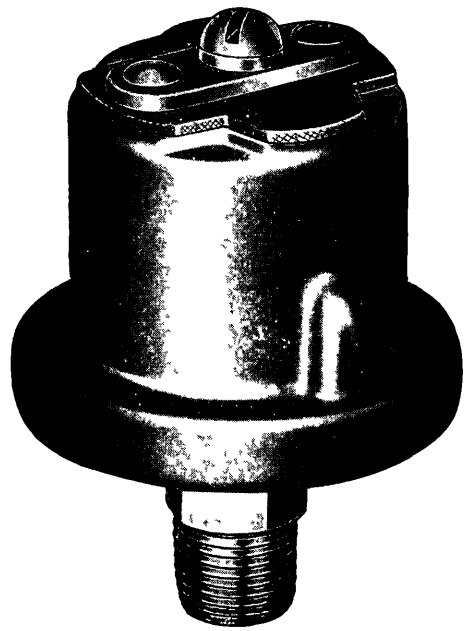
172-21	THROTTLE CONNECTOR ROD RETAINER (Use with 115-122)	
181-75S	Fast idle cam and pin assembly	
184-18S	ANTI-PERCOLATOR CAP AND ROCKER ARM ASSEMBLY	

†Install 63-104 retainer ring with prongs away from body casting Press ring firmly against casting before installing throttle lever

★Use unitized package No 52-40U (48-151S pump jet and 52-39 manifold sleeve assembly) on all carbureters produced prior to July, 1947 which have not already had these parts installed

NOTE Figures in parentheses indicate number of pieces used in one carbureter Where no figure is shown, only one is used

OIL PRESSURE WARNING SWITCH



NASH

MODELS

Statesman Six "5240", "5340", "5440"—1952-1954

Ambassador Six "5260", "5360", "5460"—1952-1954

Rambler Six "5010", "5110", "5210", "5310", "5410"—1950-1954

A954S Oil Pressure Warning Switch

With ignition switch on and engine stopped, or before oil pressure reaches normal, the A954S Oil Pressure Warning Switch is closed and grounded completing the circuit to warning light on dash. When the oil pressure reaches normal operating pressure (5 to 8 lbs.) the switch operates as follows: The diaphragm, which is actuated by oil pressure, separates the contact points and the circuit is broken, extinguishing warning light. No adjustment of the switch is necessary as the calibration is set and sealed at the factory.

To insure efficient operation and long life, the Carter Oil Pressure Switch is equipped with silver contact points which are protected against moisture and corrosion.

WCFB Four-Bore Down-Draft Climatic® Control **Carbureter No. 2246S**

CARBURETER SPECIFICATIONS

For Oldsmobile 8 Cylinder Engine: 3⅞ Inch Bore, 3-7/16 Inch Stroke

Dimensions: Flange size, 1⅛ inch Four Bore—4 bolt type
Primary venturi size, 11/32 inch I. D.
Main venturi (primary) size, 1-1/16 inch.
Main venturi (secondary) size, 15/16 inch I. D

Float Level: See adjustments.

Vents: Outside, none. Inside, balance vent tube in air horn, 2 on primary side, 3 on secondary side.

Gasoline Intake: Size No. 42 (.0935 inch) drill hole in needle seat.

Low Speed Jet Tube: (Primary side only).
Jet, pressed in place (DO NOT REMOVE) size No. 68 (.031 inch) drill.
By Pass, in body, size No. 52 (.0635 inch) drill.
Economizer, in screw plug, size No. 57 (.043 inch) drill.
Idle bleed, in body, size No. 52 (.0635 inch) drill.

Idle Port: (Upper) slot type. Primary, length .174 inch; width .040 inch. Secondary, none.

Idle Port Opening: Primary, .113 to .119 inch above top edge of valve with valve tightly closed. Secondary, none.

Lower Port: Primary (for idle adjustment screw), size No. 53 (.0595 inch) drill. Secondary, none.

Set Idle Adjustment Screw: 1 to 2 turns open. For richer mixture turn screw out Do not idle engine below 400 r.p.m. (Hydra-matic Trans.—in Drive Range), 425 r.p.m. (Std. Trans.).

Main Nozzle: Installed permanently. DO NOT REMOVE. Anti-percolating jet (off nozzle well), size No. 60 (.040 inch) drill.

Metering Rod: Primary, economy step .07275 inch diameter. Middle step tapers to .06975 inch diameter. Power step, .058 inch diameter. Secondary, none.

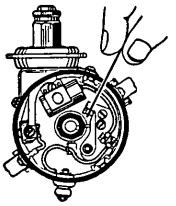
Metering Rod Jet: Primary, size .0935 inch diameter (for metering rod).
Secondary, size No. 53 (.0595 inch) drill (no metering rod).

Metering Rod Setting: See adjustments.

Accelerating Pump: Discharge jet (twin) primary side only size No. 67 (.032 inch) drill.
Intake ball check seat, size .115 to .120 inch diameter.
Discharge needle seat, size .070 inch diameter.
Relief passage (vent) to fuel chamber No. 42 (.0935 inch) drill.

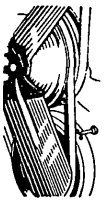
Pump Adjustment: See adjustments.

Choke: Carter Climatic® Control, set on index. Butterfly type—offset choke valve, primary side only. Choke heat suction hole, restriction in piston housing, size No. 43 (.089 inch) drill.

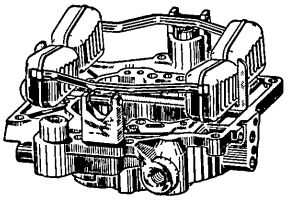


Vacuum Spark Port: Horizontal slot (round end) .045 x .110 inch. Top of port .018 to .028 inch above valve with valve tightly closed

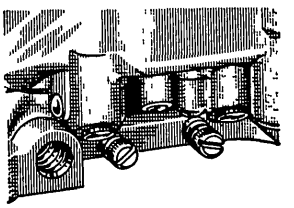
Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap 030"



Breaker Point Setting .016"

Ignition Timing 5° B. T. D. C. With Engine Idling at 850 R.P.M. (Distributor vacuum line disconnected)

Float Setting See Adjustments

Idle Adjustment Screw Setting 1 to 2 Turns Open

NOTE: These cars are equipped with hydraulic valve lifters.—NO ADJUSTMENT.

CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

S S PRINTED IN U.S.A.

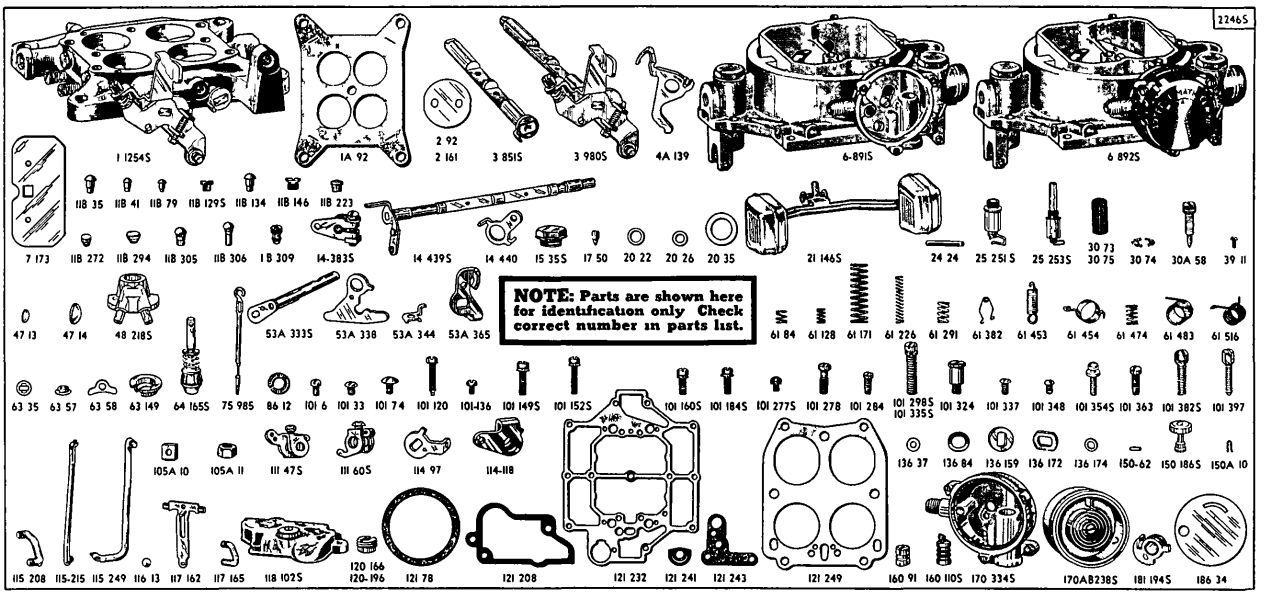
CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT Two separate float adjustments must be made — lateral and vertical **LATERAL ADJUSTMENT** With bowl cover assembly inverted bowl cover gasket removed and float resting on seated needle place float gauge (T109 222) directly under floats with notched portion of gauge fitted over edge of casting S de of floats should just clear the vertical uprights of float gauge Adjustment should be made by bend ing arms of float. **VERTICAL ADJUSTMENT** With float gauge in same position floats should just clear the horizontal portion of gauge Vertical distance between top of float and machined surface of casting must be 3/16 inch for both primary and sec ondary floats (gauge T109 222) Adjust by bend ng float arms

FLOAT DROP ADJUSTMENT With bowl cover held in upright position and measuring from center of float the distance be tween top of floats and bowl cover should be 11/16 inch for both primary and secondary floats Adjust by bending stop tabs on float brackets

PUMP ADJUSTMENT Install pump connector link in outer hole (long stroke) of pump arm with ends extending toward counter shaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at lower angle (Use tool T109 213)

METERING ROD ADJUSTMENT Metering rod adjustment is important and must be made after completing the pump ad justment No metering rod gauges are necessary Procedure is as follows 1 Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen meter ing rod arm clamp screw 2 With metering rods in place press down on vacumeter link until metering rods bottom in carbureter body casting 3 Holding rods in downward position and throttle valves seated revolve metering rod arm until finger on arm contacts lip of vacumeter link Hold in place and care fully tighten clamp screw



BOWL VAPOR VENT ADJUSTMENT This adjustment should be made after completing pump and metering rod adjustments Install dust cover and dust cover gasket Back out throttle leve set screw to allow throttle valves to seat in bores of carbureter There should be 1/16 inch (gauge T109 197) between lower edge of bowl vapor vent valve and dust cover To adjust remove dust cover and bend vapor vent arm

FAST IDLE ADJUSTMENT (a) Loosen choke lever clamp screw on choke shaft Insert 020 inch feeler gauge (T109 29) be tween lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by press ng choke lever towards closed position—hold in place and tighten clamp screw (b) With choke valve tightly closed tighten fast dle adjusting screw until there is 015 inch (gauge T109 44) opening between throttle valve and bore of carbureter side opposite idle port Be sure fast idle adjusting screw is on high step of cam while making this adjustment

UNLOADER ADJUSTMENT With throttle wide open there should be 3/16 inch (gauge T109 28) clearance between upper edge of choke valve and inner wall of air horn Adjust by bending unloader lip on throttle shaft lever (use bending tool T109 41)

SECONDARY THROTTLE LEVER ADJUSTMENT Primary and secondary throttle valves should reach wide open position at the same time To adjust bend throttle operating rod at upper angle (Use bending tool T109 213)

SECONDARY THROTTLE LOCK OUT ADJUSTMENT This ad justment should be made after completing fast idle and sec ondary throttle lever adjustments Crack throttle valves and hold choke valve tightly closed Then close throttle Tang on secondary throttle lever should freely engage in notch of lock out dog If necessary to adjust bend tang on secondary throt tle lever

WGD Dual Down-Draft Climatic® Control **Carbureter No. 2058S**

CARBURETER SPECIFICATIONS

For Oldsmobile 8 Cylinder Engine: 3⅞ Inch Bore, 3-7/16 Inch Stroke

Dimensions: Flange size, 1¼ inch dual, 4 bolt type.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 21/32 inch I. D.
Main venturi, 1-3/16 inch I. D.

Float Level: See adjustments.

Vents: Outside, none. Inside, balance vent tube above choke valve.

Gasoline Intake: Size No. 42 (.0935 inch) drill in needle seat.

Low Speed Jet Tube: Jet, size No. 67 (.032 inch) drill.
By pass, in bowl cover, size No. 53 (.0595 inch) drill.
Economizer, in bowl cover, size No. 57 (.043 inch) drill.
Idle bleed, in bowl cover, size No. 53 (.0595 inch) drill.

Idle Port: Upper, slot type, length .160 inch, width .030 inch.

Idle Port Opening: .109 to .115 inch above top edge of valve with valve tightly closed.

Lower Port (For Idle Adjustment Screw): Size, .0615 to .069 inch diameter.

Set Idle Adjustment Screw: 1½ to 2½ turns open. For richer mixture turn screw out. Do not idle engine below 400 r.p.m. (Hydramatic—in Drive Range) or 425 r.p.m. (Syncromesh Transmission).

Nozzle: Nozzle is installed permanently. DO NOT REMOVE.

Anti-percolating well jet, size No. 71 (.026 inch) drill.

Metering Rod (Vacumeter Type): Economy step, .0655 inch diameter. Power step .052 inch diameter. These rods designed with idle stabilizing flats on economy step.

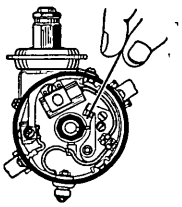
Metering Rod Jet: Size .086 inch diameter.

Metering Rod Setting: See adjustments.

Acceleratng Pump: Discharge jet (twin) size No. 70 (.028 inch) drill.
Pump jet air bleed passage to outside, ⅛ inch drill.
Intake ball check, in plunger shaft.
Discharge (needle seat) size No. 50 (.070 inch) drill.

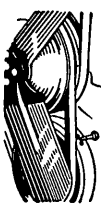
Pump Adjustment: See adjustments.

Choke: Carter Climatic® Control—set on index. Butterfly type, offset valve. Choke heat suction hole in piston housing, size No. 42 (.0935 inch) drill.

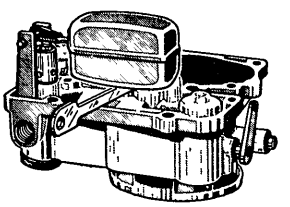


Vacuum Spark Port: Horizontal slot (round end) .045 x .110 inch. Top of port to be .028 inch above upper edge of valve with valve tightly closed.

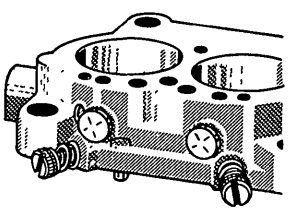
Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .030"



Breaker Point Setting .016"

Ignition Timing Breaker Points to Open: 5° B.T.C. With Engine Idling at 850 R.P.M. (Distributor Vacuum Line Disconnected)

Float Setting ¼" (Use Gauge T109-31)

Idle Adjustment Screw Setting 1½ to 2½ Turns Open

NOTE: These cars equipped with hydraulic valve lifters.—No adjustment.

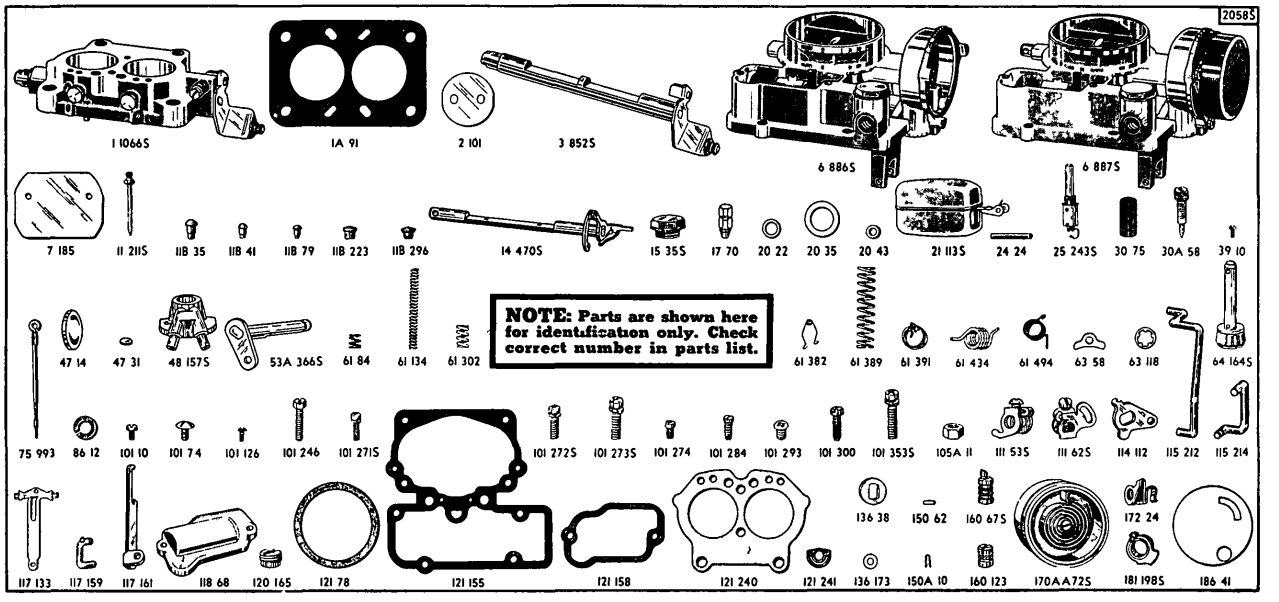
CARBURETER ADJUSTMENTS



Float Adjustment With bowl cover gasket removed bowl cover inverted and needle seated there should be 1/4 inch (gauge T109-31) between top of float and bowl cover Adjust by bending float arm

Pump Adjustment Back out throttle lever set screw until throttle valves seat in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending pump arm at upper angle Use bending tool T109 213

Metering Rod Adjustment The metering rods must be adjusted after the pump adjustment No metering rod gauges are necessary procedure is as follows With the throttle lever set screw backed out and throttle valves seated in bores of carbureter press down on vacumeter link until metering rods bottom in casting With rods held in this position, revolve metering rod arm until lip contacts vacumeter link Hold in place and carefully tighten metering rod arm set screw

Fast Idle Adjustment With the thermostatic coil housing gasket and baffle plate removed crack throttle valve and hold choke valve closed Then close throttle There should now be 020 inch clearance (gauge T109-29) between throttle valve and bore of carbureter (side opposite idle port) Adjust by bending the choke connector rod at lower angle

Unloader Adjustment This adjustment must be made after fast idle adjustment Hold throttle valve in wide open position and close choke valve as far as possible without forcing There should be 7/32 inch (gauge T109-106) clearance between upper edge of choke valve and inner wall of air horn Adjust by bending choke shaft unloader arm (Use Bending Tool T109-105)

Oldsmobile—1954—Carbureter No. 2058S

Dimensions: Flange size, 1⅛ inch Four Bore—4 bolt type.
Primary venturi size, 11/32 inch I. D.
Main venturi (primary) size, 1-1/16 inch.
Main venturi (secondary) size, 15/16 inch I. D.

Float Level: See adjustments.

Vents: Outside, none. Inside, balance vent tube in air horn, 2 on primary side, 3 on secondary side.

Gasoline Intake: Size No. 42 (.0935 inch) drill hole in needle seat.

Low Speed Jet Tube: (Primary side only).
Jet, pressed in place (DO NOT REMOVE) size No. 68 (.031 inch) drill.
By Pass, in body, size No. 52 (.0635 inch) drill.
Economizer, in screw plug, size No. 57 (.043 inch) drill.
Idle bleed, in body, size No. 52 (.0635 inch) drill.

Idle Port: (Upper) slot type. Primary, length .174 inch; width .040 inch. Secondary, none.

Idle Port Opening: Primary, .113 to .119 inch above top edge of valve with valve tightly closed. Secondary, none.

Lower Port: Primary (for idle adjustment screw), size No. 53 (.0595 inch) drill. Secondary, none.

Set Idle Adjustment Screw: 1 to 2 turns open. For richer mixture turn screw out. Do not idle engine below 400 r.p.m. (Hydra-matic Trans.—in Drive Range), 425 r.p.m. (Std. Trans.).

Main Nozzle: Installed permanently. DO NOT REMOVE. Anti-percolating jet (off nozzle well), size No. 60 (.040 inch) drill.

Metering Rod: Primary, economy step .07275 inch diameter. Middle step tapers to .06975 inch diameter. Power step, .058 inch diameter. Secondary, none.

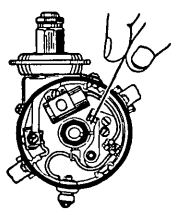
Metering Rod Jet: Primary, size .0935 inch diameter (for metering rod).
Secondary, size No. 53 (.0595 inch) drill (no metering rod).

Metering Rod Setting: See adjustments.

Accelerating Pump: Discharge jet (twin) primary side only size No. 67 (.032 inch) drill.
Intake ball check seat, size .115 to .120 inch diameter.
Discharge needle seat, size .070 inch diameter.
Relief passage (vent) to fuel chamber No. 42 (.0935 inch) drill.

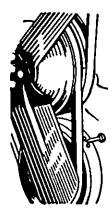
Pump Adjustment: See adjustments.

Choke: Carter Climatic® Control, set on index. Butterfly type—offset choke valve, primary side only. Choke heat suction hole, restriction in piston housing, size No. 43 (.089 inch) drill.



Vacuum Spark Port: Horizontal slot (round end) .045 x .110 inch. Top of port .018 to .028 inch above valve with valve tightly closed.

Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER
TRADE MARK RE . U. S. PAT. OFF.
MARCA REGISTRADA

S. S. PRINTED IN U.S.A.

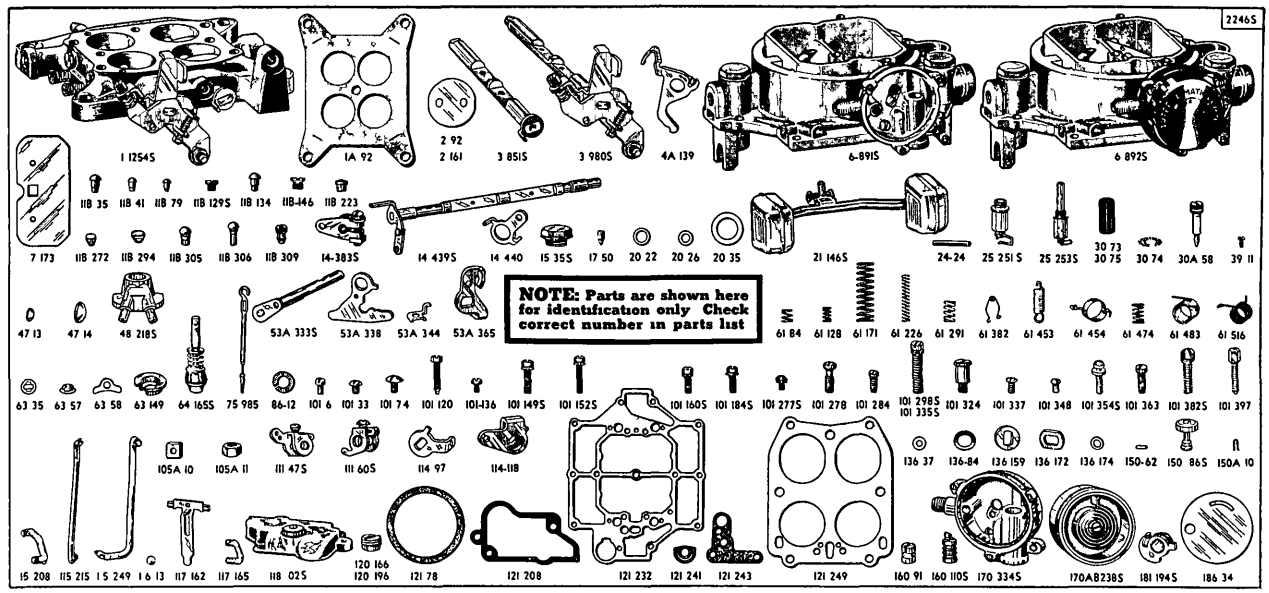
CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made — lateral and vertical. **LATERAL ADJUSTMENT:** With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge (T109-223) directly under floats with notched portion of gauge fitted over edge of casting. Side of floats should just clear the vertical uprights of float gauge. Adjustment should be made by bending arms of floats. **VERTICAL ADJUSTMENT:** With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance between top of float and machined surface of casting must be 1/4 inch for both primary and secondary floats (gauge T109-223). Adjust by bending float arms.

FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of float, the distance between top of floats and bowl cover should be 3/4 inch for both primary and secondary floats. Adjust by bending stop tabs on float brackets.

PUMP ADJUSTMENT: Install pump connector link in outer hole (long stroke) of pump arm, with ends extending toward countershaft arm. Back out throttle lever set screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at lower angle. (Use tool T109-213.)

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. 2. With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.



BOWL VAPOR VENT ADJUSTMENT: This adjustment should be made after completing pump and metering rod adjustments. Install dust cover and dust cover gasket. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter. There should be 1/16 inch (gauge T109-197) between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm

FAST IDLE ADJUSTMENT: (a) Loosen choke lever clamp screw on choke shaft Insert .020 inch feeler gauge (T109-29) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw. (b) With choke valve tightly closed, tighten fast idle adjusting screw until there is .015 inch (gauge T109-44) opening between throttle valve and bore of carbureter, side opposite idle port. Be sure fast idle adjusting screw is on high step of cam while making this adjustment.

UNLOADER ADJUSTMENT: With throttle wide open there should be 3/16 inch (gauge T109-28) clearance between upper edge of choke valve and inner wall of air horn. Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

SECONDARY THROTTLE LEVER ADJUSTMENT: Primary and secondary throttle valves should reach wide open position at the same time. To adjust, bend throttle operating rod at upper angle. (Use bending tool T109-213.)

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: This adjustment should be made after completing fast idle and secondary throttle lever adjustments. Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. If necessary to adjust, bend tang on secondary throttle lever.

For Oldsmobile 8 Cylinder Engine: 3¾ Inch Bore, 3-7/16 Inch Stroke

Dimensions: Flange size, 1⅛ inch Four Bore—4 bolt type.
Primary venturi size, 11/32 inch I. D.
Main venturi (primary) size, 1-1/16 inch.
Main venturi (secondary) size, 15/16 inch I. D.

Float Level: See adjustments.

Vents: Outside, none. Inside, balance vent tube in air horn, 2 on primary side, 1 on secondary side.

Gasoline Intake: Size No. 42 (.0935 inch) drill hole in needle seat.

Low Speed Jet Tube: (Primary side only)
Jet, size No. 68 (.031 inch) drill.
By-pass, size .0492 inch diameter.
Economizer, size No. 57 (.043 inch) drill.
Idle bleed, size No. 53 (.0595 inch) drill.

Idle Port: (Upper) slot type. Primary, length .164 inch; width .040 inch. Secondary, none.

Idle Port Opening: Primary, .108 to .114 inch above top edge of valve with valve tightly closed. Secondary, none.

Lower Port: Primary (for idle adjustment screw), size No. 53 (.0595 inch) drill. Secondary, none.

Set Idle Adjustment Screw: 1¾ to 2¾ turns open. For richer mixture turn screw out. Do not idle engine below 375 r.p.m. (Hydra-matic Trans.—in Drive Range); 425 r.p.m. (Synchro-mesh Trans.).

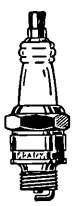
Main Nozzle: Installed permanently. **Do Not Remove.** Anti-percolating jet (off nozzle well), size No. 60 (.040 inch) drill.

Metering Rod: Primary, economy step .07125 inch diameter.
Middle step tapers to .067 inch diameter.
Power step, .050 inch diameter. (These rods designed with stabilizing flats on economy step.)
Secondary, none.

Metering Rod Jet: Primary, size .0935 inch diameter (for metering rod).
Secondary, size No. 52 (.0635 inch) drill (no metering rod)

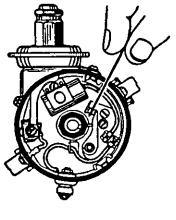
Metering Rod Setting: See adjustments.

Accelerating Pumps: Discharge jet (twin) primary side only, size No. 68 (.031 inch) drill.
Intake ball check seat, size .115 to .120 inch diameter.
Discharge needle seat, size .070 inch diameter.
Relief passage (vent) to fuel chamber No. 42 (.0935 inch) drill.



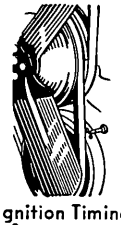
Pump Adjustment: See adjustments.

Choke: Carter Climatic ® Control, set on index. Butterfly type—offset choke valve, primary side only. Choke heat suction hole, restriction in piston housing, size No. 43 (.089 inch) drill.



Vacuum Spark Port: Horizontal slot (round end) .045 x .110 inch. Top of port .018 to .028 inch above valve with valve tightly closed.

Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

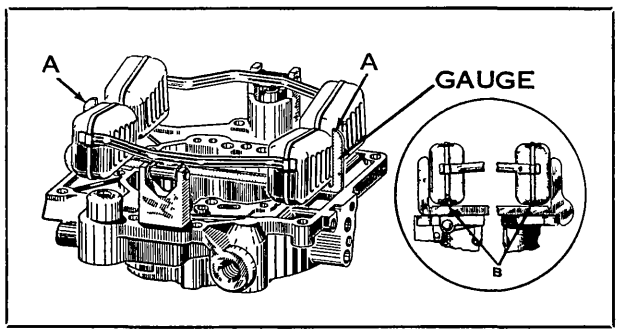

Figure 1
Float Adjustment

FLOAT ADJUSTMENT (Fig. 1):

Two separate float adjustments must be made—lateral and vertical. LATERAL ADJUSTMENT With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle place float gauge (T109 222) directly under floats with notched portion of gauge fitted over edge of casting Side of floats should just clear the vertical uprights of float gauge (A) Adjustment should be made by bending arms of floats VERTICAL ADJUSTMENT With float gauge in same position floats should just clear the horizontal portion of gauge Vertical distance (B) between top of float and machined surface of casting must be 3/16 inch for both primary and secondary floats (gauge T109 222) Adjust by bending float arms

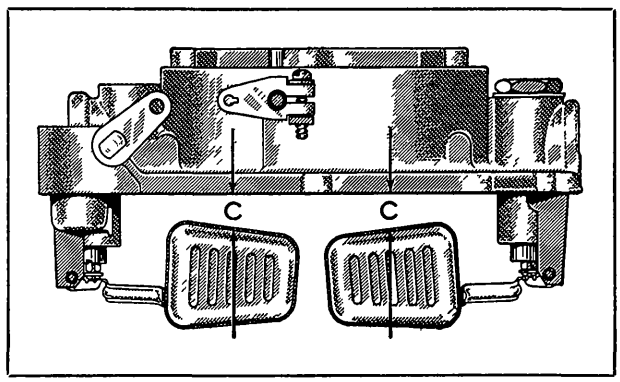

Figure 2
Float Drop Adjustment

FLOAT DROP ADJUSTMENT (Fig. 2):

With bowl cover held in upright position and measuring from center of float (C), the distance between top of floats and bowl cover should be 1/2 inch (2016S), 11/16 inch (2080S) for both primary and secondary floats Adjust by bending stop tabs on float brackets

PUMP ADJUSTMENT (Fig. 3):

Install pump connector link in outer hole (long stroke) of pump arm (D) with ends extending toward countershaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at lower angle (E) (Use tool T109-213) OPTIONAL ADJUSTMENT With throttle valves seated in bores of carbureter, the distance from the top of the plunger shaft to the top of the dust cover boss should be 18/64 inch (F) Adjust as mentioned above

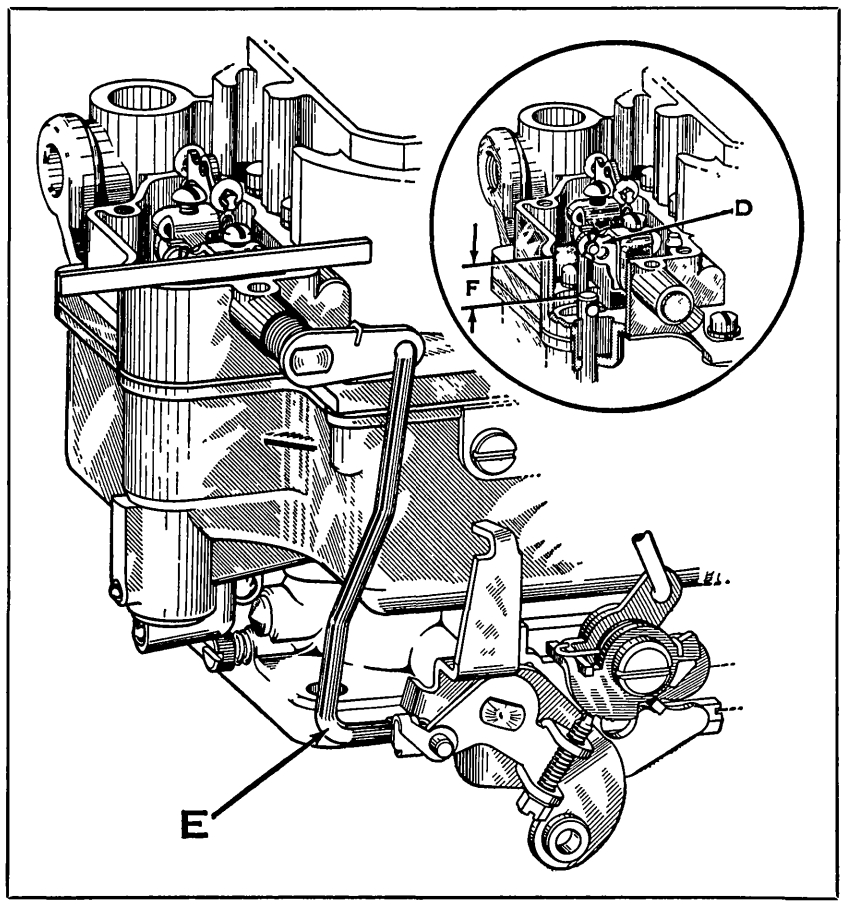

Figure 3
Pump Adjustment

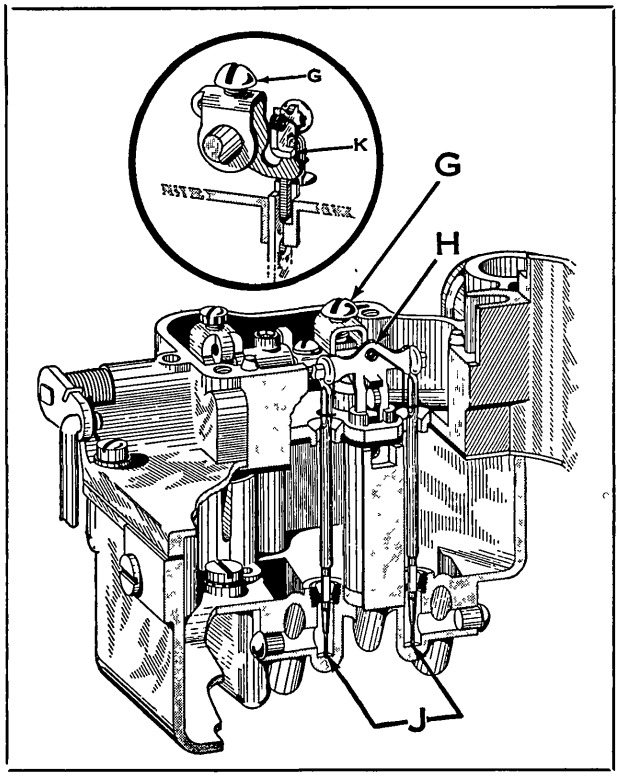

Figure 4
Metering Rod Adjustment

METERING ROD ADJUSTMENT (Fig. 4):
Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw (G). 2. With metering rods in place, press down on vacumeter link (H) until metering rods bottom in carbureter body casting (J). 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip (K) of vacumeter link. Hold in place and carefully tighten clamp screw (G).

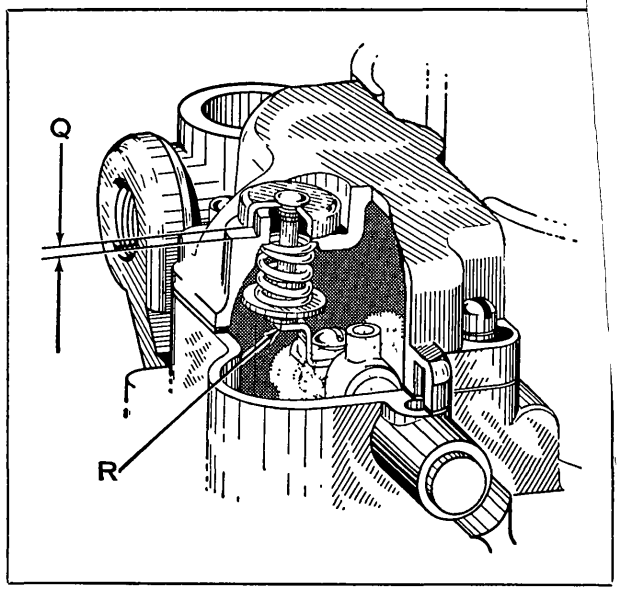

Figure 5
Bowl Vapor Vent Adjustment

BOWL VAPOR VENT ADJUSTMENT (Fig. 5):
This adjustment should be made after completing pump and metering rod adjustments. Install dust cover and dust cover gasket. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter. There should be 1/16 inch (Q) (gauge T109-197) between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm (R).

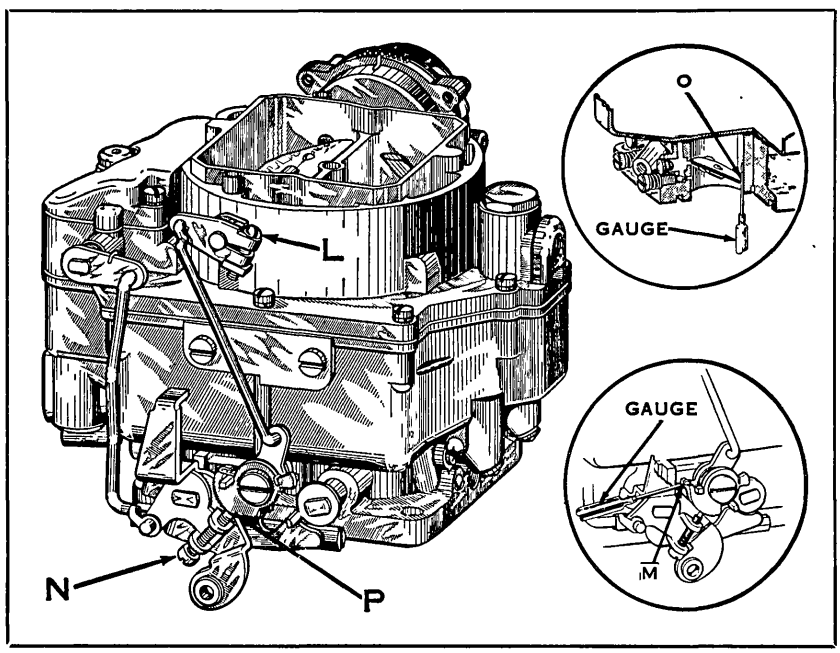

Figure 6
Fast Idle Adjustment

FAST IDLE ADJUSTMENT (Fig. 6):
(a) Loosen choke lever clamp screw (L) on choke shaft. Insert .020 inch feeler gauge (T109-29) between lip of fast idle cam and boss of flange casting (M). Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position — hold in place and tighten clamp screw (L). (b) With choke valve tightly closed, tighten fast idle adjusting screw (N) until there is .018 inch (gauge T109-44) opening between throttle valve and bore of carbureter, side opposite idle port (O). Be sure fast idle adjusting screw is on high step of cam (P), while making this adjustment.

CARBURETER
TRADE MARK REG U S PAT OFF
MARCA REGISTRADA

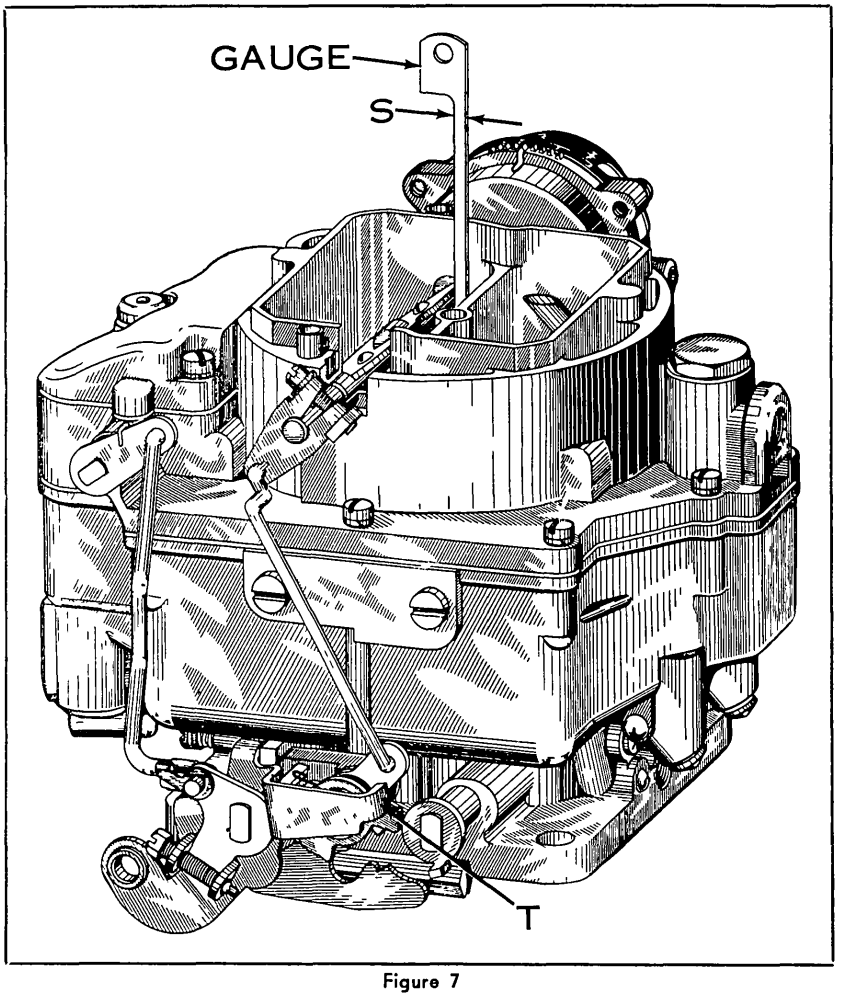

Figure 7
Unloader Adjustment

UNLOADER ADJUSTMENT (Fig. 7):

With throttle wide open there should be 3/16 inch (gauge T109-28) clearance (S) between **upper** edge of choke valve and inner wall of air horn.

Adjust by bending unloader lip (T) on throttle shaft lever (use bending tool T109-41)

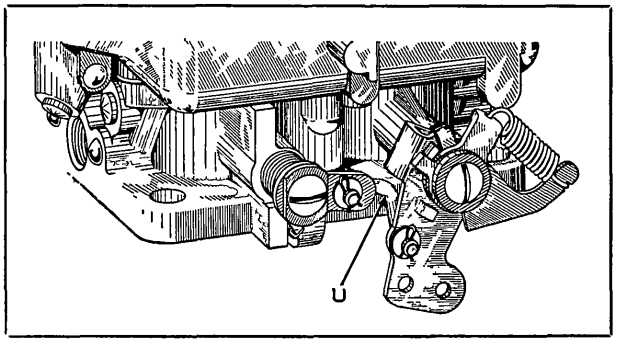

Figure 8
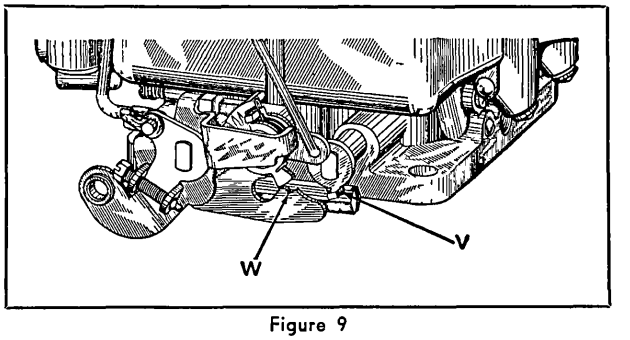
Secondary Throttle Lever Adjustment

SECONDARY THROTTLE LEVER ADJUSTMENT (Fig. 8):

Primary and secondary throttle valves should reach wide open position at the same time. To adjust, bend throttle operating rod at upper angle (U). (Use bending tool T109-213)



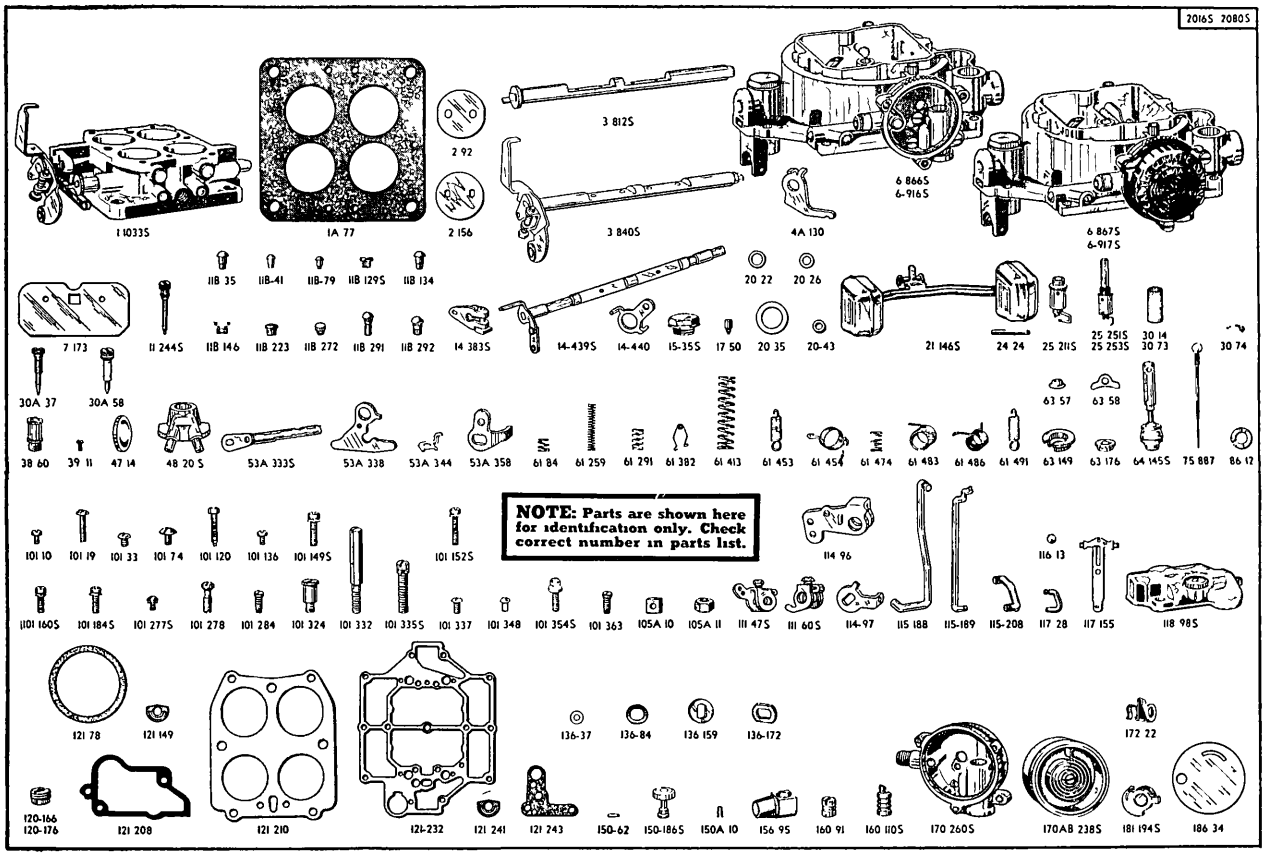


Figure 9
Secondary Throttle Lock-Out Adjustment

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT (Fig. 9):

This adjustment should be made after completing fast idle and secondary throttle lever adjustments. (a) With choke valve tightly closed, open primary throttle valves all the way. Tang (V) on secondary throttle arm should engage in notch (W) on lock out lever preventing secondary throttle shaft movement. (b) Hold choke valve in wide open position. Open primary throttle valves all the way. Lock-out lever should fall free allowing secondary throttle valves to be opened before primary throttle valves are fully open. If necessary, bend tang (V) on secondary throttle lever to provide clearance for proper operation of lock-out lever.

OLDSMOBILE 8 ROCKET ENGINE MODELS "88"-"98"—1951 DELUXE "88"—1952-1953

(2015S can be used in place of 851S-SA)

WGD **851S-851SA-2015S** Dual Down-Draft Climatic® Control Carbureters

CARBURETER SPECIFICATIONS

For Oldsmobile 8 Cylinder Engine: 3¾ Inch Bore, 3-7/16 Inch Stroke

Dimensions: Flange size, 1¼ inch dual, 4 bolt type.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 21/32 inch I. D.
Main venturi, 1-3/16 inch I. D.

Float Level: See adjustments.

Vents: Outside, none. Inside, balance vent tube, above choke valve.

Gasoline Intake: Size (851S) No. 38 (.1015") drill; (851SA-2015S) No. 42 (.0935") drill.

Low Speed Jet Tube: Jet size, No. 65 (.035") drill.
By-pass, size No. 55 (.052") drill (851S); No. 54 (.055") drill (851SA-2015S).
Economizer, size No. 62 (.038") drill.
Idle bleed, size No. 54 (.055") drill.

Idle Ports: Upper port, slot type. Length .130 inch. Width .030 inch.

Idle Port Opening: .079 to .085 inch above upper edge of valve with valve tightly closed.

Lower Port (For Idle Adjustment Screw): Size, .0615 to .0655 inch diameter.

Set Idle Adjustment Screw: ¾ to 1¼ turns open. For richer mixture turn screw out. Do not idle engine below 375 r.p.m. (Hydramatic—in Drive Range) or 425 r.p.m. (Syncromesh Transmission).

Nozzle: Nozzle is installed permanently. **DO NOT REMOVE.** Anti-percolating well jet, size No. 60 (.040 inch) drill.

Metering Rod (Vacumeter Type): Economy step, .0685 inch diameter. Middle step tapers to .059 inch diameter. Power step .048 inch diameter. These rods designed with idle stablizing flats on economy step.

Metering Rod Jet: .089 inch diameter.

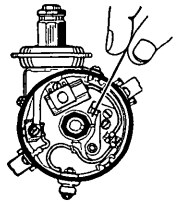
Metering Rod Setting: See adjustments.

Accelerating Pump: Discharge jet (twin) size No. 70 drill.
Pump jet air bleed passage to outside, ⅛ inch drill.
Intake ball check; Restriction (under ball check) size .100 inch diameter.

Discharge (needle seat) size No. 50 (.070") drill.

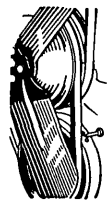
Pump Adjustment: See adjustments.

Choke: Carter Climatic® Control—set on index. Butterfly type, offset valve. Choke heat suction hole in piston housing, size No. 36 (.1065 inch) drill.

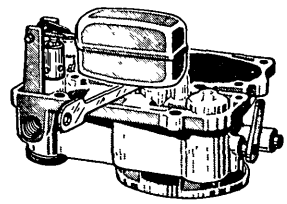


Vacuum Spark Port: 851S (Early Production): .039 to .041 inch diameter. 851S (Late Production): .051 to .053 inch diameter. 851SA-2015S: Horizontal slot (round end) .045 X .110 inch. Top of port .023 to .033 inch above upper edge of valve with valve tightly closed.

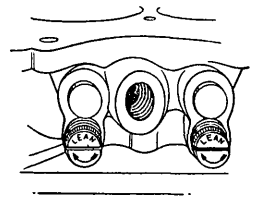
Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .030"



Breaker Point Setting .016"

Ignition Timing Breaker Points to Open:
(1951) 2° B.T.D.C.
(1952-53) 5° B.T.D.C.
With Engine Idling at 850 R.P.M.
(Distributor Vacuum Line Disconnected)

Float Setting ¼"
(Use Gauge T109-31)

Idle Adjustment Screw Setting ¾ to 1¼ Turns Open

NOTE: These cars equipped with hydraulic valve lifters.—No adjustment.

CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT (Fig. 1)·

With bowl cover gasket removed, bowl cover inverted and needle seated, there should be 1/4 inch (gauge T109-31) between top of float and bowl cover. Adjust by bending float arm.

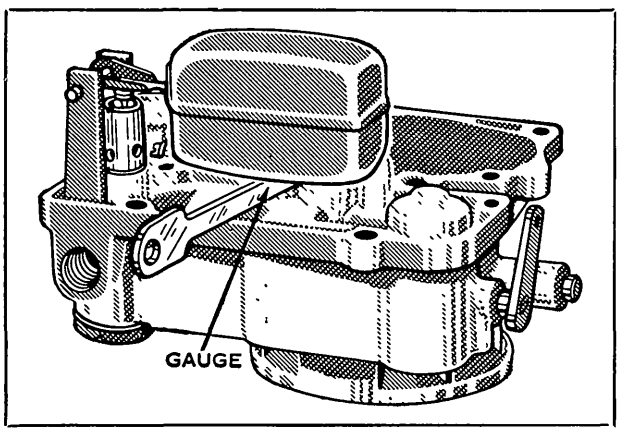

Figure 1
Float Adjustment

PUMP ADJUSTMENT (Fig. 2):

Install pump connector link in outer hole (long stroke) of pump arm, with ends extending toward countershaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending pump arm at upper angle (A)

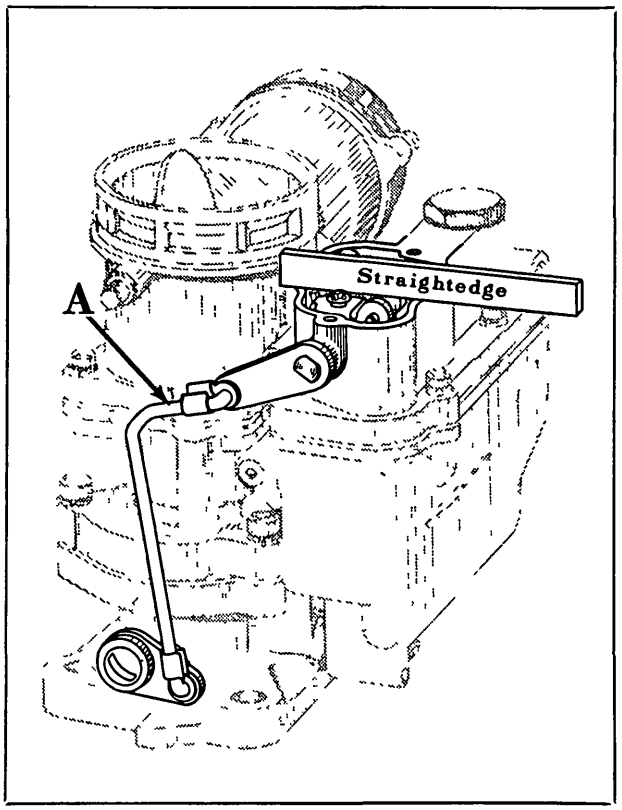

Figure 2
Pump Adjustment

METERING ROD ADJUSTMENT (Fig. 3):

The metering rods must be adjusted after the pump adjustment. No metering rod gauges are necessary; procedure is as follows: With the throttle lever set screw backed out and throttle valves seated in bores of carbureter, press down on vacumeter link (D) until metering rods bottom in casting at (E). With rods held in this position, revolve metering rod arm (F) until lip contacts vacumeter link at (G). Hold in place and carefully tighten metering rod arm set screw (H)

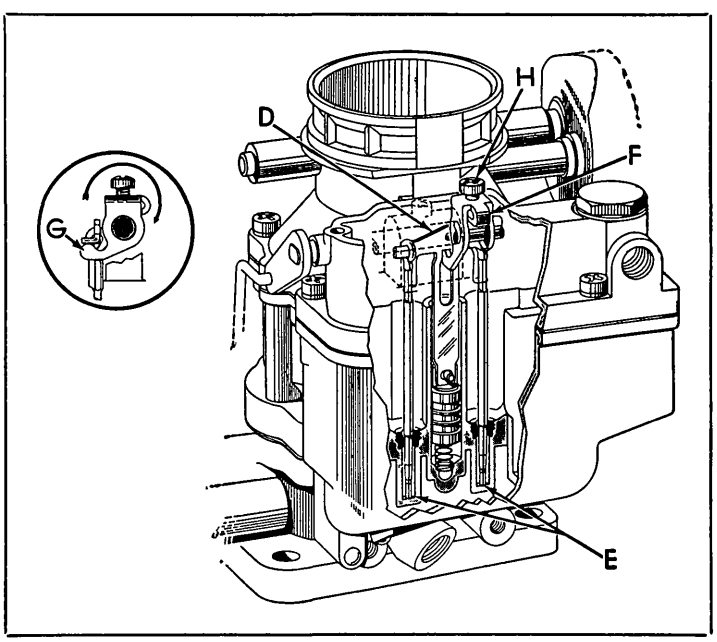

Figure 3
Metering Rod Adjustment

FAST IDLE ADJUSTMENT (Fig. 4)·

Remove thermostatic coil housing, gasket and baffle plate Crack throttle valve, and hold choke valve fully closed, then close throttle This will allow fast idle cam to revolve to fast idle position With choke valve held tightly closed and slight tension on throttle lever, loosen lock nut (J) on choke connector rod assembly and turn sleeve (K) until there is 020 inch (gauge T109-29) clearance (L) between throttle valve and bore of carbureter, side opposite idle port. Hold sleeve (K) in position and secure lock nut (J).

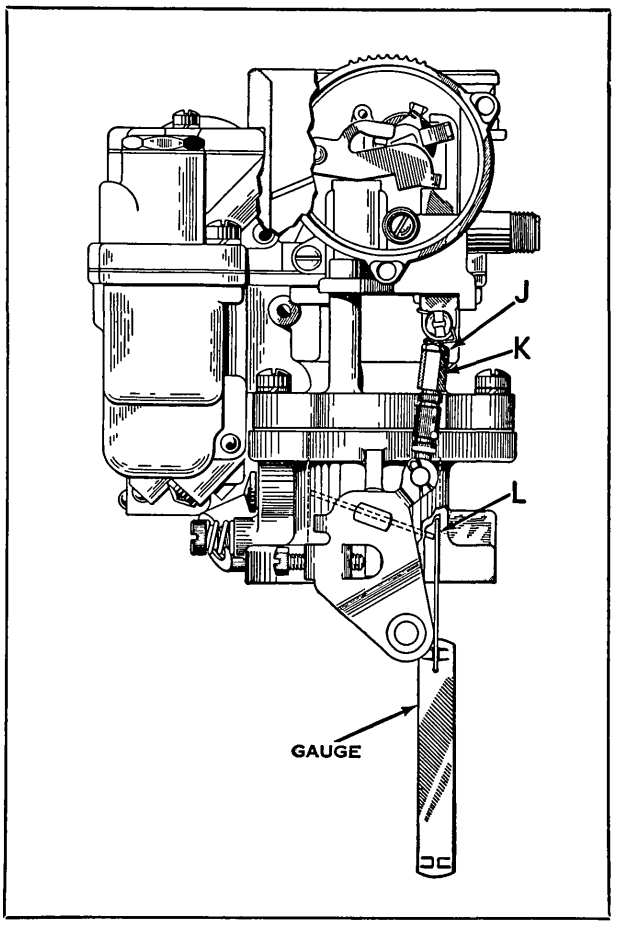

Figure 4
Fast Idle Adjustment

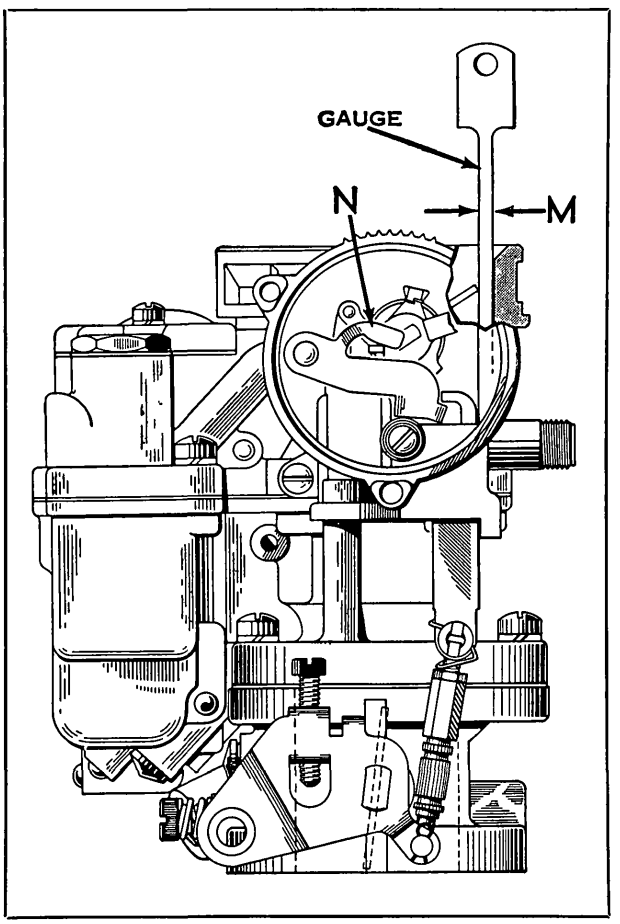

Figure 5
Unloader Adjustment

UNLOADER ADJUSTMENT (Fig. 5):

Must be made after fast idle adjustment. Hold throttle valve wide open and close choke valve as far as possible without forcing; there should now be 1/4 inch (gauge T109-31) clearance between upper edge of choke valve and inner wall of air horn (M). Adjust by bending arm on choke trip lever (N). (Tool T109-214)

FAST IDLE LINK SPRING (Fig. 6):

To prevent any possibility of the accelerator sticking in a wide open throttle position, part No. 61-443 should be installed as shown in Illustration "A" **All 851S carbureters produced prior to February 1951 (Code Date B1) should have the spring No. 61-443 installed.**

Model 851S carbureters bearing the Code Date "B1" (FEBRUARY 1951) and thereafter on the brass indentification tag will have in addition to the spring, a choke housing with a small amount of metal (O) added as shown in Illustration "B".

OLDSMOBILE 8 MODELS "SUPER 88" and "98" 1952

(2080S can also be used)

WCFB Four-Bore Down-Draft Climatic® Control **Carbureter No. 932S**

CARBURETER SPECIFICATIONS

For Oldsmobile 8 Cylinder Engine: 3¾ Inch Bore, 3-7/16 Inch Stroke

Dimensions: Flange size, 1⅛ inch Four Bore—4 bolt type.
Primary venturi size: 11/32 inch I. D.
Main venturi size: 1-1/16 inch I. D.

Float Level: Primary: Float setting ¼ inch.
Secondary: Float setting ¼ inch. See adjustments.

Vents: Outside, None.
Inside, balance vent tube, in air horn, (secondary side) ahead of choke valve.

Gasoline Intake: Size No. 42 (.0935 inch) drill hole in needle seat.

Low Speed Jet Tube: Jet size: No. 68 (.031 inch) drill.
By-pass size: No. 54 (.055 inch) drill.
Economizer size: No. 58 (.042 inch) drill.
Idle bleed size: No. 54 (.055 inch) drill.

Idle Ports: (Upper) Primary: Slot type, length .160 inch, width .030 inch.
Secondary: Round type, .076 inch diameter.
Opening, primary .089 to .095 inch above upper edge of valve, with valve tightly closed.
Opening, secondary, (.047 to .053 inch).

Idle Ports: (Lower) Primary: (for idle adjustment screw seat) Size No. 53 (.0595 inch) drill.

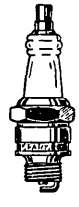
Set Idle Adjustment Screw: 1 to 2 turns open For richer mixture turn screw out. Do not idle engine below 375 R.P.M. (Hydra-Matic Trans.—in Drive range).

Vacuum Spark: Horizontal slot (round end) .045 x .110 inch.
Top of port .023 to .033 inch above valve.

Main Nozzle: Installed permanently. **Do Not Remove.**
Anti-percolating jet· (off idle well) Size No. 74 (.0225 inch) drill.
Nozzle bleed; Size No 60 (.040 inch) drill.

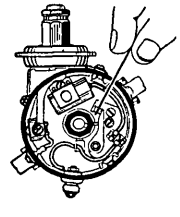
Metering Rod: Primary: Economy step .073 inch diameter.
Middle step tapers to .0675 inch diameter.
Power step, .058 inch diameter.
(These rods designed with stabilizing flats on economy step.)
Secondary: None.

Metering Rod Jet: Primary: Size .0935 inch diameter (for metering rod).
Secondary: Size .0635 inch diameter (no metering rod).



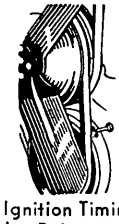
Metering Rod Setting: See adjustments.

Accelerating Pump: Pressure type, adjustable stroke.
Discharge jet (twin) primary only, Size No. 68 (.031 inch) drill.
Intake; ball check seat size .115 to .120 inch diameter.
Discharge; needle seat size .070 inch diameter.
Relief passage (vent) to fuel chamber No. 42 (.0935 inch) drill.

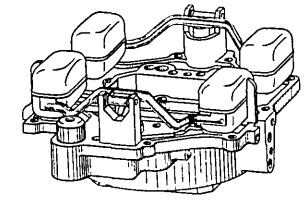


Choke: Carter Climatic® Control, set on index. Butterfly type —offset choke valve, primary side only. Choke heat suction hole, restriction in piston housing, Size: No. 43 (.089 inch) drill.

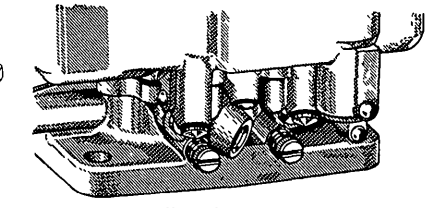
Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .030"



Breaker Point Setting .016"

Ignition Timing Breaker Points to Open: 5° B. T. D. C. With Engine Idling at 850 R.P.M. (Distributor vacuum line disconnected)

Float Setting Primary ¼ Inch Secondary ¼ Inch (Use Gauge T109-223)

Idle Adjustment Screw Setting 1 to 2 Turns Open

NOTE: These cars equipped with hydraulic valve lifters.—No adjustment.

CARBURETER ADJUSTMENTS

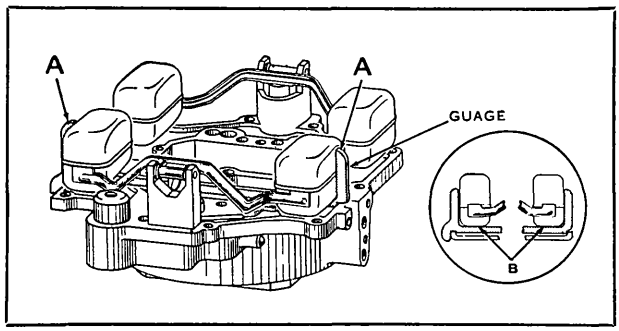

Figure 1
Float Adjustment

FLOAT ADJUSTMENT (Fig. 1):

Two separate float adjustments must be made—lateral and vertical. **LATERAL ADJUSTMENT:** With bowl cover assembly inverted bowl cover gasket removed and float resting on seated needle place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting Side of floats should just clear the vertical uprights of float gauge (A) Adjustment should be made by bending arms of floats

VERTICAL ADJUSTMENT: With float gauge in same position, floats should just clear the horizontal portion of gauge Vertical distance (B) between top of float and machined surface of casting must be 1/4" for both primary and secondary floats (gauge T109 223) Adjust by bending float arms

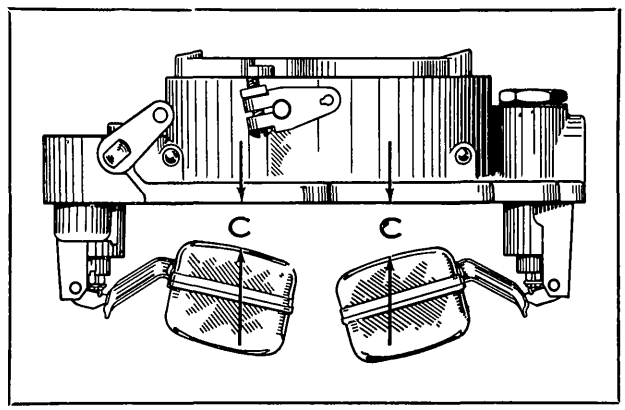

Figure 2
Float Drop Adjustment

FLOAT DROP ADJUSTMENT (Fig. 2):

With bowl cover held in upright position and measuring from center of float, the distance between top of floats and bowl cover should be 3/4" for both primary and secondary floats Adjust by bending stop tabs on float brackets

PUMP ADJUSTMENT (Fig. 3):

Install pump connector link in outer hole (long stroke) of pump arm (D) with ends extending toward counter shaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at lower angle (E) (Use tool T109-213)

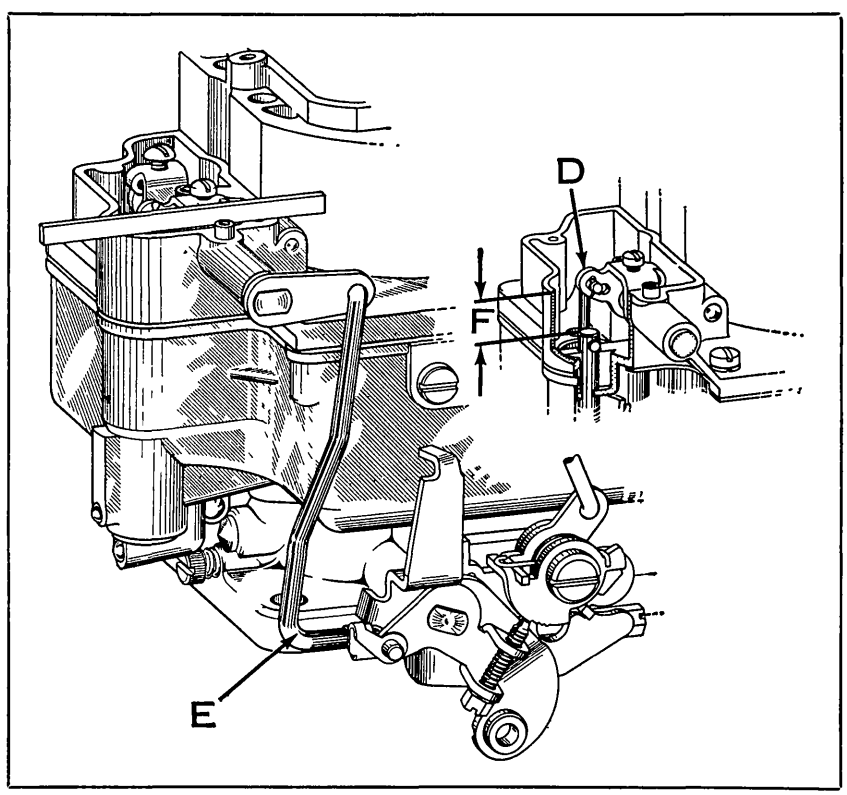

Figure 3
Pump Adjustment

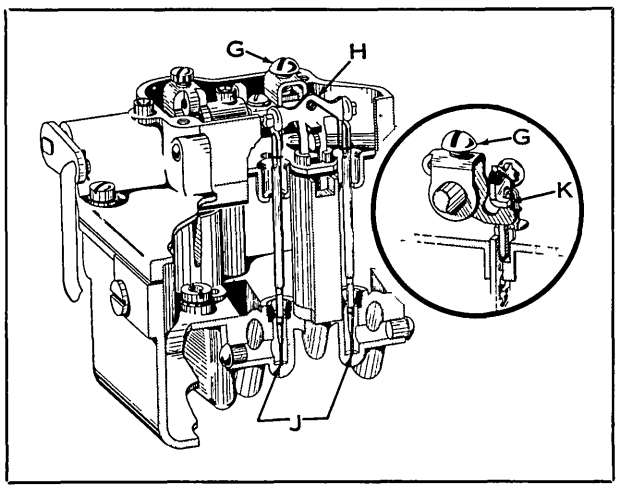

Figure 4
Metering Rod Adjustment

METERING ROD ADJUSTMENT (Fig. 4).

Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw (G). 2. With metering rods in place, press down on vacumeter link (H) until metering rods bottom in carbureter body casting (J). 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link (K). Hold in place and carefully tighten clamp screw (G).

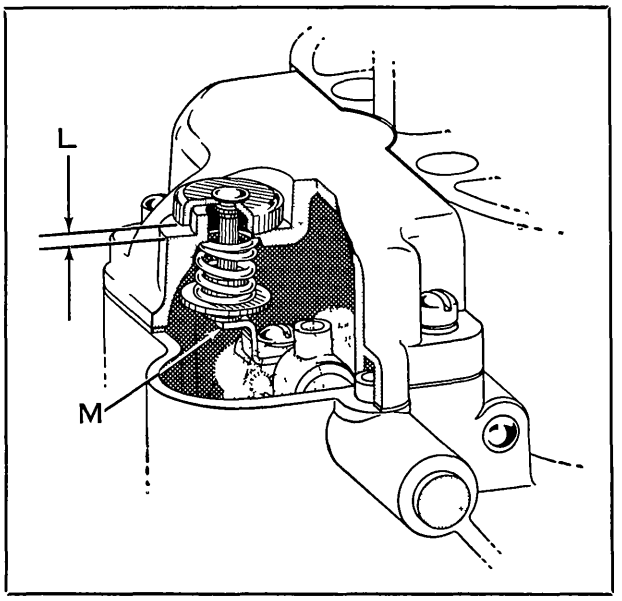

Figure 5
Bowl Vapor Vent Adjustment

BOWL VAPOR VENT ADJUSTMENT (Fig. 5):

This adjustment should be made after completing pump and metering rod adjustments Install dust cover and dust cover gasket. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter. There should be 3/32" (L) (gauge T109-125) between lower edge of bowl vapor vent valve and dust cover To adjust, remove dust cover and bend vapor vent arm (M).

FAST IDLE ADJUSTMENT (Fig. 6):

(a) Loosen choke lever clamp screw (N) on choke shaft Insert 020" feeler gauge T109 29 between lip of fast idle cam and boss of flange casting (O) Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw (N).

(b) With choke valve tightly closed tighten fast idle adjusting screw (P) until there is 018" (gauge T109 44) opening between throttle valve and bore of carbureter (side opposite idle port) (Q) Be sure fast idle adjusting screw is on high step of cam (R) while making this adjustment

CARBURETER
TRADE MARK REG U S PAT OFF
MARCA REGISTRADA

UNLOADER ADJUSTMENT (Fig. 7):

With throttle wide open there should be 1/8" clearance (S) between lower edge of choke valve and inner wall of air horn (gauge T109-36). Adjust by bending unloader lip (T) on throttle shaft lever (use bending tool T109-41)

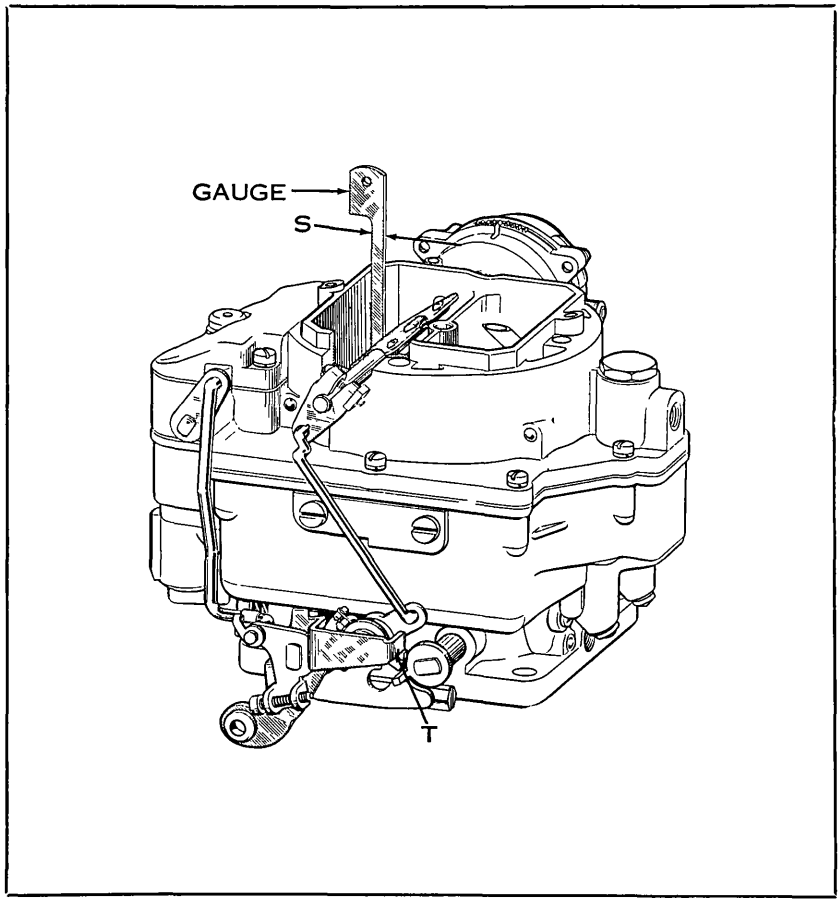

Figure 7
Unloader Adjustment

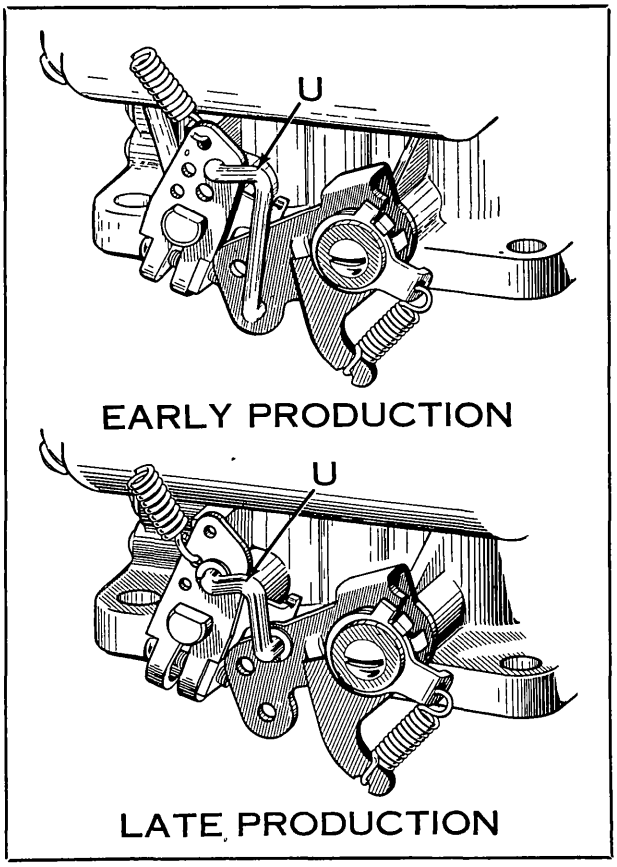

Figure 8
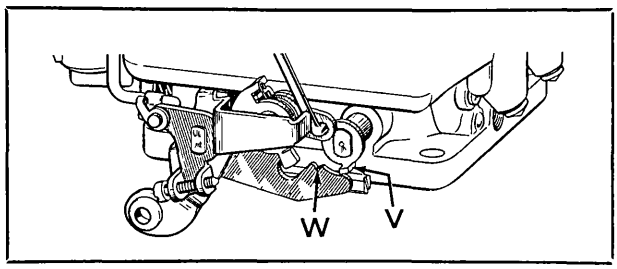
Secondary Throttle Lever Adjustment

SECONDARY THROTTLE LEVER ADJUSTMENT (EARLY AND LATE PRODUCTION) (Fig. 8):

Primary and secondary throttle valves should reach wide open position at the same time To adjust· Bend throttle operating rod at upper angle (U) (Use bending tool T109-213)



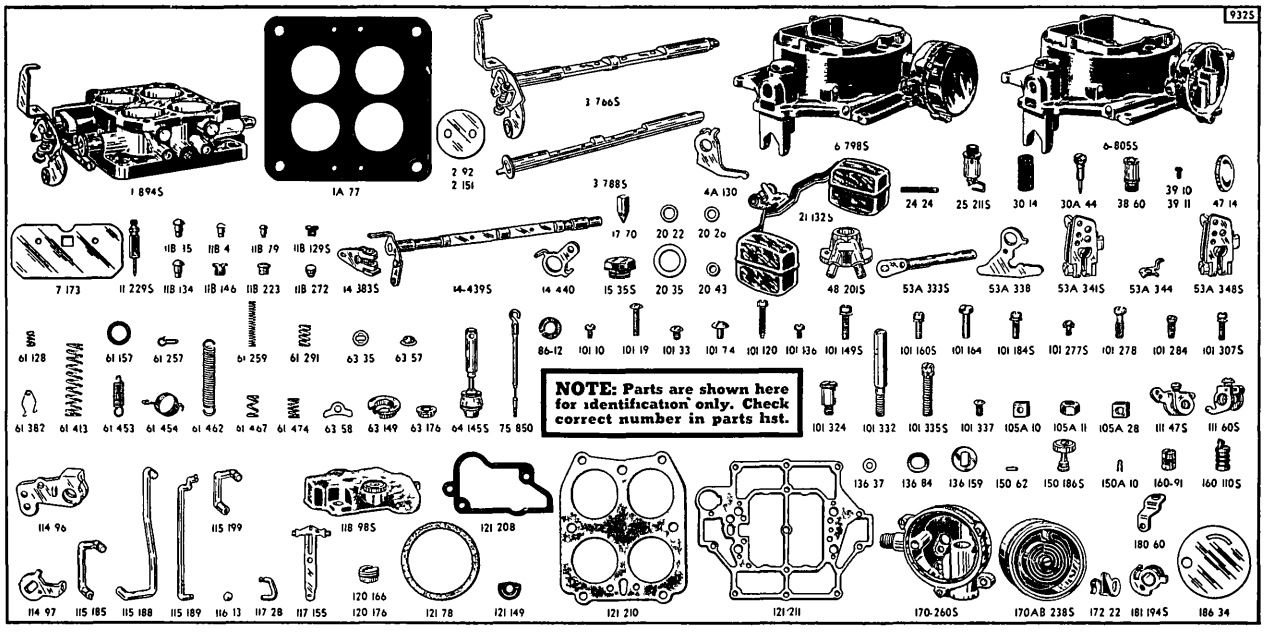


Figure 9
Secondary Throttle Lock-Out Adjustment

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT (Fig. 9)

This adjustment should be made after completing fast idle and secondary throttle lever adjustments (a) With choke valve tightly closed open primary throttle valves all the way Tang (V) on secondary throttle arm should engage in notch (W) on lock out lever preventing secondary throttle shaft movement (b) Hold choke valve in wide open position Open primary throttle valves all the way Lock-out lever should fall free allowing secondary throttle valves to be opened before primary throttle valves are fully open If necessary bend tang (V) on secondary throttle lever to provide clearance for proper operation of lock-out lever

CARBURETER SPECIFICATIONS

For Oldsmobile Six Cylinder Engine 3 17/32 Inch Bore, 4 3/8 Inch Stroke

Dimensions Flange size 1 1/2 inch S A E
Primary venturi 11/32 inch I D
Secondary venturi 11/16 inch I D
Main venturi 1 3/8 inch I D

Float Level Distance from seam of float (at free end) to tip on lower edge of float chamber cover when needle is seated to be 1/2 inch

Vents Outside No 10 drill Inside none

Gasoline Intake Square vertical (push pull) needle Size No 46 (.081") drill hole in needle seat

Low Speed Jet Tube Jet size No 65 (.035") drill
By pass size .063 inch diameter
Economizer .052 ± .0005 inch diameter
Idle bleed size No 52 (.0635") drill

Idle Port Length .190 inch Width .040 inch

Idle Port Opening .136 to .140 inch above valve with valve closed tight

Idle Screw Seat No 46 drill

Set Idle Adjustment Screw 1/2 to 1 1/2 turns open For richer mixture turn screw out Do not attempt to idle engine below 6 m p h

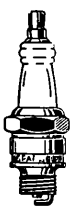
Main Nozzle (Assembly) Slip Nozzle flush type (angle tip) seats in primary venturi at 45° angle Discharge jet size .110 inch diameter Inner nozzle (seats in slip nozzle), I D No 31 (.120") drill

Metering Rod (Vacumeter Type) Economy step .0745 inch diameter Middle step tapers to .066 inch diameter Power step .048 inch diameter Length 3 9/64 inches

Metering Rod Jet .1015 inch diameter

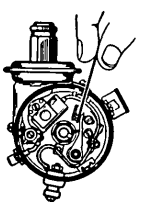
Metering Rod Setting Use gauge part No T109 102 (2.468 inches)

Accelerating Pump Pressure type
Pump discharge jet size No 72 (.025") drill
Relief passage (to outside) size No 42 (.0935") drill
Intake ball check size No 60 (.040") drill
Discharge ball check size No 32 (.116") drill



Pump Adjustment 16/64 inch plunger travel (full throttle position) Use gauge No T109 117S

Choke Carter Climatic® Control set at index Butterfly type offset valve Choke heat suction hole in body size No 30 (.1285") drill



Vacuum Spark Port (Round type) .058 .061 inch diameter Top of port .050 inch above valve

CARBURETER ADJUSTMENTS

Pump Adjustment With throttle valve seated and pump connector link in place (lower hole on 763S-763SA) pump should travel 16/64' from closed to wide open throttle position

Measure pump travel by using Universal pump travel gauge T109-117S Place base of the gauge on ridged portion of bowl cover so that projecting portion of pump gauge rests on top surface of connector link of pump shaft Hold gauge vertical

The difference between the numbers shown by index mark on gauge at wide open and closed throttle position should be 16 (16/64") Adjust by bending throttle connector rod at lower angle

Metering Rod Adjustment Correct setting of metering rod is important and must be made after pump adjustment or when leaner than standard rods are installed

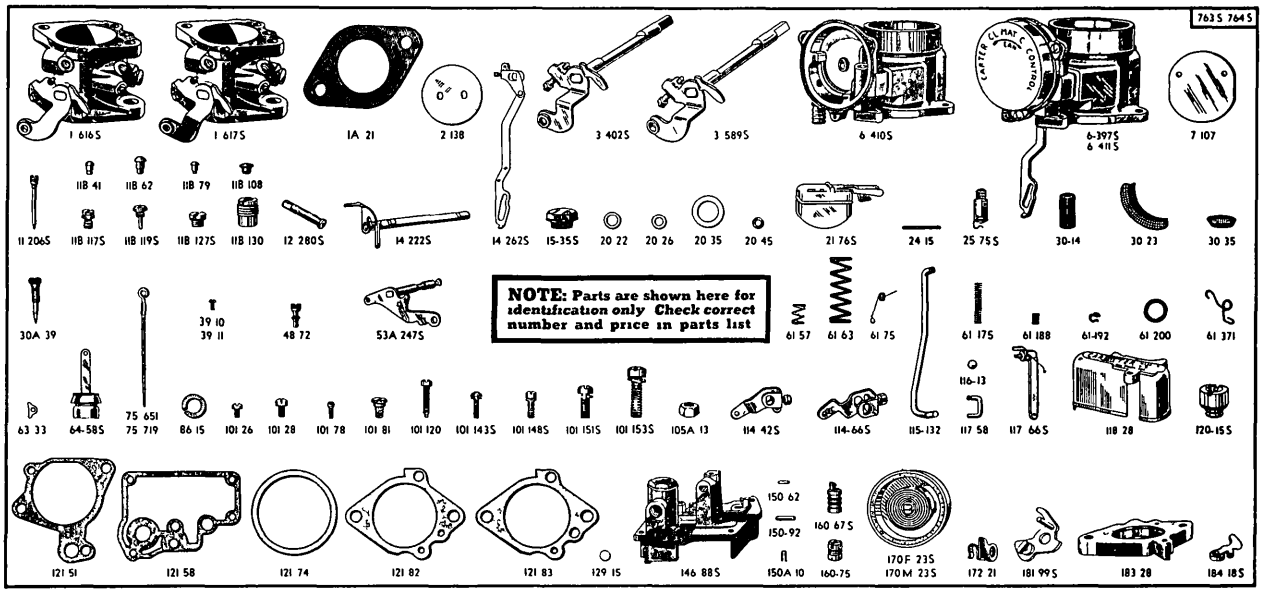
CARBURETER
TRADE MARK REG U S PAT OFF
MARCA REGISTRADA

PRINTED IN U S A



Insert gauge (tool No T109-102) in place of metering rod seating tapered end of gauge in metering rod jet Hold gauge vertical to insure seating in jet With throttle valve seated press down on piston link, directly over piston until it contacts the pump arm There should now be less than 005' clearance between metering rod pin and shoulder in notch of gauge Gauge must not drag on pin

Adjust by bending lip on piston link (use tool T109-105) Remove gauge and install metering rod, disc, pin and spring

Anti-Percolator Adjustment Crack throttle valve 020 by placing gauge T109-29 between throttle valve and bore of carbureter (side opposite idle port) Bend rocker arm (use tool T109-105) until there is a clearance of 005" to 015" between rocker arm lip and pump arm

Fast Idle Adjustment With fast idle cam in normal idle position, tighten throttle lever adjusting screw until it just seats against cam Hold throttle lever closed and pull cam back until first (or lower) step is against (not on) set screw There should now be 5/8" clearance between inside wall of air horn and lower edge of choke valve (Use tool T109-85) Adjust by bending fast idle link at offset portion (use tool T109-41)

Unloader Adjustment With throttle valve wide open there should be 3/8' (763S-763SA), 7/16" (764S) clearance between lower edge of choke valve and inner wall of air horn (T109-80 and T109-81) Adjust by bending cam on throttle lever (T109-41) Choke must be free and not drag or bend in any position

For Oldsmobile 8 Cylinder Engine 3¾ Inch Bore 3 7/16 Inch Stroke

Dimensions Flange size 1¼ inch (31 75 mm) dual 4 bolt type
Primary venturi 11/32 inch (8 73 mm) I D
Secondary venturi 21/32 inch (16 67 mm) I D
Main venturi 1 3/16 inch (30 16 mm) I D

Float Level Distance from float to bowl cover when needle is seated to be ¼ inch (6 35 mm) Use gauge No T109 31

Vents Outside none Inside balance vent forward of choke valve

Gasoline Intake Seat size No 38 (2 58 mm) drill

Low Speed Jet Tube Jet size No 70 (71 mm) drill
By pass size No 55 (1 32 mm) drill
Economizer size 0472 inch (1 2 mm) drill
Idle bleed size No 56 (1 18 mm) drill

Idle Port Upper port slot type length 190 inch (4 83 mm) Width 040 inch (1 02 mm)

Idle Port Opening 132 to 138 inch (3 35 to 3 51 mm) above upper edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw) Size 0615 to 0655 inch (1 56 to 1 66 mm) diameter

Set Idle Adjustment Screw 1 to 1½ turns open For richer mixture turn screw out Do not idle engine below 375 r p m (Hydramatic—in neutral) or 425 r p m (Syncromesh)

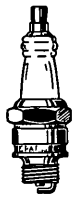
Nozzle Nozzle is installed permanently **Do not remove** Anti percolating well jet size No 60 (1 02 mm) drill

Metering Rod (Vacumeter Type) Economy step 0755 inch (1 92 mm) diameter
Middle step tapers to 066 inch (1 68 mm) diameter
Power step 048 inch (1 22 mm) diameter

Metering Rod Jet 096 inch (2 44 mm) diameter

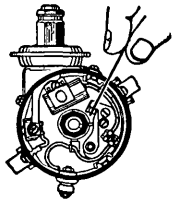
Metering Rod Setting See Adjustments

Accelerating Pump Discharge jet (twin) size No 70 (71 mm) dr ll
Pump jet air bleed to outside ⅛" (3 18 mm) diameter drill
Intake ball check Restriction (under ball check) size 100 inch (2 54 mm) diameter
D scharge (needle seat) size No 50 (1 78 mm) drill



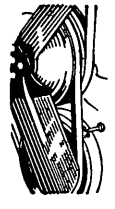
Pump Adjustment See Adjustments

Choke Carter Climatic® Control—set at index Butterfly type offset valve Choke heat suction hole in body size No 35 (2 79 mm) drill



Vacuum Spark Port 051 to 053 inch (1 30 to 1 35 mm) diam eter Top of port 021 to 031 inch (53 to 79 mm) above valve

Motor Tune-Up—Be Accurate! Always Use Feeler Gauges!



CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT (Fig. 1):

With bowl cover gasket removed, bowl cover inverted and needle seated, there should be 1/4 inch (gauge T109-31) between top of float and bowl cover.

Adjust by bending float arm.

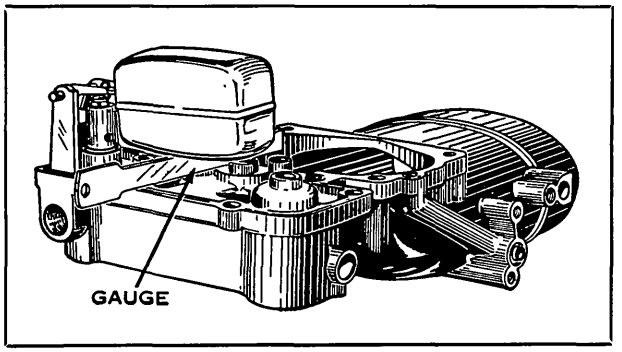

Figure 1
Float Adjustment

PUMP ADJUSTMENT (Fig. 2):

Back out throttle lever set screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel with straight edge.

Adjust by bending pump connector rod at upper angle "A".

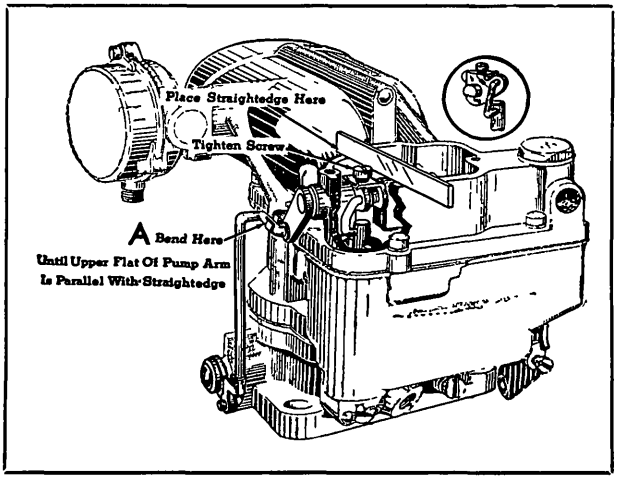

Figure 2
Pump Adjustment

METERING ROD ADJUSTMENT (Fig. 3):

The metering rods must be adjusted after the pump adjustment, or when leaner than standard rods are installed. No metering rod gauges are necessary; procedure is as follows:

With the throttle lever set screw backed out and throttle valves seated in bores of carbureter, press down on vacumeter link "B" until metering rods bottom at "C". With rods held in this position, revolve metering rod arm until lip contacts vacumeter link "D". Hold in place and carefully tighten set screw.

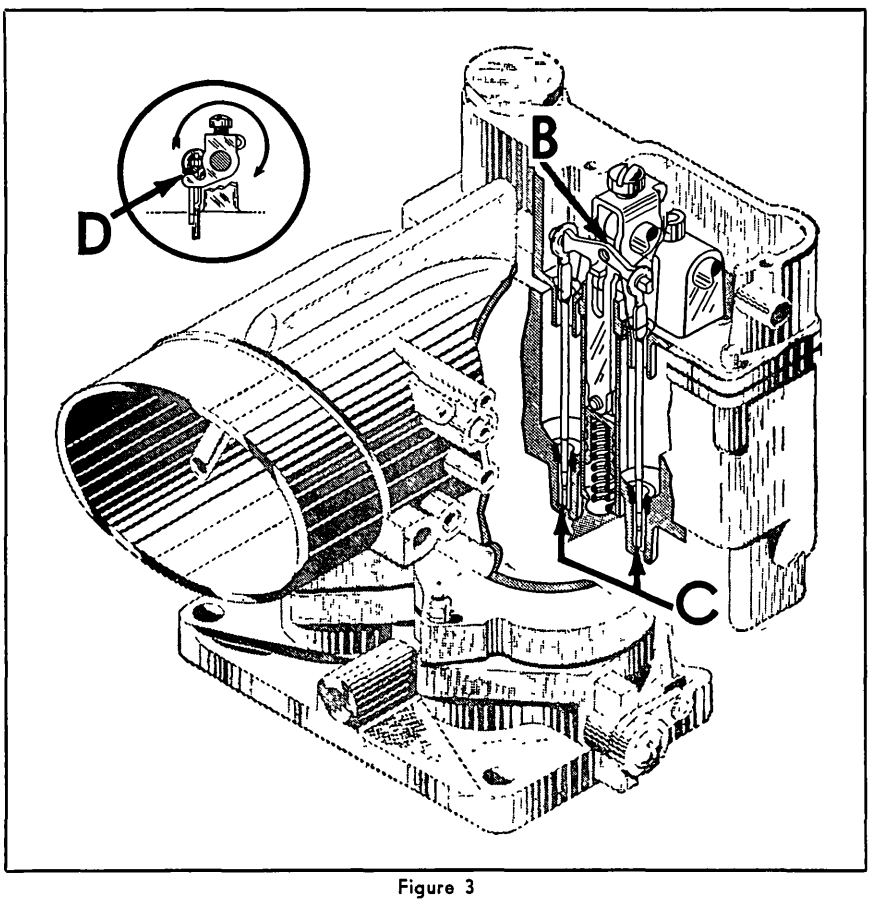

Figure 3
Metering Rod Adjustment

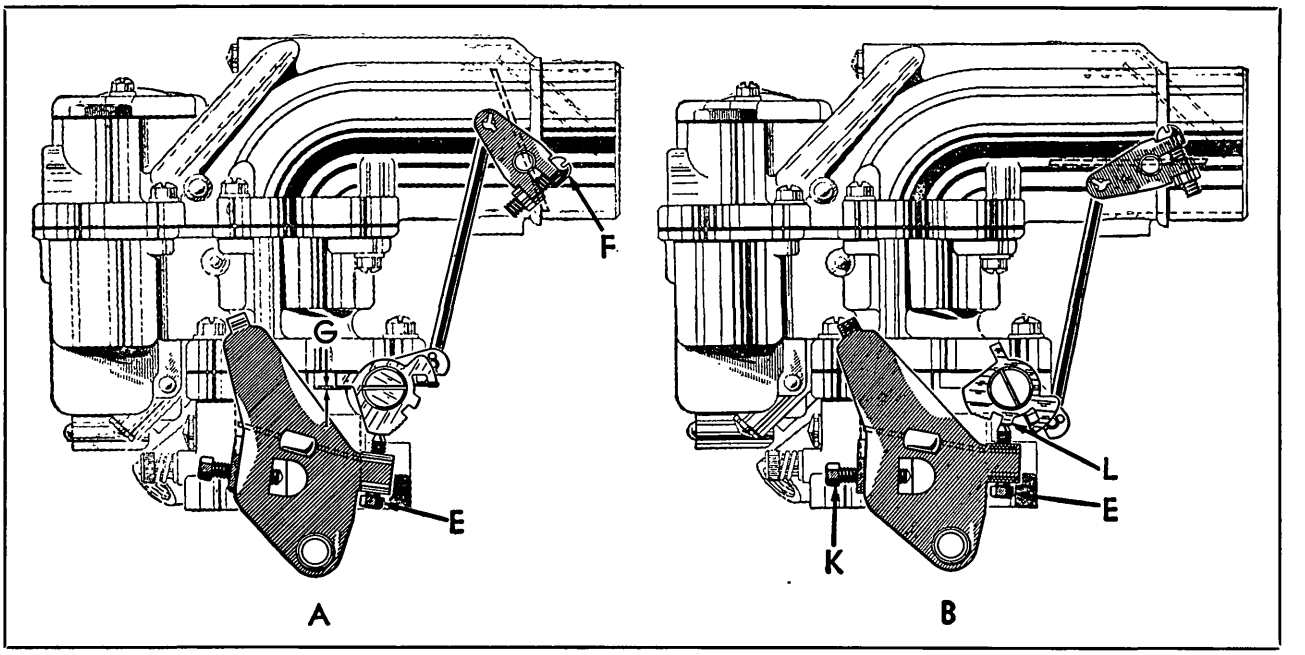

Figure 4
Fast Idle Adjustment

FAST IDLE ADJUSTMENT (Fig. 4):

A. Back out fast idle set screw "E" until fast idle cam revolves freely, then loosen choke lever clamp screw "F". Insert .015" flat feeler gauge between lip of fast idle cam and boss on flange casting "G". Hold choke valve tightly closed and take all slack out of linkage by pressing choke lever toward closed position—hold in place and tighten clamp screw "F".

B. With throttle lever set screw "K" backed out and throttle valves seated in bores of carbureter, revolve fast idle cam until raised projection "L" lines up with fast idle set screw "E". Adjust fast idle set screw "E" until it just touches raised projection "L" on fast idle cam.

UNLOADER ADJUSTMENT (Fig. 5):

With throttle valve in wide open position, there should be 7/64 inch (gauge T109-125 may be used) between lower edge of choke valve and inner wall of air horn "H". Adjust by bending lip "J" on throttle lever. Use bending tool T109-41.

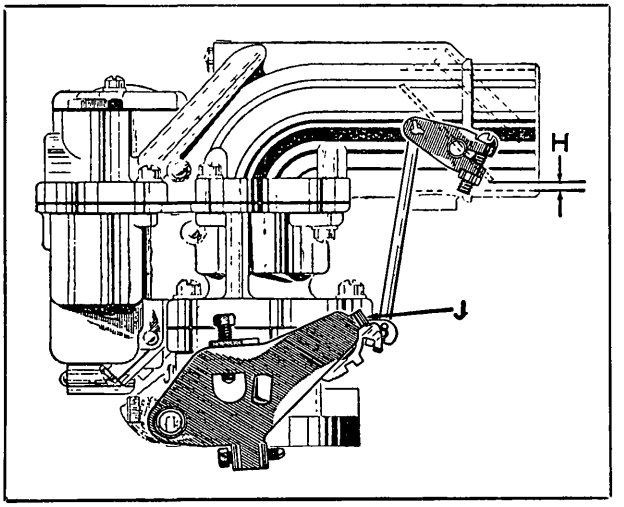

Figure 5
Unloader Adjustment

INSTALLATION UNIT:

Installation unit No. 195-43U required when installing Carter WGD 849S or 714SA carbureter on 1949 or 1950 Oldsmobile 8 cylinder Rocket engines, not originally Carter equipped. Complete installation instructions packed with each unit.

195-43U Installation Unit

(To be used when engine is not originally Carter equipped)

CARBURETER SPECIFICATIONS

For Oldsmobile 8 Cylinder Engine· 3¾ Inch Bore, 3-7/16 Inch Stroke

Dimensions: Flange size, 1¼ inch dual, 4 bolt type.
Primary venturi, 11/32 inch I D.
Secondary venturi, 21/32 inch I D.
Main venturi, 1-3/16 inch I. D.

Float Level: Distance from float to bowl cover, when needle is seated to be ¼ inch. Use gauge No. T109-31.

Vents: Outside, none. Inside balance vent, forward of choke valve.

Gasoline Intake: Square vertical (push-pull) needle. Seat size No. 38 (.1015") drill.

Low Speed Jet Tube: Jet size, No. 70 (.028") drill.
By-pass, size No. 55 (.052") drill.
Economizer, size (.0472") drill.
Idle bleed, size No. 56 (.0465") drill.

Idle Ports: Upper port, slot type, length .200 inch. Width .030 inch (early production). Length .190 inch. Width .040 inch (late production).

Idle Port Opening: .132 to .138 inch above upper edge of valve with valve closed tight.

Lower Port (For Idle Adjustment Screw): Size, .0615 to .0655 inch diameter.

Set Idle Adjustment Screw: ½ to 1 turn open. For richer mixture turn screw out. Do not idle engine above 390 r p m

Nozzle: In primary venturi, angle 45°. Flush type. Inside diameter, No. 38 drill. Nozzle is installed permanently. Do not remove. Anti-percolating well; jet size, No. 60 drill.

Metering Rod (Vacumeter Type): Economy step, 0745 inch diameter. Middle step tapers to 0655 inch diameter. Power step .042 inch diameter. Length 2-59/64 inches.

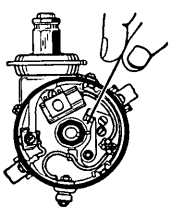
Metering Rod Jet: .096 inch diameter.

Metering Rod Setting: After adjusting for pump stroke, set metering rod as follows
With throttle tightly closed, hold metering rods (assembled on vacumeter link) in maximum down position, tighten clamp screw securely with metering rod arm contacting vacumeter link.

Accelerating Pump: Pressure type delayed action plunger (non-adjustable lever).
Discharge jet (twin) size No. 70 drill.
Pump jet air bleed to outside: ⅛" diameter drill
Intake ball check, size No. 40 (.098") drill.
Discharge (needle seat) size No. 50 (.070") drill.

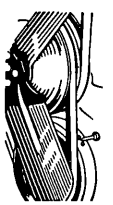
Pump Adjustment: Flat on top of pump arm should be parallel with straight edge held across top of dust cover boss

Choke: Carter Climatic® Control—set at index Butterfly type, offset valve Choke heat suction hole in body, size No. 35 (.110 inch) drill.

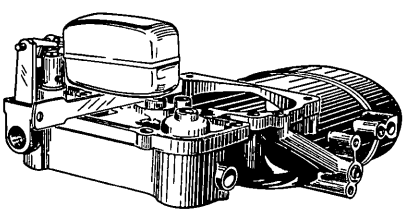


Vacuum Spark Port: 051 to 053 inch diameter. Top of port 029 to .033 inch above valve (early production), 021 to .031 inch above valve (late production).

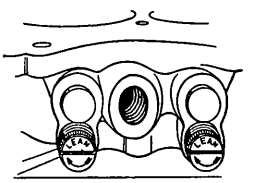
Motor Tune-Up—Be Accurate! Always Use Feeler Gauges!



CAUTION· Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter



Spark Plug Gap .030"



Breaker Point Setting .015"

Ignition Timing Breaker Points to Open: On Mark

Float Setting ¼ Inch (Use Gauge T109-31)

Idle Adjustment Screw Setting ½ to 1 Turn Open

NOTE: These cars equipped with hydraulic valve lifters.—No adjustment.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT (Fig. 1):

With bowl cover gasket removed, bowl cover inverted and needle seated, there should be 1/4 inch (gauge T109-31) between top of float and bowl cover.

Adjust by bending float arm.

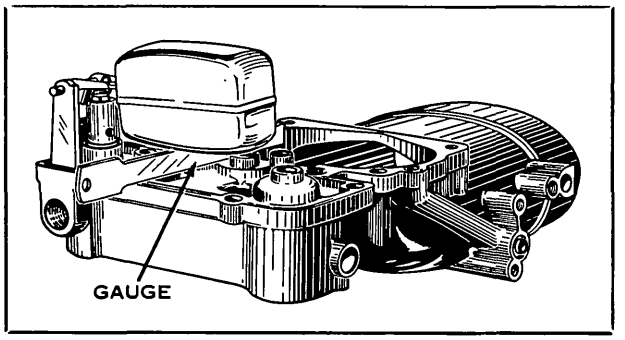

Figure 1
Float Adjustment

PUMP ADJUSTMENT (Fig. 2):

Back out throttle lever set screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel with straight edge.

Adjust by bending pump connector rod at upper angle "A".

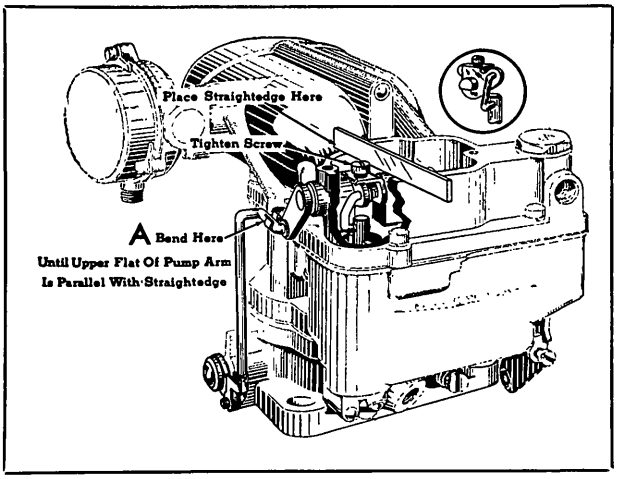

Figure 2
Pump Adjustment

METERING ROD ADJUSTMENT (Fig. 3):

The metering rods must be adjusted after the pump adjustment, or when leaner than standard rods are installed. No metering rod gauges are necessary; procedure is as follows:

With the throttle lever set screw backed out and throttle valves seated in bores of carbureter, press down on vacumeter link "B" until metering rods bottom at "C". With rods held in this position, revolve metering rod arm until lip contacts vacumeter link "D". Hold in place and carefully tighten set screw.

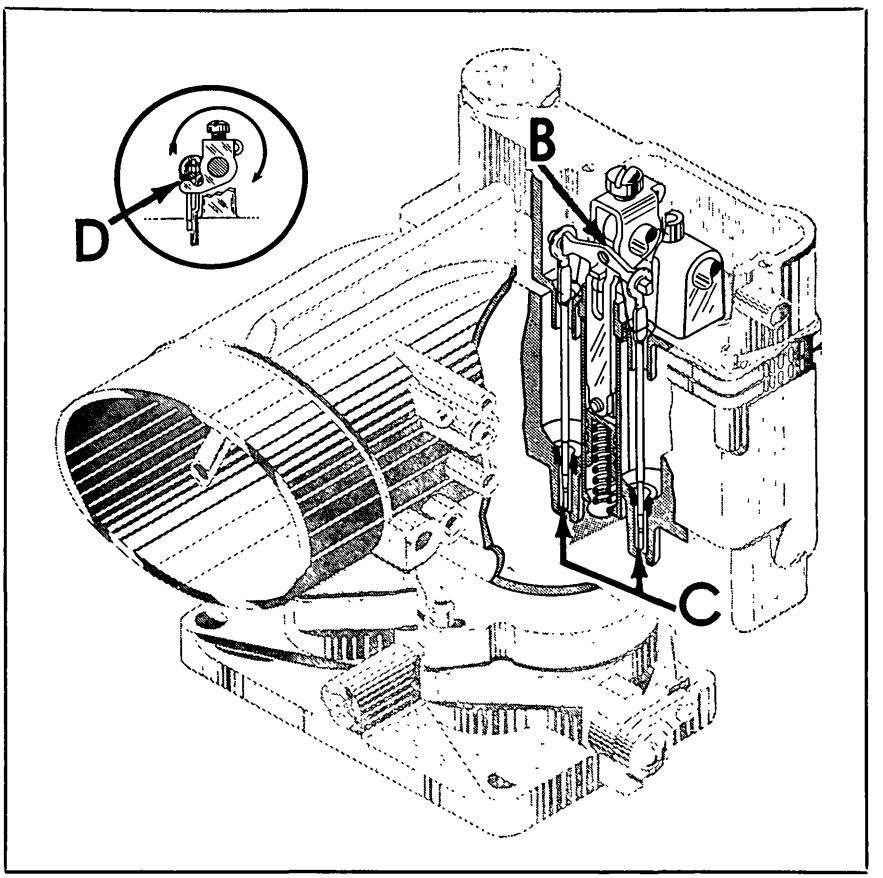

Figure 3
Metering Rod Adjustment

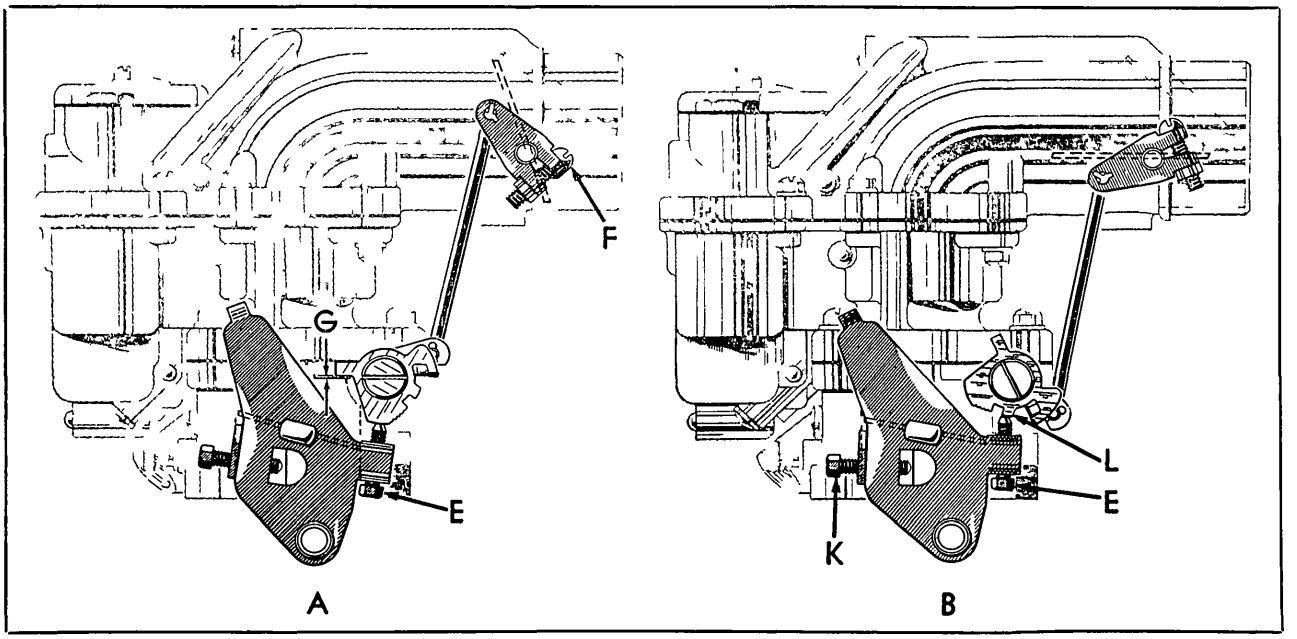

Figure 4
Fast Idle Adjustment

FAST IDLE ADJUSTMENT (Fig 4)

A Back out fast idle set screw E until fast idle cam revolves freely then loosen choke lever clamp screw F Insert 018" wire gauge (T109 44) between lip of fast idle cam and boss on flange casting G Hold choke valve tightly closed and take all slack out of linkage by pressing choke lever toward closed position—hold in place and tighten clamp screw F

B With throttle lever set screw K backed out and throttle valves seated in bores of carbureter revolve fast idle cam until raised projection L lines up with fast idle set screw E Adjust fast idle set screw E until it just touches raised projection L on fast idle cam

UNLOADER ADJUSTMENT (Fig. 5):

With throttle valve in wide open position there should be 1/4 inch (gauge T109 31) between lower edge of choke valve and inner wall of air horn H ' Adjust by bending lip "J on throttle lever Use bending tool T109 41

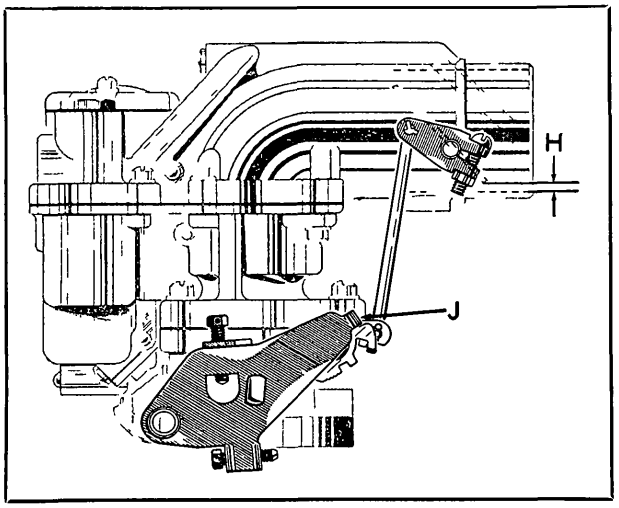

Figure 5
Unloader Adjustment

WA-1 Down-Draft **Carbureters 709S-710S** With Climatic® Control

CARBURETER SPECIFICATIONS

For Oldsmobile Six Cylinder Engine 3 17/32 Inch Bore, 4⅜ Inch Stroke

Dimensions Flange size 1½ inch S A E
Primary venturi 11/32 inch I D
Secondary venturi 11/16 inch I D
Main venturi 1⅜ inch I D

Float Level Distance from seam of float (at free end) to tip on lower edge of float chamber cover when needle is seated to be ½ inch

Vents Outside No 10 drill Inside none

Gasoline Intake Square vertical (push pull) needle Size No 46 (.081") drill hole in needle seat

Low Speed Jet Tube Jet size No 70 (.028") drill
By pass size No 53 (.0595") drill (early production)
By pass size .063 inch diameter (late production)
Economizer .063 .064 inch diameter
Idle bleed size No 52 (.0635") drill

Idle Port Length .190 inch Width, .040 inch

Idle Port Opening .136 to .140 inch above valve with valve closed tight

Idle Screw Seat No 46 drill

Set Idle Adjustment Screw ½ to 2 turns open For richer mixture turn screw out Do not attempt to idle engine below 6 m p h

Main Nozzle (Assembly) Slip Nozzle, flush type (angle tip) seats in primary venturi at 45° angle Discharge jet size .110 inch diameter Inner nozzle (seats in slip nozzle) I D No 31 (.120") drill

Nozzle Retainer Plug Size No 26 drill

Metering Rod (Vacumeter Type) Economy step .0745 inch diameter Middle step tapers to .066 inch diameter Power step .048 inch diameter Length 3 9/64 inches

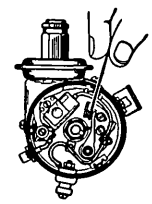
Metering Rod Jet .1015 inch diameter

Metering Rod Setting Use gauge part No T109 102 (2.468 inches)

Accelerating Pump Pressure type
Pump d scharge jet size No 72 (.025") drill
Relief passage (to outside) size No 42 (.0935") drill
Intake ball check size No 60 (.040") drill
Discharge ball check size No 32 (.116") drill

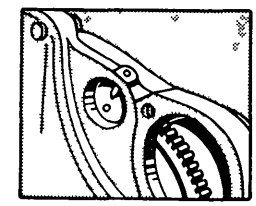
Pump Adjustment 16/64 inch plunger travel (full throttle position) Use gauge No T109 117S

Choke Carter Climatic® Control set at index Butterfly type offset valve Choke heat suction hole in body size No 30 (.1285") drill

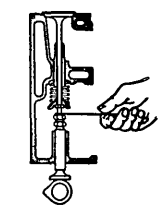


Vacuum Spark Port (Round type) .058 .061 inch diameter Top of port .050 inch above valve

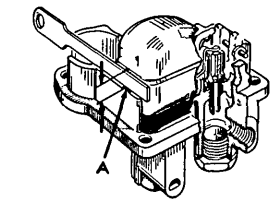
Motor Tune-Up—Be Accurate!



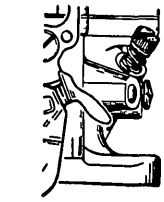
CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter



Spark Plug Gap .040"



Breaker Point Setting .020"



Ignition Timing Breaker Points to Open On Ball or 1° B T C

Valve Setting (Hot)
Intake .008"
Exhaust .011"

Float Setting ½ Inch (Measure from point 'A' to top of float seam)

Idle Adjustment Screw Setting ½ to 2 Turns Open

CARBURETER ADJUSTMENTS

Pump Adjustment With throttle valve seated, pump plunger should travel 16/64' from closed to wide open throttle position

Measure pump travel by using Universal pump travel gauge T109-117S Place base of the gauge on ridged portion of bowl cover so that projecting portion of pump gauge rests on top surface of connector link at pump shaft Hold gauge vertical The difference between the numbers shown by index mark on gauge at wide open and closed throttle position should be 16 (16/64)

Adjust by bending throttle connector rod at lower angle

Metering Rod Adjustment Correct setting of metering rod is important and must be made after pump adjustment or when leaner than standard rods are installed

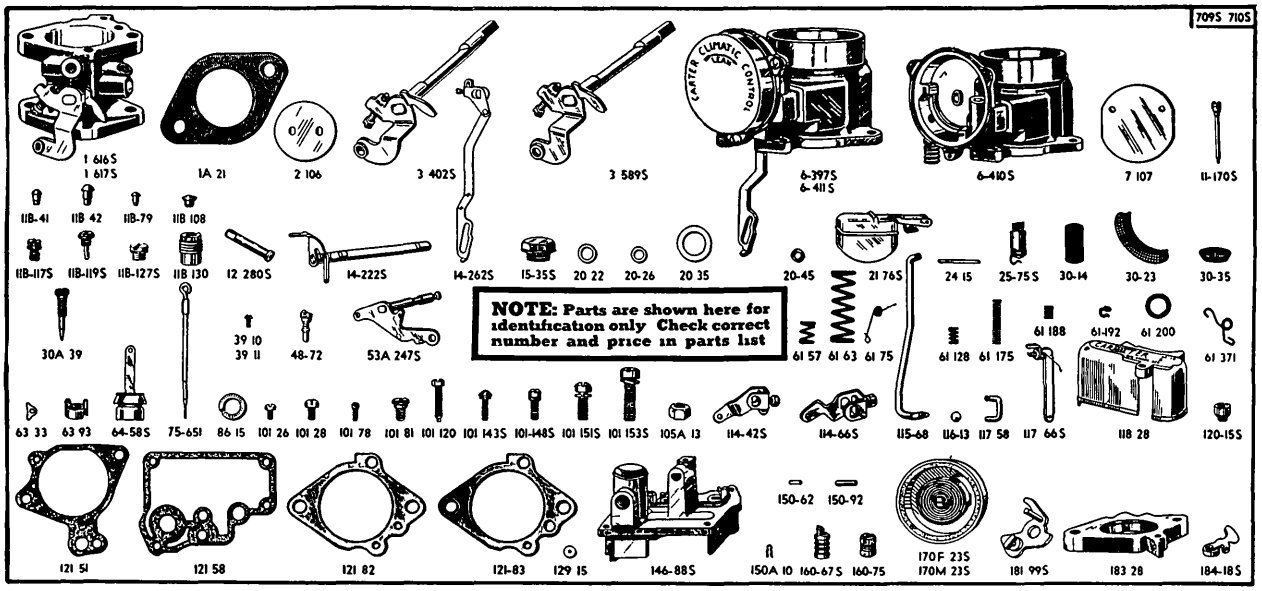
PRINTED IN U.S.A.

Insert gauge (tool No T109-102) in place of metering rod seating tapered end of gauge in metering rod jet Hold gauge vertical to insure seating in jet With throttle valve seated press down on piston link, directly over piston until it contacts the pump arm There should now be less than 005 clearance between metering rod pin and shoulder in notch of gauge Gauge must not drag on pin



Adjust by bending lip on piston link (use tool T109-105) Remove gauge and install metering rod, disc, pin and spring

Anti-Percolator Adjustment Crack throttle valve 020" by placing gauge T109-29 between throttle valve and bore of carbureter (side opposite idle port) Bend rocker arm (use tool T109-105) until there is a clearance of 005 to 015" between rocker arm lip and pump arm

Fast Idle Adjustment With fast idle cam in normal idle position tighten throttle lever adjusting screw until it just seats against cam Hold throttle lever closed and pull cam back until first (or lower) step is against (not on) set screw

There should now be 5/8' clearance between inside wall of air horn and lower edge of choke valve (Use tool T109-85) Adjust by bending fast idle link at offset portion (use tool T109-41)

Unloader Adjustment With throttle valve wide open there should be 7/16" (710S), 3/8' (709S) clearance between lower edge of choke valve and inner wall of air horn (T109 80 or T109-81) Adjust by bending cam on throttle lever (T109 41)

Oldsmobile 6—1949—Carbureter Nos. 709S-710S

WA-1 Down-Draft **Carbureter 651S** With Climatic® Control

CARBURETER SPECIFICATIONS

For Oldsmobile Six Cylinder Engine 3½ Inch Bore, 4⅛ Inch Stroke

Dimensions Flange size 1½ inch S A E
Primary venturi 11/32 inch I D
Secondary venturi 11/16 inch I D
Main venturi 1⅜ inch I D

Float Level Distance from seam of float (at free end) to tip on lower edge of float chamber cover when needle is seated to be ½ inch

Vents Outside No 10 drill Inside none

Gasoline Intake Square vertical (push pull) needle Size No 46 (081") drill hole in needle seat

Low Speed Jet Tube Jet size No 70 (028") drill
By pass size No 53 (0595") drill (early production) (063") drill (late production)
Economizer 063 064 inch diameter
Idle bleed size No 52 (0635") drill

Idle Port Length 190 inch Width 040 inch

Idle Port Opening 136 to 140 inch above valve with valve closed tight

Idle Screw Seat No 46 drill

Set Idle Adjustment Screw ½ to 1½ turns open For richer mixture turn screw out Do not attempt to idle engine below 6 m p h

Main Nozzle (Assembly) Slip Nozzle flush type (angle tip) seats in primary venturi at 45° angle Discharge jet size 110 inch diameter Inner nozzle (seats in slip nozzle) I D No 31 (120") drill

Nozzle Retainer Plug Size No 26 drill

Metering Rod (Vacumeter Type) Economy step 0745 inch diameter Middle step tapers to 066 inch diameter Power step 048 inch diameter Length 3 9/64 inches

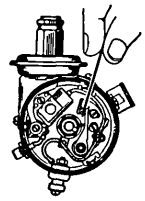
Metering Rod Jet 1015 inch diameter

Metering Rod Setting Use gauge part No T109 102 (2 468 inches)

Accelerating Pump Low pressure type
Pump discharge jet size No 72 (025") drill
Relief passage (to outside) size No 42 (0935") drill
Intake ball check size No 60 (040") drill
Discharge ball check size No 32 (116") drill

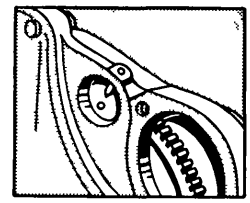
Pump Adjustment 16/64 inch plunger travel (full throttle position) Use gauge No T109-117S

Choke Carter Climatic® Control set at index Butterfly type offset valve Choke heat suction hole in body size No 30 (1285") drill

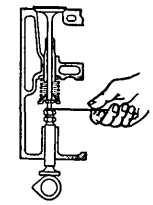


Vacuum Spark Port Slot type (round end) 040 x 100 inch Bottom of port 025 035 inch above valve

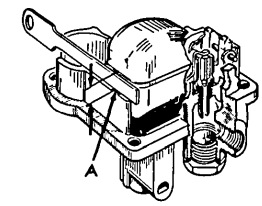
Motor Tune-Up—Be Accurate!



CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter



Spark Plug Gap 040"



Breaker Point Setting 018"-024"

Ignition Timing Breaker Points to Open On Ball 1° BTC

Valve Setting Int 008" Exh 011"

Float Setting ½ Inch (Measure from point A to top of float seam)

Idle Adjustment Screw Setting ½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

Pump Adjustment With throttle valve seated pump plunger should travel 16/64" from closed to wide open throttle position

Pump travel should be measured by using Universal pump travel gauge T109-117S Place the base of the gauge on ridged portion of bowl cover so that projecting portion of pump gauge rests on top surface of connector link at pump shaft Hold gauge vertical The difference between the numbers shown by index mark on gauge at wide open and closed throttle position should be 16 (16/64")

Adjust by bending throttle connector rod at lower angle

Metering Rod Adjustment Correct setting of metering rod is important and must be made after pump adjustment or when leaner than standard rods are installed

Insert gauge (tool No 109 102) in place of metering rod, seating tapered end of gauge in metering rod jet Hold gauge vertical to insure seating in jet With throttle valve seated press down on piston link directly over piston until it contacts the pump arm There should now be less than 005" clearance between metering rod pin and shoulder in notch of gauge Gauge must not drag on pin

Adjust by bending lip on piston link (use tool T109-105)

OLDSMOBILE EIGHT "68"-"78"-"98" 1948

Hydra-Matic Transmission

Casting No. 540 on face of flange.

WDO Dual Down-Draft Vacumeter Clim.® Cont. Carbs.—**Models 650S-650SA**

CARBURETER SPECIFICATIONS

For Oldsmobile 8 Cylinder Engine: 3¼ Inch Bore, 3⅞ Inch Stroke

Dimensions: Flange size, 1⅛ inch dual, 4 bolt type.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 21/32 inch I. D.
Main venturi, 1-3/16 inch I. D.

Float Level: Distance from float to bowl cover, when needle is seated to be 3/16 inch (650S), 15/64 inch (650SA). Use gauge No. T109-32 (15/64 inch).

Vents: Outside, No. 10 drill—four holes. Inside, none.

Gasoline Intake: Square vertical (push-pull) needle. Size No. 38 (.1015") drill hole in needle seat (650S); size No. 46 (.081") drill hole in needle seat (650SA).

Low Speed Jet Tube: Jet size, No. 71 (.026") drill.
By-pass (plug), size No. 51 (.067") drill.
Economizer, size No. 50 (.070") drill.
Idle bleed, size No. 53 (.0595") drill.

Idle Ports: Upper port, slot type, length .200 inch. Width .030 inch.

Idle Port Opening: .144 to .150 inch above upper edge of valve with valve closed tight.

Lower Port (For Idle Adjustment Screw): Size, .0615 to .0655 inch diameter.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture turn screw out. Do not idle engine above 375 R.P.M. on Hydra-Matic cars. (Use Tachometer.)

Main Nozzle: Slip Nozzle, flush type (angle tip) seats in primary venturi, at 45° angle. Discharge jet size, .110 inch diameter.
Inner Nozzle (seats in slip nozzle). No. 31 (.120") drill I. D.

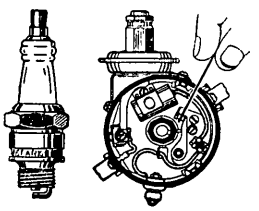
Nozzle Retainer Plug: Jet size, No. 51 (.067") drill (early production); No. 50 (.070") drill (later production).

Metering Rod (Vacumeter Type): Economy step, .071 inch diameter. Middle step tapers to .061 inch diameter. Power step, .050 inch diameter. Length 2-59/64 inches.

Metering Rod Jet: .089 inch diameter.

Metering Rod Setting: Use gauge, part No. T109-113 (2.280 inches).

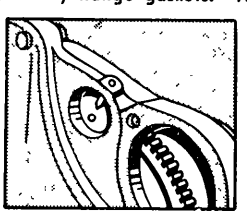
Accelerating Pump: High pressure type (spring operated lever).
Discharge jet (twin) size, No. 72 drill.
Relief passage (slots) to air horn.
Intake ball check, size No. 40 (.098") drill.
Discharge (needle seat) size, No. 50 (.070") drill.



Pump Adjustment: 19/64 inch plunger travel (full throttle position). Use gauge No. T109-117S.

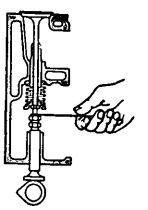
Choke: Carter Climatic® Control—set 2 points rich. Butterfly type, offset valve. Choke heat suction hole in body, size No. 38 (.1015 inch) drill.

Vacuum Spark Port: .039-.041 inch diameter. Top of port .029-.033 inch above valve.

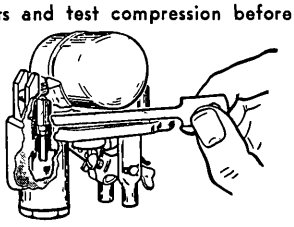


Motor Tune-Up—Be Accurate!

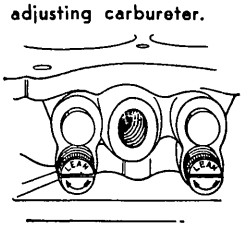
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .030"



Breaker Point Setting .012"-.018"



Ignition Timing Breaker Points to Open: On Ball 1° B.T.C.

Valve Setting Intake .008" Exhaust .011"

Float Setting 3/16" (650S) 15/64" (650SA) (Use Gauge T109-32)

Idle Adjustment Screw Setting ½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

PUMP ADJUSTMENT: With pump connector link in place in pump arm, throttle adjusting screw backed out and throttle in closed position, pump plunger should travel 19/64" from closed to wide open throttle position. Pump travel can be measured by using Universal pump travel gauge T109-117S. Place gauge on raised portion of bowl cover around the plunger shaft. Projecting portion in indicator should be placed on top of connector link where it extends through the plunger shaft. The difference in reading between closed and wide open throttle position should be "19" (19/64") plunger travel.

Adjust by bending throttle connector rod at lower angle.

METERING ROD ADJUSTMENT: Must be made when reassembling carbureter or when leaner than standard metering rods are installed. Do not disturb pump adjustment. Procedure is as follows:

(a) Back out throttle lever adjustment screw until throttle valves seat. Insert one metering rod gauge T109-113 in place of metering rod. Be sure gauge seats in jet.

(b) Install metering rod pin and pin spring in vacuum piston and link assembly.

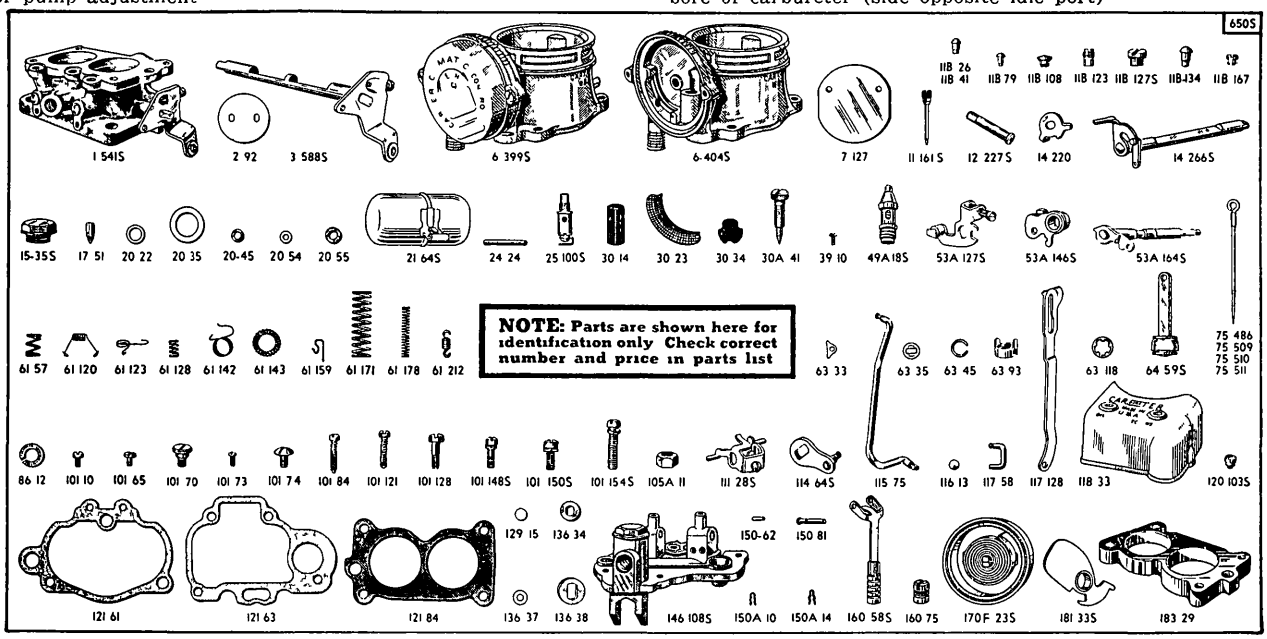
MARCA REGISTRADA

PRINTED IN U.S.A.



(c) Press lightly on top of vacuum piston link until lip contacts tongue on anti-percolator arm There should now be less than .005" clearance between metering rod pin and shoulder in notch of gauge with throttle valves seated

Adjust by bending tongue on pump arm Remove gauge and metering rod pin and install metering rods, discs spring, and metering rod pin, and hook spring to metering rod Vacuum piston and link must not bind or drag in any position

ANTI-PERCOLATOR ADJUSTMENT: Anti-percolator should be checked after metering rod setting and installation of metering rod on carbureter Do not disturb metering rod or pump adjustment With throttle valve seated in bores of carbureter, adjust lips of anti-percolator arm until center of indicator line is just flush with top of anti-percolator plug Since there are two anti-percolators on this carbureter, great care must be taken so that an even adjustment is made on both lips.

UNLOADER ADJUSTMENT. With throttle wide open, distance between upper edge of choke valve and wall of air horn should be ¼" Use gauge No T109-31 Adjustment should be made by bending lip on fast idle connector link Adjust with choke in wide open position

FAST IDLE ADJUSTMENT: Hold choke valve tightly closed and adjust fast idle cam screw, on high step of cam, until there is .015' opening between edge of throttle valve and bore of carbureter (side opposite idle port)

Oldsmobile 8—1948—Carbureter Nos. 650S-650SA

Casting No. 340 on Face of Flange

WA-1 Down-Draft **Carbureters 481S-504S** With Climatic® Control

CARBURETER SPECIFICATIONS

For Oldsmobile Six Cylinder Engine: 3½ Inch Bore, 4⅛ Inch Stroke

Dimensions: Flange size, 1½ inch S. A. E.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 11/16 inch I. D
Main venturi, 1⅜ inch I. D.

Float Level: Distance from seam of float (at free end) to tip on lower edge of float chamber cover, when needle is seated to be ½ inch

Vents: Outside, No 10 drill. Inside none

Gasoline Intake: Square vertical (push-pull) needle Size No 46 drill hole in needle seat

Low Speed Jet Tube: Jet size, No 70 drill
By-pass, size No. 53 (.0595") drill (early production), 1.6 mm (.063") drill (late production)
Economizer, .063-.064 inch diameter
Idle bleed, size No. 52 drill.

Idle Port: Length, .190 inch. Width, .040 inch

Idle Port Opening: 136 to .140 inch above valve with valve closed tight

Idle Screw Seat: No. 46 drill

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture, turn screw out Do not attempt to idle engine below 6 m p h

Main Nozzle (Assembly): Slip Nozzle, flush type (angle tip) seats in primary venturi, at 45° angle. Discharge jet size .110 inch diameter Inner nozzle (seats in slip nozzle). I. D No 31 drill

Nozzle Retainer Plug Size No 26 drill

Metering Rod (Vacumeter Type): Economy step, .0745 inch diameter Middle step tapers to 066 inch diameter. Power step, 048 inch diameter. Length 3-9/64 inches

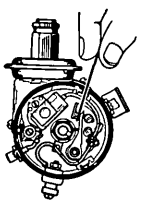
Metering Rod Jet: 1015 inch diameter.

Metering Rod Setting: Use gauge, part No T109-102 (2.468 inches)

Accelerating Pump: Low pressure type.
Pump discharge jet, size No. 72 drill
Relief passage (to outside), size No 42 drill
Intake ball check size, No 60 drill
Discharge ball check size, No 32 drill.

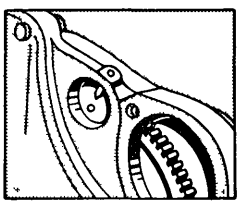
Pump Adjustment: 16/64 inch plunger travel (full throttle position) medium stroke Use gauge No T109-117S

Choke: Carter Climatic® Control set at index Butterfly type, offset valve Choke heat suction hole in body size No 30 (.128") drill

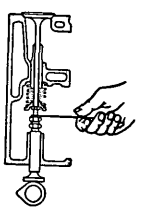


Vacuum Spark Port: Slot type (round end) .040 x .100 inch
Bottom of port .030-.035 inch above valve (early production)
Bottom of port .025-.035 inch above valve (late production).

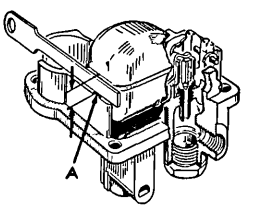
Motor Tune-Up—Be Accurate!



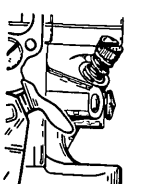
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter



Spark Plug Gap .040"



Breaker Point Setting .018"-.024"



Ignition Timing Breaker Points to Open at T. D. C.

Valve Setting
Intake .008"
Exhaust .011"

Float Setting ½ Inch (Measure from point "A" to top of float seam)

Idle Adjustment Screw Setting ½ to 1½ Turns Open

BRIEF CARBURETER ADJUSTMENTS

Pump Adustment: With throttle valve seated and connector link in lower hole (medium stroke), pump plunger should travel 16/64 inch from closed to wide open throttle position (Later models have only one hole in pump arm.) Pump travel can be measured by Universal pump stroke gauge T109-117S by placing the base of gauge on ridged portion of bowl cover so that projecting portion of pump gauge rests on top surface of connector link at pump shaft Hold gauge vertical The difference between the number shown by index mark on gauge, at wide open and closed position, should be "16" (16/64"). Adjustment should be made by bending throttle connector rod at lower angle

Metering Rod Adjustment: Correct setting of metering rod is important and must be made after pump adjustment Insert gauge (tool No T109-102) in place of metering rod.

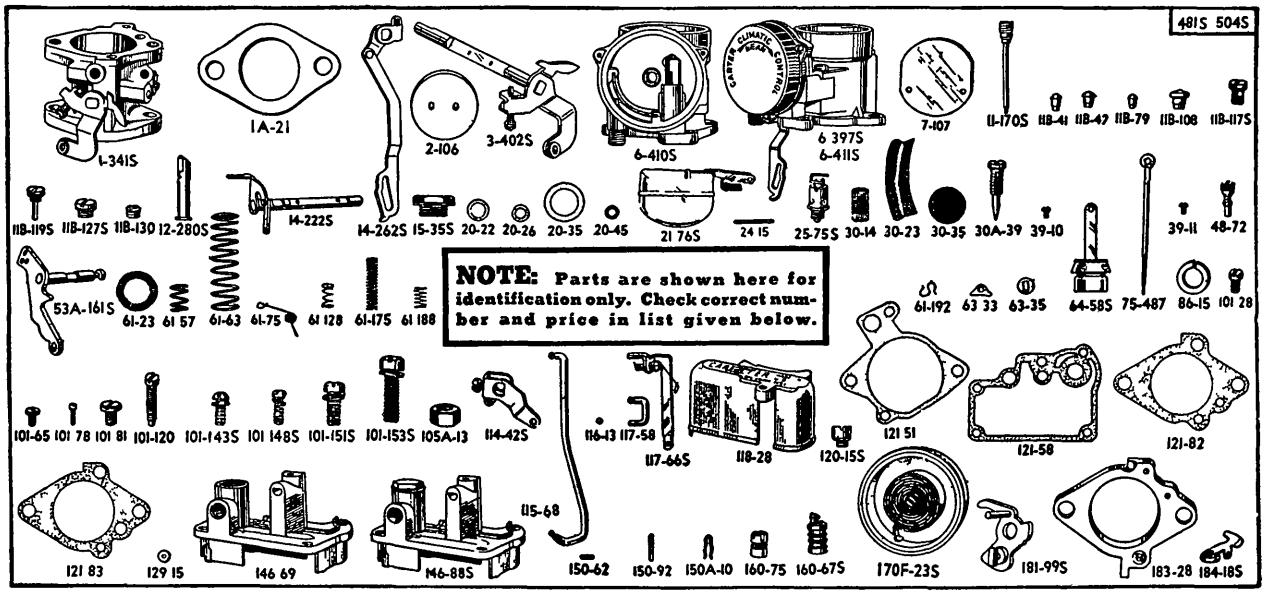
CARBURETER
TRADE MARK REG U S PAT. FF.
MARCA REGISTRADA

PRINTED IN U.S.A.



seating tapered end in metering rod jet Hold gauge vertical to insure seating in jet With throttle valve seated press down on piston link directly over piston until it contacts the pump arm There should now be less than 005' clearance between metering rod pin and shoulder in notch of gauge Gauge must not drag on pin Adjustment can be made by bending lip on piston link (use tool T109-105) Remove gauge and install metering rod, disc, pin and spring

Anti-Percolator Adjustment Crack throttle valve 020" by placing gauge T109-29 between valve and bore of carbureter (Side opposite port) Bend rocker arm (use tool T109-105) until there is a clearance of 005" to 015" between rocker arm and pump arm

Fast Idle Adjustment With fast idle cam held in normal idle position tighten throttle lever adjusting screw until it just seats against cam Hold throttle lever closed and pull cam back until first (or lower) step on cam is against (not on) set screw

There should now be 5/8" clearance between inside wall of air horn and lower edge of choke valve (Use tool T109-85) Adjustment can be made by bending at offset portion of fast idle link (Use tool T109-41)

Unloader Adjustment With throttle valve wide open there should be 3/8" clearance between lower edge of choke valve and inner wall of air horn on 481S and 7/16" on 504S-508S (Use tool T109-80 or T109-81) Adjustment should be made by bending cam on throttle lever (Use tool T109-41)

CARBURETER SPECIFICATIONS

For Oldsmobile 8 Cylinder Engine 3¼ Inch Bore 3⅞ Inch Stroke

Dimensions Flange size 1⅛ inch dual 4 bolt type
Primary venturi 11/32 inch I D
Secondary venturi 21/32 inch I D
Main venturi 1 3/16 inch I D

Float Level Distance from float to bowl cover when needle is seated to be 3/16 inch (25 100S) 15/64 inch (25 164S) (Use gauges Nos T109 28 and T109 32)

Vents Outside No 10 drill—four holes Inside none

Gasoline Intake Square vertical (push pull) needle Size No 38 drill hole in needle seat (25 100S) No 46 drill hole in needle seat (25 164S)

Low Speed Jet Tube Jet size No 71 drill
By pass (plug) size No 51 drill
Economizer size No 50 drill
Idle bleed size No 53 drill

Idle Ports Upper port slot type length 200 inch Width 030 inch

Idle Port Opening 144 to 150 inch above upper edge of valve with valve closed tight

Lower Port (For Idle Adjustment Screw) Size 0615 to 0655 inch diameter

Set Idle Adjustment Screw ½ to 1½ turns open For richer mixture turn screw out Do not idle engine above 375 R P M on Hydra Matic cars or below 425 R P M on Syncro Mesh cars (Use Tachometer)

Main Nozzle
Slip Nozzle flush type (angle tip) seats in primary venturi at 45° angle Discharge jet size 110 inch diameter
Inner Nozzle (seats in slip nozzle) No 31 drill I D

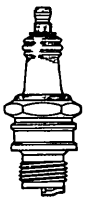
Nozzle Retainer Plug Jet size No 51 (067 inch) drill (early production) No 50 (070 inch) drill (later production)

Metering Rod (Vacumeter Type) Economy step 071 inch diameter Middle step tapers to 061 inch diameter Power step 050 inch diameter
Length 2 59/64 inches

Metering Rod Jet 089 inch diameter

Metering Rod Setting Use gauge part No T109 113 (2 280 inches)

Accelerating Pump High pressure type (spring operated lever)
Discharge jet (twin) size No 72 drill
Relief passage (slots) to air horn
Intake ball check size No 40 drill
Discharge (needle seat) size No 50 drill



Pump Adjustment 19/64 inch plunger travel (full throttle position) Use gauge No T109 117S

Choke Carter Climatic® Control—480S SA set 2 points rich, 503S SA set at index Butterfly type offset valve Choke heat suction hole in body size No 38 (1015 inch) drill

BRIEF CARBURETER ADJUSTMENTS

PUMP ADJUSTMENT With pump connector link in place in pump arm throttle adjustment screw backed out and throttle held in closed position pump plunger should travel 19/64 from closed to wide open position Adjustment can be made by bending throttle connector rod at lower angle (Use tool T109 75) Pump travel can be measured by using gauge T109 117S Bar on gauge indicator should be placed on top surface of pump shaft

METERING ROD ADJUSTMENT should be made when re assembling carbureter or when leaner than standard rods are installed (Do not disturb pump adjustment) Correct setting of metering rods is important Procedure is as follows

A Remove air horn and climatic control assembly
B Back out throttle lever adjusting screw so that throttle valves seat in throttle bore
C Remove pin spring from metering rod pin and slide the pin from vacuum piston link taking care that metering rod spring is not bent Remove metering rods and disks
D Insert one metering rod gauge tool No T109 113 in place of metering rod seating tapered end in metering rod jet Put metering rod pin in place in piston link
E Push piston link down until metering rod pin rests lightly on shoulder of notch in gauge
F With throttle valves seated and piston link held down bend lip on anti percolator arm which extends under metering rod pin so that lip just touches lip on vacumeter piston and link assembly (Use tool T109-105)
G Remove gauge and replace metering rod disks retainer and screw Install metering rods and pin spring and connect metering rod spring

ANTI PERCOLATOR ADJUSTMENT Anti percolator should be checked after metering rod setting and installation of metering rod on carbureter Do not disturb metering rod or pump adjustment

Back out throttle lever set screw until throttle valves seat in bores of carbureter With throttle valves tightly closed adjust lips of anti-percolator arm until center of indicated line is just flushed with top of anti-percolator plug Since there are two anti-percolator units on this carbureter great care must be taken so that an even adjustment is made on both lips

UNLOADER ADJUSTMENT With throttle wide open distance between upper edge of choke valve and wall of air horn should be ¼ inch If 14-219 is used set for 3/16 inch Use gauge No T109-28 for 3/16 inch or T109-31 for ¼ inch Adjustment can be made by bending lip on fast idle connector link

FAST IDLE ADJUSTMENT Hold choke valve tightly closed and adjust fast idle arm screw to give 015 inch opening between edge of throttle valve and bore of carbureter side opposite port

Oldsmobile 8—1941-1942-1946-1947—Carbureter Nos. 480S-480SA-503S-503SA

(High Compression)

UT UPDRAFT **CARBURETERS Nos. 923S-2257S**

CARBURETER SPECIFICATIONS

For Oliver Tractor 4 and 6 Cylinder Engines: 3-5/16 Inch Bore, 3¾ Inch Stroke (923S)
For Oliver Tractor 4 Cylinder Engine: 3½ Inch Bore, 3¾ Inch Stroke (2257S)

Dimensions: Flange size, 1 inch S. A. E.
Throttle bore, (923S) 1-1/16 inch.
Throttle bore, (2257S) 1-3/16 inch.
Main venturi (923S) 23/32 inch.
Main venturi (2257S) 13/16 inch.

Float Setting: See Adjustments.

Vents: Outside, none. Inside, balance vent (923S(1), (2257S(2).

Gasoline Intake Needle: Square vertical needle. Size, (923S) No. 48 (.076 inch), (2257S) No. 50 (.070 inch) drill.

Idle Jet: Jet (923S) tube size .0276 inch diameter. (2257S) - plug size No. 70 (.028 inch) drill.
Lower bleed: (923S) size No. 60 (.040 inch), (2257S) size No. 61 (.039 inch) drill. Upper bleed: size No. 65 (.035 inch) drill. Economizer: No. 61 (.039 inch) drill.

Idle Port: Lower port, slot type, round end length .049 to .051 inch, width .029 to .031 inch.
Bottom of port (923S) .044 to .048 inch, (2257S) .054 to .058 inch below lower edge of valve with valve tightly closed.

Upper Port: (For Idle Adjustment Screw): Size .038 to .042 inch diameter.

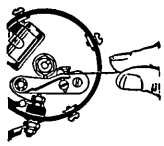
Set Idle Adjustment Screw: ¼ to 1½ turns open. For richer mixture turn screw out. Do not idle engine below 350 r.p.m.

Main Metering Jet: Adjustable. See Adjustments.

Nozzle: Inside diameter (923S) No. 46 (.081 inch) drill (2257S) No. 38 (.1015 inch) drill.
Accelerating Jets: 4 No. 64 (.036 inch) drill.

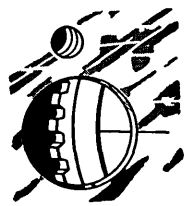
Air Bleed to Nozzle: (Through plug) (923S) No. 55 (.052 inch) (2257S) No. 58 (.042 inch) drill.

Choke: Manual—Butterfly type, with pressure relief (poppet) valve.



Vacuum Spark: NONE.

Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

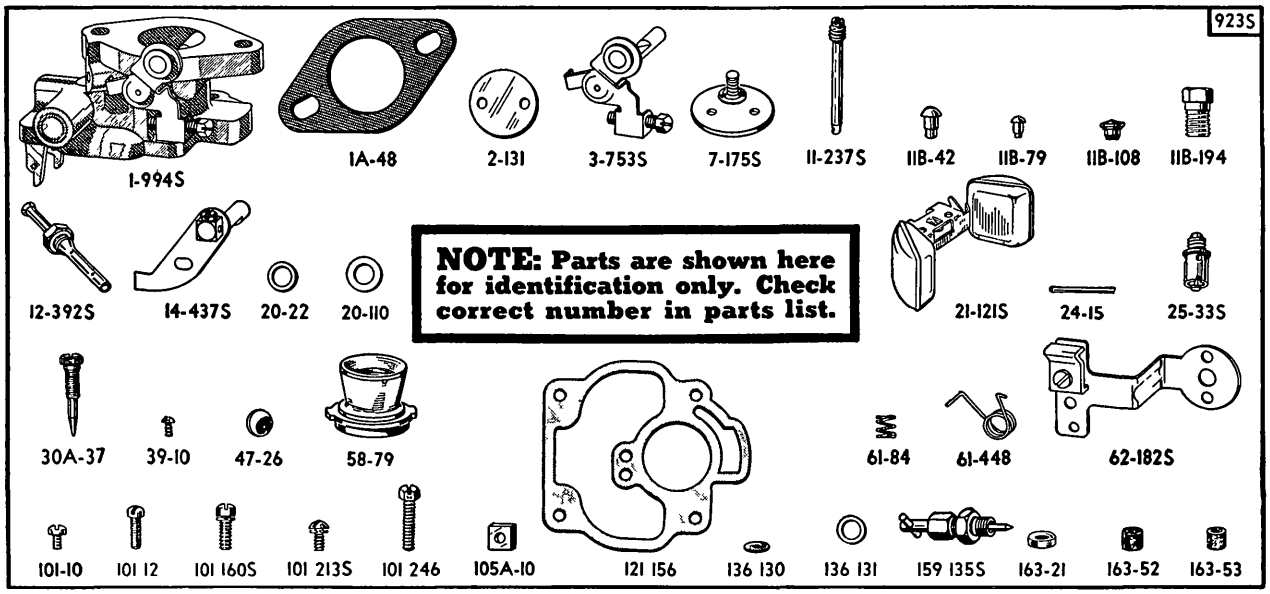
CARBURETER ADJUSTMENTS



Float Adjustment With throttle body inverted and gasket removed there should be 17/64 inch clearance (plus or minus 1/64 inch) between machined surface of throttle body and seam of float (both sides) To adjust bend lip on float lever

Idle Adjustment Set throttle lever adjusting screw until motor runs approximately 350 r p m Then set idle adjustment screw for highest steady vacuum gauge reading or smoothest engine operation Correct setting will be found between ¼ to 1½ turns open

High Speed Adjustment With hand throttle wide open and engine operating at (923S) 1750 (2257S) 2200 r p m (maximum governed speed), adjust high speed adjusting needle until smoothest engine operation is obtained This setting will be found between (923S) ¾ to 1¾ (2257S) 1½ to 2½ turns open

Maximum Performance can be secured only when breaker points spark plugs valves and motor timing are set to manufacturer s specifications

If carbureter does not respond to the above adjustments, disassemble clean all parts in carbureter cleaner rinse and blow out all passages with compressed air Replace all worn or damaged parts Always use new gaskets See form No 3525 for complete overhaul procedure

Idle Port: Slot type, length .080 inch Width .030 inch

Idle Port Opening: Bottom of port to be .010 to .014 inch above upper edge of valve with valve tightly closed.

Idle Screw Seat: Size .0465 inch diameter

Set Idle Adjustment Screw: 1/2 to 3 1/4 turns open For richer mixture turn screw out

Main Nozzle: Accelerating jets (in side of nozzle), 2 size No. 62 (.038 inch) drill Nozzle passage (nozzle well to air horn) size No. 32 (.116 inch) drill

High Speed Adjusting Needle: Seat (in base of nozzle), size .040 inch diameter Setting, see adjustments

Choke: (N-2464S) Butterfly type Choke shaft extended and slotted for automatic choke thermostatic coil
(N 2463S) Manual—Butterfly type

Spark Plug Gap .025"	Breaker Point Setting .022"	Ignition Timing Breaker Points to Open: 19° B. T. C. At 1800 R.P.M.	Valve Setting (Cold) Int. .016" Exh. .016"	Float Setting 11/64" (Plus or Minus 1/32")	High Speed Adj. Screw Setting 2 to 3 Turns Open	Idle Adjustment Screw Setting 1/2 to 3 Turns Open

SERVICE PROCEDURE

To Disassemble

1. Remove carbureter from engine.
2. Remove choke thermostatic coil (note position for reassembling). (N-2464S)
3. Remove bowl nut, gasket and bowl.
4. Remove float pin, float, needle and needle seat. Check float for dents, leaks, and wear on float lip or in float pin holes.
5. Remove bowl ring gasket
6. Remove low speed jet and high speed adjusting needle assembly and spring
7. Remove idle adjustment screw and spring
8. Nozzle installed permanently DO NOT REMOVE
9. Remove throttle valve screws valve, shaft and lever.
10. Remove choke valve screws, valve assembly and shaft
11. Clean all parts in clean solvent making sure all carbon accumulation is removed from bore, especially where throttle valve seats in casting Blow out all passages with compressed air Replace all worn or damaged parts Always use new gaskets

To Assemble

12. Install throttle shaft and valve Valve must be installed with trademark "c" on side toward idle port when viewing from flange side Always use new screws With valve screws loose and throttle lever set screw backed out, seat valve by tapping lightly with a small screw driver Hold valve in place while tightening screws
13. Install choke shaft and valve Always use new screws With valve screws loose, seat valve by tapping lightly with a small screw driver Hold in place while tightening screws
14. Install needle seat, needle, float and float pin
15. Set float level. With carbureter casting inverted, float resting lightly against needle in its seat, there should be 11/64 inch clearance between outer edge of casting and free end of float (side opposite needle seat) Adjust by bending lip of float with small screw driver
16. Install bowl ring gasket, bowl and bowl nut and gasket assembly. Tighten securely after making sure bowl is centered in gasket
17. Install low speed jet and high speed adjusting needle assembly Turn in until it seats in nozzle, then back out 2 turns
18. Then install idle adjusting screw finger tight Back out approximately 2 turns DO NOT USE PLIERS OR SCREW DRIVER AS IT MAY DAMAGE IDLE SCREW.
19. (N-2464S) Install thermostatic coil making certain that it is in the same position as it was before disassembly

HIGH SPEED AND IDLE SCREW ADJUSTMENT N-2463S, N-2464S

After rebuilding and installation on engine is complete the high speed and idle screw adjustments must be made With the high speed adjusting needle turned counter clockwise (from closed position) 2 turns and idle screw turned 2 turns open, start engine

With the engine at normal operating temperature, accelerate engine and check response The high speed adjusting needle should be adjusted for leanest possible mixture which will allow satisfactory acceleration and steady governor operation If the engine misses and backfires the high speed mixture is too lean and the high speed adjusting needle must be turned counter clockwise 1/4 turn at a time to correct this condition If the engine loads (heavy exhaust) and is sluggish, the mixture is too rich and the high speed adjusting needle must be turned clock wise 1/4 turn at a time to correct To make final check of the high speed adjustment operate the engine under load and adjust

Set idle adjustment screw from 1/2 to 3 turns open **DO NOT USE FORCE ON THE HIGH SPEED NEEDLE OR IDLE SCREW AS DAMAGE MAY RESULT.**

14 (N 2270S N 2271S) Install nozzle making sure it seats in casting

15 Install needle seat needle float and float pin

16 Set float level With carbureter casting inverted float resting lightly against needle in its seat there should be (N 2270S N 2271S) 11/64 inch (N 2460S N 2461S) 13/64 inch clearance between outer edge of casting and free end of float (side opposite needle seat) Adjust by bending lip of float with small screw driver

17 Install bowl ring gasket bowl and bowl nut and gasket assembly Tighten securely after making sure bowl is centered in gasket

18 Install low speed jet and high speed adjusting needle assembly Turn in until it seats in nozzle then back out 2 turns

19 Then install idle adjusting screw finger tight Back out approximately 2 turns DO NOT USE PLIERS OR SCREW DRIVER AS IT MAY DAMAGE IDLE SCREW

20 (N 2271S N 2461S) Install thermostatic coil making certain that it is in the same position as it was before disassembly

HIGH SPEED AND IDLE SCREW ADJUSTMENT

After rebuilding and installation on engine is complete the high speed and idle screw adjustments must be made With the high speed adjusting needle turned counter clockwise (from closed position) 2 turns and idle screw turned 2 turns open start engine

With the engine at normal operating temperature accelerate engine and check response The high speed adjusting needle should be adjusted for leanest possible mixture which will allow satisfactory acceleration and steady governor operation If the engine misses and backfires the high speed mixture is too lean and the high speed adjusting needle must be turned counter clockwise 1/4 turn at a time to correct this condition If the engine loads (heavy exhaust) and is sluggish the mixture is too rich and the high speed adjusting needle must be turned clockwise 1/4 turn at a time to correct To make final check of the high speed adjustment operate the engine under load and adjust

Set idle adjustment screw from one to three turns open DO NOT USE FORCE ON THE HIGH SPEED NEEDLE OR IDLE SCREW AS DAMAGE MAY RESULT

Model
15HQ-3/1A
Generating Unit

ONAN MOTOR GENERATOR 1953

UT UPDRAFT CARBURETER No. 2054S

CARBURETER SPECIFICATIONS

For Onan 4 Cylinder Engine: 3-7/16 Inch Bore, 4⅜ Inch Stroke

Dimensions: Flange size, 1 inch S.A.E.
Throttle bore, 1-3/16 inch.
Main venturi, ¾ inch.

Float Setting: See adjustments.

Vents: Outside, none. Inside, balance vent, in air horn ahead of choke valve, size No. 12 (.189 inch) drill.

Gasoline Intake: Size No. 55 (.052 inch) drill in needle seat.

Idle Jet Tube: Jet, size No. 66 (.033 inch) drill.

Lower bleed, size No. 60 (.040 inch) drill.
Upper bleed, size No. 65 (.035 inch) drill.
Economizer, size No. 61 (.039 inch) drill.

Idle Port: Lower port, slot type, round end, length .050: Width .030.

Idle Port Opening: Bottom of port to be .044 to .048 inch below lower edge of valve with valve tightly closed.

Upper Port (For Idle Adjustment Screw): Size .038 to .042 inch diameter.

Set Idle Adjustment Screw: ¼ to 1 turn open. For richer mixture turn screw out.

Main Metering Jet: Adjustable. Seat size No. 51 (.067 inch) drill. Setting see adjustments.

Nozzle: Size No. 36 (.106 inch) drill.

Air Bleed To Nozzle: (Thru plug) size No. 65 (.035 inch) drill.

Choke: Manual, butterfly type with poppet valve.

Vacuum Spark Port: None.

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap	Breaker Point Setting	Ignition Timing Breaker Points to Open:	Valve Setting (Hot)	Float Setting (See Adjustments)	Idle Adjustment Screw Setting
.025"	.020"	19° B. T. C.	Intake .014" Exhaust .014"		¼ to 1 Turn Open

CARBURETER ADJUSTMENTS

Float adjustment: With throttle body inverted and gasket removed, there should be 17/64 inch clearance (plus or minus 1/64 inch) between machined surface of throttle body and seam of float (both sides). To adjust, bend lip on float lever.

Idle adjustment: Set throttle lever adjusting screw until motor runs approximately 400 r.p.m. Then set idle adjustment screw for highest steady vacuum gauge reading or smoothest engine operation. Correct setting will be found between ¼ to 1 turn open.

High speed adjustment With hand throttle wide open and engine operating at 1800 r p m (maximum governed speed) adjust high speed adjusting needle until smoothest engine operation is obtained This setting will be found between 1/4 to 1 1/4 turns open

Maximum performance can be secured only when breaker points spark plugs valves and motor timing are set to manufacturer s specifications

If carbureter does not respond to the above adjustments, disassemble, clean all parts in carbureter cleaner, rinse and blow out all passages with compressed air Replace all worn or damaged parts Always use new gaskets See form No 3525 for complete overhaul procedure

WGD Dual Down-Draft Climatic® Control **Carbureter No. 2393S**

CARBURETER SPECIFICATIONS

For Packard 8 Cylinder Engine: 4 Inch Bore, 3½ Inch Stroke

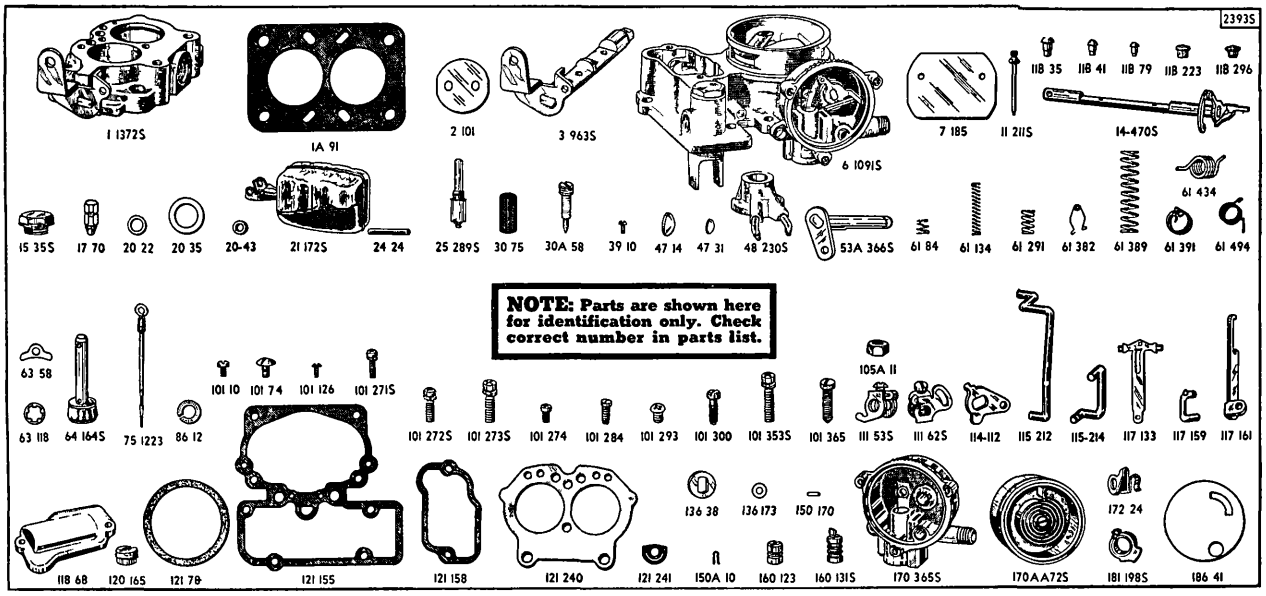
Dimensions: Flange size 1¼ inch dual, 4 bolt type Primary venturi, 11/32 inch I D Secondary venturi, 21/32 inch I D Main venturi, 1-3/16 inch I. D.
Vent: Outside, I
Gasoline Intake: Size .1015 inch diameter in needle seat
Low Speed Jet Tube: Jet, size 032 inch diameter By pass, in bowl cover, size No 54 (055 inch) drill Economizer, in bowl cover, size No 55 (052 inch) drill Idle bleed, in bowl cover, size 051 inch diameter
Idle Port: Upper, slot type, length 160 inch, width 030 inch
Idle Port Opening: 109 to 115 inch above top edge of valve with valve tightly closed
Lower Port (For Idle Adjustment Screw): Size 065 to 069 inch diameter
Set Idle Adjustment Screw: ¾ to 1¾ turns open For richer mixture turn screw out Do not idle engine below 400 RPM in drive range
Nozzle: Nozzle is installed permanently DO NOT REMOVE Anti percolating well jet, size No 70 (028 inch) drill.
Metering Rod (Vacumeter Type): Economy step, 064 inch diameter Middle step tapers to 0555 inch diameter Power step 048 inch diameter These rods designed with idle stabilizing flats on economy step
Metering Rod Jet: Size 086 inch diameter
Accelerating Pump: Discharge jet (twin) size No 72 (025 inch) drill Intake ball check, in plunger shaft Discharge (needle seat) size No 50 (070 inch) drill
Choke Carter Climatic® Control—set two points rich, butterfly type offset valve Choke heat suction hole in piston housing, size No 46 (081 inch) drill
Vacuum Spark Port: Horizontal slot (round end) 040 x 130 inch Bottom of port to be 000 to 006 inch above upper edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION. Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .015"	Ignition Timing Breaker Points to Open: 5° B. T. C. At Vibration Damper	Float Setting 3/16 Inch (Use Gauge T109-28)	Idle Adjustment Screw Setting ¾ to 1¾ Turns Open Idle Engine at 400 R.P.M. In Drive Range

NOTE: These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT.



CARBURETER ADJUSTMENTS

Float Adjustment: With bowl cover gasket removed, bowl cover inverted and needle seated, there should be 3/16 inch (gauge T109-28) between top of float and bowl cover Adjust by bending float lever.
Float Alignment: Side of float parallel to edge of casting Minimum clearance between lever and air horn lugs without binding Adjust by bending float lever
Pump Adjustment: Back out throttle lever set screw until throttle valves seat in bores of carbureter Hold straight edge across top of dust cover at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at upper angle (Use bending tool T109-213)
Metering Rod Adjustment: The metering rods must be adjusted after the pump adjustment No metering rod gauges are necessary; procedure is as follows With the throttle lever set screw backed out and throttle valves seated in bores of carbureter, press down on vacumeter link until metering rods bottom in casting With rods held in this position, revolve metering rod arm until lip contacts vacumeter link Hold in place and carefully tighten metering rod arm set screw
Fast Idle Adjustment: With the thermostatic coil housing gasket and baffle plate removed, crack throttle valve and hold choke valve closed Then close throttle There should now be 024 inch clearance (gauge T109-189) between throttle valve and bore of carbureter (side opposite idle port) Adjust by bending the choke connector rod at lower angle (Use bending tool T109-213)
Unloader Adjustment: This adjustment must be made after fast idle adjustment Hold throttle valve in wide open position and close choke valve as far as possible without forcing There should be ⅛ inch (gauge T109 36) clearance between upper edge of choke valve and inner wall of air horn Adjust by bending unloader arm on choke piston lever (Use bending tool T109-213)

WCFB Four-Bore Down-Draft Climatic® Control **Carbureter No. 2394S**

CARBURETER SPECIFICATIONS

For Packard 8 Cylinder Engine: 4 Inch Bore, 3½ Inch Stroke

Dimensions: Flange size, 1¼ inch Four Bore—4 bolt type.
Primary venturi size, 11/32 inch I. D.
Main venturi (primary) size, 1-1/16 inch I. D.
Main venturi (secondary) size, 1¼ inch I. D.

Vents: Outside, 4. Inside, 5.

Gasoline Intake: Size No. 42 (.0935 inch) drill hole in needle seat.

Low Speed Jet Tube: (Primary side only). Jet, size No. 65 (.035 inch) drill.
By-Pass, in body, size No. 54 (.055 inch) drill.
Economizer, in screw plug, size .0492 inch diameter.
Idle Bleed, in body, size .063 inch diameter.

Idle Port: (Upper) slot type. Primary, length .185 inch; width .030 inch. Secondary, none.

Idle Port Opening: Primary, .130 to .136 inch above top edge of valve with valve tightly closed. Secondary, none.

Lower Port: Primary (for idle adjustment screw), size No. 53 (.0595 inch) drill. Secondary, none.

Set Idle Adjustment Screw: ¾ to 1¾ turns open. For richer mixture turn screw out. Do not idle engine below 400 r.p.m. Automatic Trans.—in Drive Range; 475 r.p.m. for Standard and Overdrive Trans.

Main Nozzle: Installed permanently. DO NOT REMOVE. Anti-percolating jet, primary and secondary, size No. 70 (.028 inch) drill.

Metering Rod: Primary, economy step .072 inch diameter. Middle step tapers to .055 inch diameter. Power step, .040 inch diameter. Secondary, none.

Metering Rod Jet: Primary size .0935 inch; secondary size .0635 inch diameter.

Accelerating Pump: Discharge jet (Twin) primary side only, size No. 72 (.025 inch) drill. Intake ball check seat, size .115 to .120 diameter. Discharge needle seat, size .070 inch diameter. Pump passage disk check, size No. 55 (.052 inch) drill.

Choke: Carter Climatic® Control, set on index. Butterfly type—offset choke valve, primary side only. Choke heat suction hole, restriction in piston housing, size No. 43 (.089 inch) drill.

Vacuum Spark Port: Horizontal, slot, round end type—.130 x .040 inch. Bottom of port to be .000 to .006 inch above top edge of valve with valve tightly closed.

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

S 8 PRINTED IN U.S.A.

CARBURETER ADJUSTMENTS

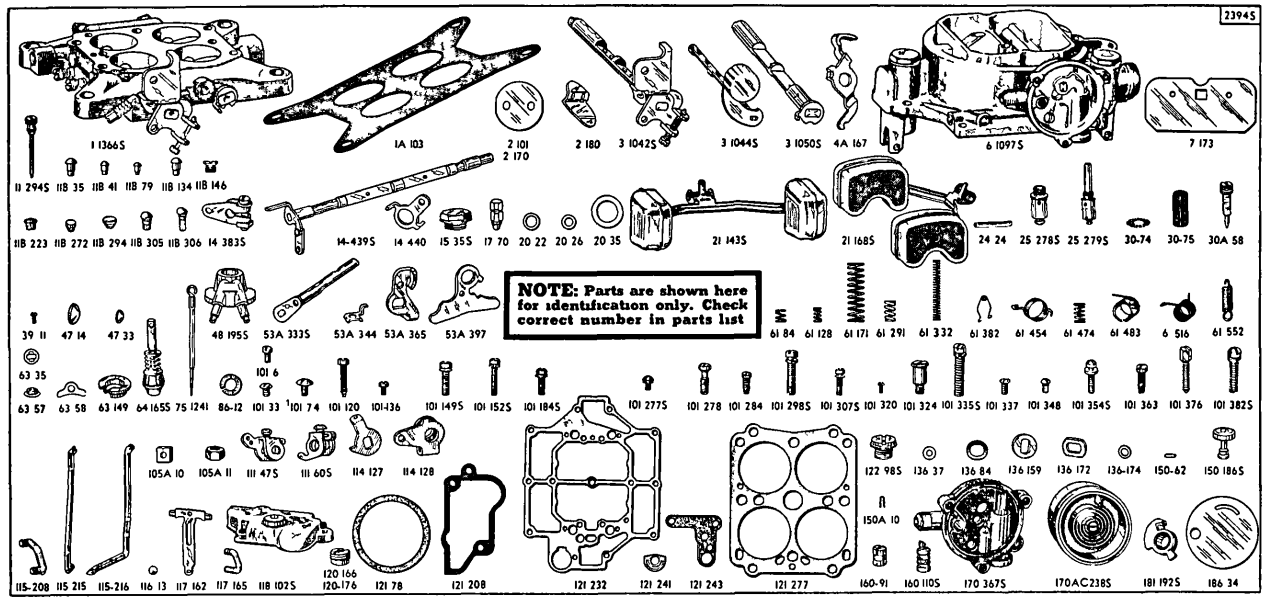
FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical. LATERAL ADJUSTMENT: With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting. Side of floats should just clear the vertical uprights of float gauge. Adjustment should be made by bending arms of floats. VERTICAL ADJUSTMENT: With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance between top of float and machined surface of casting must be 1/8 inch (gauge T109-232) for primary floats and 3/16 inch (gauge T109-222) for secondary floats. Adjust by bending float arms.

FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of float, the distance between top of floats and bowl cover should be 5/8 inch for primary floats and 11/16 inch for secondary floats. Adjust by bending stop tabs on float brackets.

PUMP ADJUSTMENT: Install pump connector link in outer hole (long stroke) of pump arm, with ends extending toward countershaft arm. Back out throttle lever set screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at lower angle. (Use tool T109-213.)

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: (1) Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. (2) With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. (3) Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.

BOWL VAPOR VENT ADJUSTMENT: This adjustment should be made after completing pump and metering rod adjustments. Install dust cover and dust cover gasket. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter. There should be 1/16 inch (gauge T109-197) between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm.



FAST IDLE ADJUSTMENT: (a) Loosen choke lever clamp screw on choke shaft. Insert .025 inch wire gauge (T109-189) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw. (b) With choke valve tightly closed tighten fast idle adjusting screw until there is .023 inch (gauge T109-189) opening between throttle valve and bore of carbureter side opposite idle port. Be sure fast idle adjusting screw is on high step of cam while making this adjustment.

UNLOADER ADJUSTMENT: With throttle wide open there should be 9/32 inch (gauge T109-126) clearance between upper edge of choke valve and inner wall of air horn. Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

SECONDARY THROTTLE LEVER ADJUSTMENT: Primary and secondary throttle valves should reach wide open position at the same time. To adjust, bend throttle operating rod at upper angle. (Use bending tool T109-213.) With primary and secondary throttle valves in tightly closed position there should be .008-.013 inch (gauge T109-200) clearance between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on primary lever.

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: This adjustment should be made after completing fast idle and secondary throttle lever adjustments. Crack throttle valves and hold choke valve tightly closed. Then close throttle. Tang on secondary throttle lever should freely engage in notch of lockout dog. If necessary to adjust, bend tang on secondary throttle lever.

WCFB Four-Bore Down-Draft Climatic® Control **Carbureters Nos. 2232S-2284S**

CARBURETER SPECIFICATIONS

For Packard 8 Cylinder Engine: 3-13/16 Inch Bore, 3½ Inch Stroke

Dimensions: Flange size, 1⅛ inch Four Bore—4 bolt type.
Primary venturi size, 11/32 inch I. D.
Main venturi (primary) size, 1-1/16 inch.
Main venturi (secondary) size, 15/16 inch I. D.

Float Level: See adjustments.

Vents: Outside, none. Inside, balance vent tube in air horn, 2 on primary side, 3 on secondary side.

Gasoline Intake: Size No. 42 (.0935 inch) drill hole in needle seat.

Low Speed Jet Tube: (Primary side only).
Jet, size No. 68 (.031 inch) drill.
By Pass, in body, size No. 52 (.0635 inch) drill.
Economizer, in low speed jet assembly, size (.051 inch) diameter.
Idle bleed, in body, size No. 54 (.055 inch) drill.

Idle Port: (Upper) slot type. Primary, length .185 inch; width .030 inch. Secondary, none.

Idle Port Opening: Primary, .126 to .132 inch above top edge of valve with valve tightly closed. Secondary, none.

Lower Port: Primary (for idle adjustment screw), size No. 53 (.0595 inch) drill. Secondary, none.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture turn screw out. Do not idle engine below 400 r.p.m. Automatic Trans.—in Drive Range.

Main Nozzle: Installed permanently. DO NOT REMOVE. Anti-percolating jet (off nozzle well), size No. 71 (.026 inch) drill.

Metering Rod: Primary, economy step (2232S) .074, (2284S) .078 inch diameter. Middle step tapers to (2232S) .069, (2284S) .0715 inch diameter. Power step, .0625 inch diameter. Secondary, none.

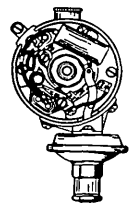
Metering Rod Jet: Primary, size .098 inch diameter (for metering rod). Secondary, size (2232S) (.052 inch); (2284S) (.055 inch) diameter.

Metering Rod Setting: See adjustments.

Accelerating Pump: Discharge jet (twin) primary side only, size No. 70 (.025 inch) drill.
Intake ball check seat, size .115 to .120 inch diameter.
Discharge needle seat, size .070 inch diameter.
Pump passage, disk check size No. 55 (.052 inch) drill.

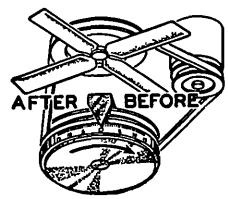
Pump Adjustment: See adjustments.

Choke: Carter Climatic® Control, set one point rich. Butterfly type—offset choke valve, primary side only. Choke heat suction hole, restriction in piston housing, size No. 43 (.089 inch) drill.

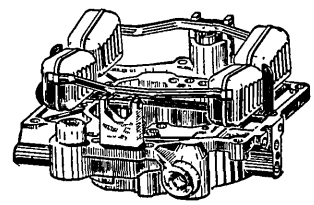


Vacuum Spark Port: Round type—.103-.105 inch diameter. Top of port .046 to .056 inch above valve with valve tightly closed.

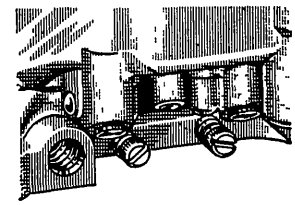
Motor Tune-Up—Be Accurate! Always Use Feeler Gauges!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .035"



Breaker Point Setting .015"

Ignition Timing Breaker Points to Open: 5° B. T. C.

Float Setting (See Adjustments)

Idle Adjustment Screw Setting ½ to 1½ Turns Open

NOTE: These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT.

CARBURETER
TRADE MARK REG. U. S. PAT. OFF
MARCA REGISTRADA

PRINTED IN U.S.A.

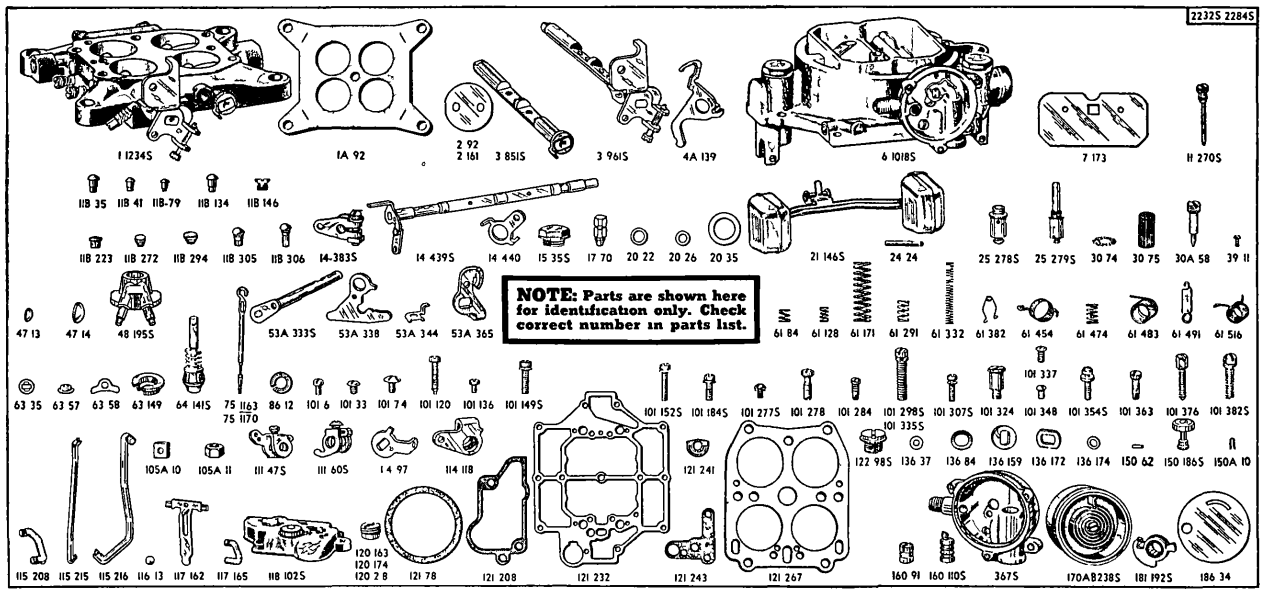
CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical. **LATERAL ADJUSTMENT:** With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting. Side of floats should just clear the vertical uprights of float gauge. Adjustment should be made by bending arms of floats. **VERTICAL ADJUSTMENT:** With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance between top of float and machined surface of casting must be 1/8 inch (gauge T109-232) for primary floats and 5/32 inch (gauge T109-236) for secondary floats. Adjust by bending float arms.

FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of float, the distance between top of floats and bowl cover should be 5/8 inch for primary floats and 21/32 inch for secondary floats. Adjust by bending stop tabs on float brackets.

PUMP ADJUSTMENT: Install pump connector link in outer hole (long stroke) of pump arm, with ends extending toward countershaft arm. Back out throttle lever set screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at lower angle. (Use tool T109-213.)

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: (1) Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. (2) With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. (3) Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.



BOWL VAPOR VENT ADJUSTMENT: This adjustment should be made after completing pump and metering rod adjustments. Install dust cover and dust cover gasket. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter. There should be 1/16 inch (gauge T109-197) between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm.

FAST IDLE ADJUSTMENT: (a) Loosen choke lever clamp screw on choke shaft. Insert .020 inch feeler gauge (T109-29) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw. (b) With choke valve tightly closed tighten fast idle adjusting screw until there is .031 inch (gauge T109-29 may be used) opening between throttle valve and bore of carbureter side opposite idle port. Be sure fast idle adjusting screw is on high step of cam while making this adjustment.

UNLOADER ADJUSTMENT: With throttle wide open there should be 3/16 inch (gauge T109-28) clearance between upper edge of choke valve and inner wall of air horn. Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

SECONDARY THROTTLE LEVER ADJUSTMENT: Primary and secondary throttle valves should reach wide open position at the same time. To adjust, bend throttle operating rod at upper angle. (Use bending tool T109-213). With primary and secondary throttle valves in tightly closed position there should be .017-.022 inch (gauge T109-29) clearance between positive closing shoes on primary and secondary throttle levers. To adjust bend shoe on primary lever.

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: This adjustment should be made after completing fast idle and secondary throttle lever adjustments. Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lockout dog. If necessary to adjust, bend tang on secondary throttle lever.

Packard—1955—Carbureters Nos. 2232S-2284S

WHEN SERVICING, USE GASKET ASSORTMENT No. 266; REPAIR PACKAGE No. 1799 (2232S), No. 1800 (2284S)

WCFB Four-Bore Down-Draft Climatic® Cont. **Carbs. Nos. 2084S-2103S-2112S-2142S**

CARBURETER SPECIFICATIONS

For Packard 8 Cylinder Engine: 3½ Inch Bore, 4¼ Inch Stroke (2084S-2103S-2142S)
For Packard 8 Cylinder Engine: 3-9/16 Inch Bore, 4½ Inch Stroke (2112S)

Dimensions: Flange size, 1⅛ inch Four Bore 4 bolt type.
Primary venturi size, 11/32 inch I. D.
Main venturi (Primary side) 1-1/16 inch I. D.
Main venturi (Secondary side) (2084S, 2103S, 2112S) 15/16 inch I. D.; (2142S) 1-1/16 inch I. D.

Float Level: See adjustments.

Vents: Outside, none. Inside, balance vent tube in air horn, 2 on primary side, 3 on secondary side.

Gasoline Intake: Size No. 42 (.0935 inch) drill hole in needle seat.

Low Speed Jet Tube: Primary side: Jet, size (2084S, 2103S, 2112S) No. 67 (.032 inch) drill; (2142S) No. 66 (.033 inch) drill. By-pass, in body, size (2084S, 2103S, 2142S) No. 53 (.0595 inch) drill; (2112S) No. 55 (.052 inch) drill. Economizer, in body, size .0452 inch diameter. Idle bleed, in body, size (2084S, 2103S, 2142S) No. 51 (.067 inch) drill; (2112S) No. 55 (.052 inch) drill.
Secondary side: Jet, size (2084S, 2103S) No. 70 (.028 inch) drill; (2112S) No. 67 (.032 inch) drill; (2142S) No. 66 (.033 inch) drill. By-pass, in body, size No. 53 (.0595 inch) drill. Economizer, in body, size (2142S) .0452 inch diameter; (2084S, 2103S, 2112S) None. Idle bleed, in body, size (2142S) No. 51 (.067 inch) drill; (2084S, 2103S, 2112S) None.

Idle Port: Upper, slot type. Primary: (2084S, 2103S, 2142S) length .175 inch, (2112S) .190 inch; width .030 inch. Secondary, length .103 inch; width .030 inch.

Idle Port Opening: Primary (2084S, 2103S, 2142S) .122 to .128 inch; (2112S) .137 to .143 inch; secondary .070 to .076 inch above top edge of valve with valve tightly closed.

Lower Port: Primary (for idle adjustment screw) size No. 52 (.0635 inch) drill. Secondary, none.

Set Idle Adjustment Screw: (2084S, 2103S) 1¼ to 2¼ turns; (2112S) ¾ to 1¾ turns; (2142S) 1 to 2 turns open. For richer mixture turn screw out. Do not idle engine below 400 r.p.m. (shift lever in neutral).

Main Nozzle: Installed permanently. DO NOT REMOVE. Anti-percolating plug (in nozzle well), size No. 64 (.036 inch) drill.

Metering Rod: Primary: Economy step .066 inch diameter. Power step .052 inch diameter.
Secondary, none.

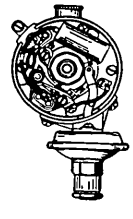
Metering Rod Jet: Primary: Size .086 inch diameter.
Secondary: Size (2084S, 2103S) .073 inch; (2112S) .0785 inch; (2142S) .067 inch diameter.

Metering Rod Setting: See adjustments.

Accelerating Pump: Discharge jet (twin) primary side only, size No. 74 (.0225 inch) drill. Intake ball check seat, size .115 to .120 inch diameter. Discharge needle seat, size .070 inch diameter. Relief ball check, size No. 55 (.052 inch) drill. (2112S)

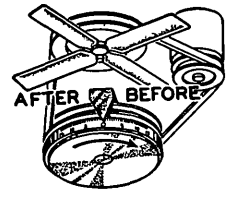
Pump Adjustments: See adjustments.

Choke: Carter Climatic® Control, (2084S, 2103S, 2142S) set on index, (2112S) 1½ points lean. Butterfly type offset choke valve, primary side only. Choke heat suction hole, restriction in piston housing, size No. 44 (.086 inch) drill.



Vacuum Spark Port: Round type, .104 inch diameter. Top of port .052-.062 inch above valve, with valve tightly closed.

Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

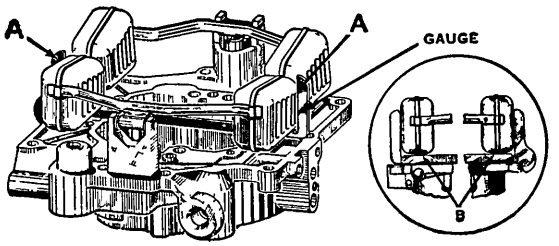

Figure 1
Float Adjustment

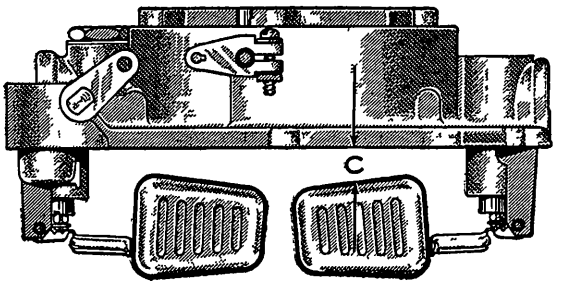

Figure 2
Float Drop Adjustment

FLOAT ADJUSTMENT (Fig 1)

Two separate float adjustments must be made—lateral and vertical

LATERAL ADJUSTMENT With bowl cover assembly inverted bowl cover gasket removed and float lip resting on seated needle place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting Side of floats should just clear the vertical uprights of float gauge (A) Adjustment should be made by bending arms of floats VERTICAL ADJUSTMENT With float gauge in same position floats should just clear the horizontal portion of gauge Vertical distance (B) between top of float and machined surface of casting must be (Primary) (2084S 2103S 2142S) 5/32 inch (Gauge T109 236) (2112S) 1/8 inch (Gauge T109 232) Secondary floats 5/32 inch (Gauge T109 236) Adjust by bending float arms

FLOAT DROP ADJUSTMENT (Fig 2)

With bowl cover held in upright position and measuring from center of floats (C) the distance between top of floats and bowl cover should be 5/8 inch for both primary and secondary floats Adjust by bending stop tabs on float brackets

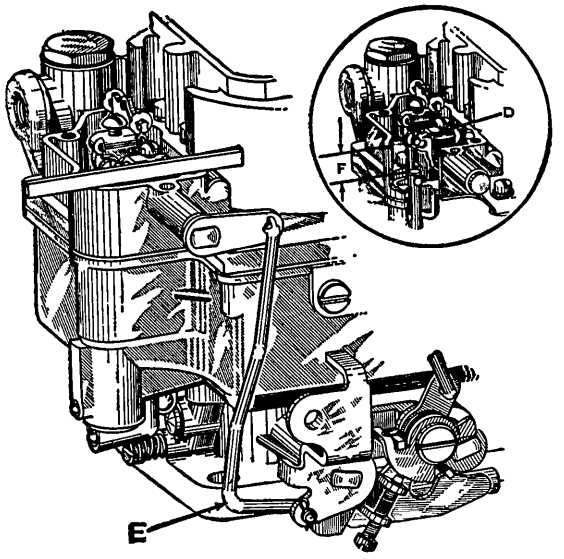

Figure 3
Pump Adjustment

PUMP ADJUSTMENT (Fig 3)

Install pump connector link in outer hole (long stroke) of pump arm (D) with ends extending toward countershaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at lower angle (E) (Use tool T109 213)

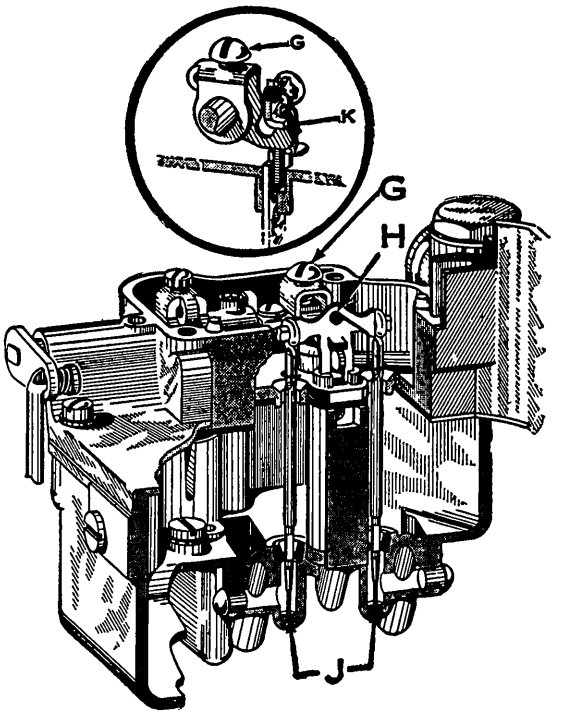

Figure 4
Metering Rod Adjustment

METERING ROD ADJUSTMENT (Fig 4)

Metering rod adjustment is important and must be made after completing the pump adjustment No metering rod gauges are necessary Procedure is as follows 1 Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw (G) 2 With metering rods in place press down on vacumeter link (H) until metering rods bottom in carbureter body casting (J) 3 Holding rods in downward position and throttle valves seated revolve metering rod arm until finger on arm contacts lip of vacumeter link (K) Hold in place and carefully tighten clamp screw (G)

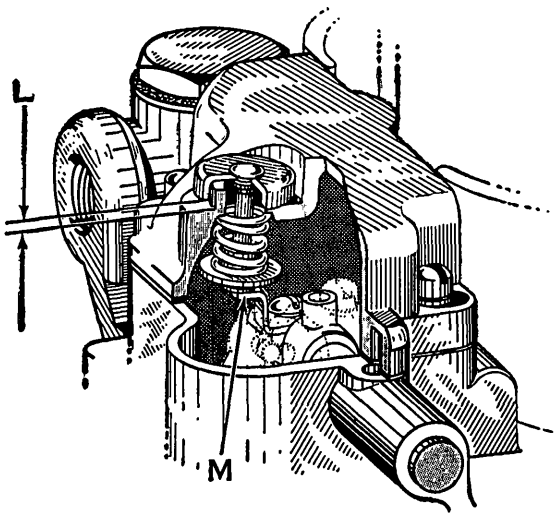

Figure 5
Bowl Vapor Vent Adjustment

BOWL VAPOR VENT ADJUSTMENT (Fig. 5):

This adjustment should be made after completing pump and metering rod adjustments. Install dust cover and dust cover gasket. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter. There should be 3/32 inch (L) (gauge T109-125) between lower edge of bowl vapor vent valve and dust cover. To adjust remove dust cover and bend vapor vent arm (M).

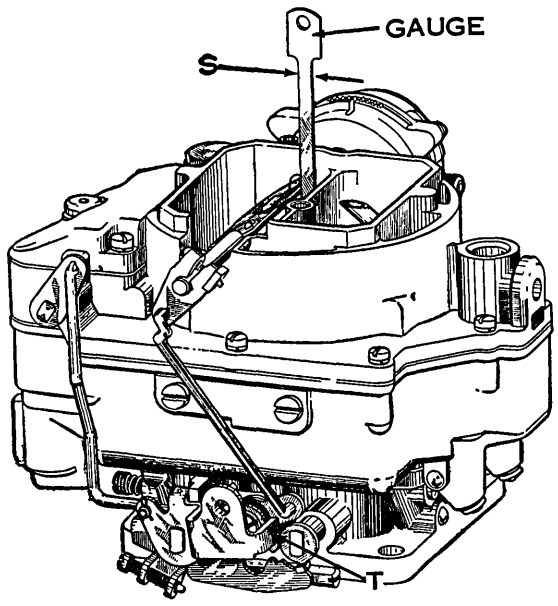

Figure 7
Unloader Adjustment

UNLOADER ADJUSTMENT (Fig. 7):

With throttle wide open there should be 9/32 inch (Gauge T109-126) clearance (S) between upper edge of choke valve and inner wall of air horn. Adjust by bending unloader lip (T) on throttle shaft lever (use bending tool T109-41).

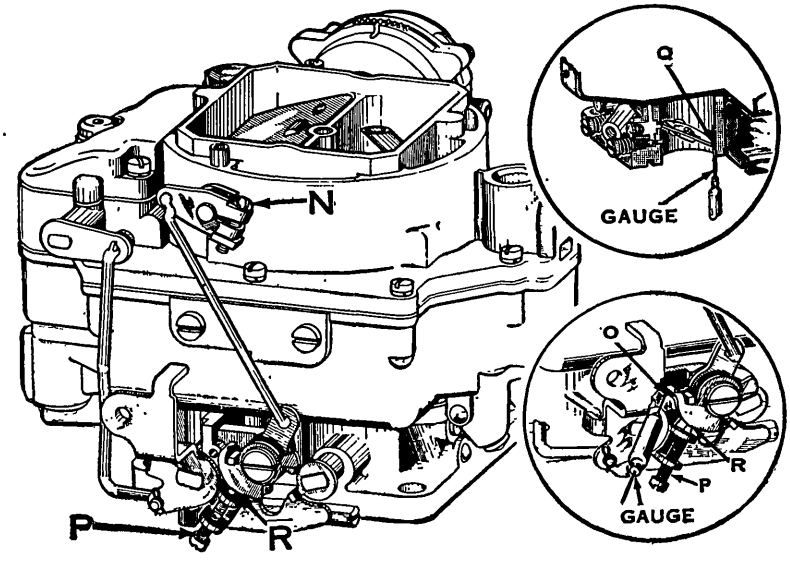

Figure 6
Fast Idle Adjustment

FAST IDLE ADJUSTMENT (Fig. 6):

(a) Loosen choke lever clamp screw (N) on choke shaft. Insert .020" feeler gauge (T109-29) between lip of fast idle cam and boss of flange casting (O). Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw (N). (b) With choke valve tightly closed, tighten fast idle adjusting screw (P) until there is (2084S-2103S-2142S) .020 inch (Gauge T109-29), (2112S) .026 inch (Gauge T109-189) opening between throttle valve and bore of carbureter (side opposite idle port (Q). Be sure fast idle adjusting screw is on high step of cam (R) while making this adjustment.

Part No	PART NAME	
49-182	Switch plunger (2084S)	
53A-333S	Pump operating lever and countershaft assembly	
53A-338	Lockout arm	
53A-344	VENT ARM	
53A-358	Secondary operating lever	
61-84	Idle adjustment screw spring	(2)
61-128	Connector rod spring	
61-171	PUMP SPRING (lower)	
61-243S	Contact spring and washer assembly (2084S)	
61-291	Throttle lever adjusting screw spring	
61-382	METERING ROD SPRING	
61-388	Switch return spring (2084S)	
61-453	Throttle flex spring	
61-454	Fast idle cam spring	
61-474	Bowl vent spring	
61-483	SECONDARY THROTTLE RETURN SPRING	
61-485	VACUUM PISTON SPRING	
63-35	Spring retainer	
63-57	INTAKE CHECK BALL RETAINER	
63-58	Coil housing retainer	(3)
63-149	Bowl vent spring retainer	
64-141S	PUMP PLUNGER ROD SPRING AND RETAINER ASSEMBLY	
75 942	METERING ROD—standard	(2)
75-987	Metering rod—1 size lean	(2)
75 988	Metering rod—2 sizes lean	(2)
86-12	Flange stud lock washer	(4)
86-37	Switch terminal lock washer (2084S)	(2)
101-6	Pump arm clamp screw	
101-10	Pump arm clamp screw (Sup by 101 6)	
101-33	Metering rod arm clamp screw	
101-74	Throttle shaft screw	(2)
101-109	Switch terminal screw (2084S)	
101-136	Coil housing attaching screw	(3)
101-149S	Body flange attaching screw and washer assembly	(4)
101-152S	Air horn attaching screw and washer assembly	
101-160S	Air horn attaching screw and washer assembly (2142S) (early prod—2084S 2103S 2112S)	(8)
101-184S	Dust cover attaching screw and washer assembly	(2)
101-277S	Vent arm attaching screw and washer assembly	
101-278	Pump jet and housing attaching screw	
101-284	Piston housing attaching screw	(2)
101-296	Fast idle adjustment screw	
101-307S	Air horn attaching screw and washer assembly (late prod—2084S 2103S 2112S)	(8)
101-324	Fast idle cam screw	
101-325S	Switch terminal cap attaching screw (2084S)	(2)
101-332	Throttle lever adjusting screw	
101-335S	Air horn attaching screw and washer assembly	(7)
101-337	Secondary throttle valve attaching screw	(4)
101-348	Primary throttle valve attaching screw	(4)
101-352S	Switch housing attaching screw and washer assembly (2084S)	(2)

Part No	PART NAME	
101-354S	Choke lever clamp screw assembly	
101-363	Piston housing attaching screw	
101-383	Fast idle adjustment screw (Sup by 101 296)	
105A-10	Choke lever nut	
105A-11	Flange stud nut	(4)
111-47S	Pump arm and screw assembly	
111-60S	Metering rod arm and screw assembly	
114-96	Primary throttle shaft arm (Inner)	
114-97	Primary throttle shaft arm (Outer) (2103S 2112S)	
114-107	Primary throttle shaft arm (Outer) (2084S 2142S)	
115-189	Choke connector rod	
115-197	THROTTLE CONNECTOR ROD	
115-202	Starter switch operating rod (2084S)	
115-208	Throttle operating rod	
116-13	PUMP INTAKE CHECK BALL	
116-19	Switch ball (2084S)	
117-28	Pump connector link	
117-155	Vacumeter piston link	
118-98S	Dust cover assembly	
120-165	PRIMARY METERING ROD JET	(2)
120-175	SECONDARY METERING JET (2084S 2103S)	(2)
120-185	Secondary metering jet (2142S)	(2)
120-194	Secondary metering jet (2112S)	(2)
121-78	COIL HOUSING GASKET	
121-149	Pump jet housing gasket (2084S) (Sup by 121 241)	
121-208	DUST COVER GASKET	
121-229	AIR CLEANER GASKET	
121-231	BODY FLANGE GASKET (2084S 2142S)	
121-232	AIR HORN GASKET	
121-241	PUMP JET HOUSING GASKET	
121-242	Body flange gasket (2103S 2112S)	
121-243	PISTON HOUSING GASKET	
122-98S	Pump relief valve assembly (2112S)	
136-37	Throttle and starter switch operating rod washer (2084S—7) (2103S 2112S 2142S—5)	
136-84	Throttle shaft spring washer	
136-159	Primary throttle shaft washer	
136-172	Secondary throttle shaft washer	
150-62	Choke piston pin	
150-186S	Pin and valve cap assembly	
150A-10	PIN SPRING (2084S—7) (2103S 2112S 2142S—5)	
153-11	Switch contact spring shim (.018") (2084S)	
153-12	Switch contact spring shim (.006") (2084S)	
160-91	Choke piston	
160-110S	Vacuum piston and pin assembly	
170-259S	Piston housing and plug assembly	
170AC238S	Thermostatic coil and housing assembly	
172-15	Cable clip (2084S)	
181-192S	Fast idle cam and spring assembly	
184-64S	Terminal cap assembly (2084S)	
186-34	Choke baffle plate	
192-21U	Carter starter switch unit (2084S)	
192-28S	Carter starter switch complete (2084S)	

NOTE Figures in parentheses indicate number of pieces used in one carbureter Where no figure is shown only one is used

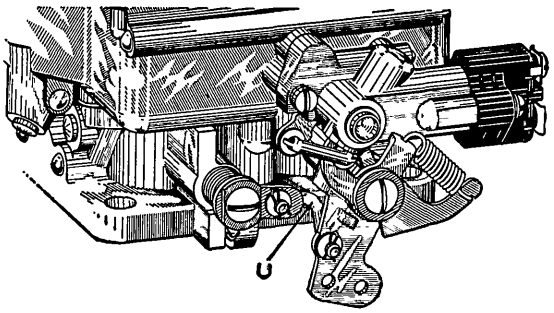

Figure 8
Secondary Throttle Lever Adjustment

SECONDARY THROTTLE LEVER ADJUSTMENT (Fig. 8):

Primary and secondary throttle valves should reach wide open position at the same time. To adjust: Bend throttle operating rod at upper angle (U). (Use bending tool T109-213.)

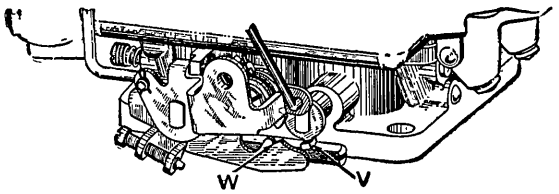

Figure 9
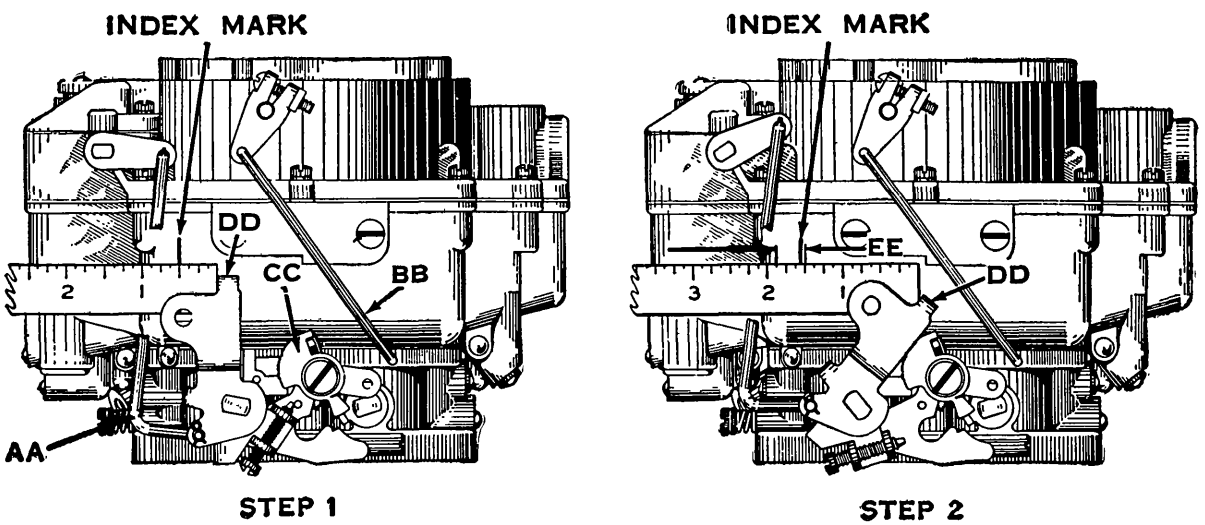
Secondary Throttle Lock-Out Adjustment

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT (Fig. 9):

This adjustment should be made after completing fast idle and secondary throttle lever adjustments. (a) With choke valve tightly closed, open primary throttle valves all the way. Tang (V) on secondary throttle arm should engage in notch (W) on lock-out lever preventing secondary throttle shaft movement. (b) Hold choke valve in wide open position. Open primary throttle valves all the way. Lock-out lever should fall free allowing secondary throttle valves to be opened before primary throttle valves are fully open. If necessary, bend tang (V) on secondary throttle lever to provide clearance for proper operation of lock-out lever.



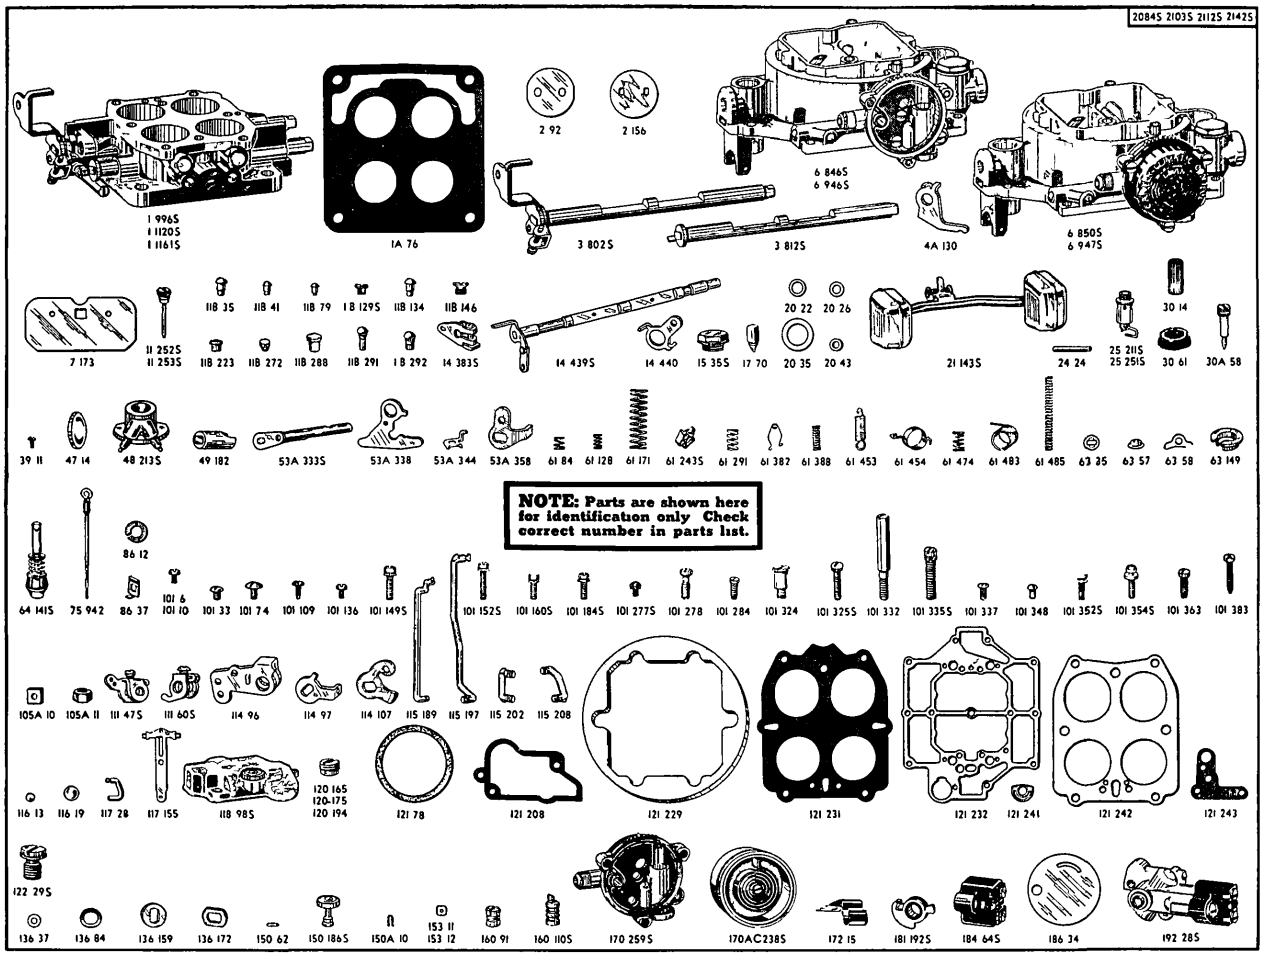


Figure 10
Checking and Adjusting Starter Switch

CHECKING AND ADJUSTING STARTER SWITCH (2084S Only) (Fig. 10):

Connect a 6-volt battery and test lamp across switch terminal, so that lamp will light when switch makes contact. 1. Back off throttle stop screw, remove throttle connector rod (AA) and choke connector rod (BB), rotate fast idle cam (CC) to slow idle position, and fully close the throttle valves. 2. While holding throttle valves fully closed, place a scale against choke unloader arm of throttle lever and make an index mark on carbureter body at the 1/2 inch division of scale. 3. With test lamp connected hold end of scale against unloader arm (DD) and slowly open throttle until test lamp lights. 4. If switch is correctly timed, the scale will then read between 1 1/2 and 1 7/8 inch at mark on carbureter body (EE) (1 inch to 1 3/8 inch travel of arm). 5. If necessary, make switch adjustment by reducing or increasing the total thickness of the brass shims. If switch timing was found to be too early, reduce the total thickness of the shims. If timing was too late, increase total thickness of shims. Two sizes of shims are available: 153-11 .018 inch—153-12 .006 inch.

Packard 8—1953-1954—Carbureters Nos. 2084S-2103S-2112S-2142S

WHEN SERVICING, USE GASKET ASSORTMENT No 229 (2084S-2142S), No 233 (2103S-2112S), REPAIR PACKAGE No. 1841 (2084S-2103S-2112S)

WGD Dual Down-Draft Climatic® Control Carbureters—**Nos. 928S-2102S**

CARBURETER SPECIFICATIONS

For Packard 8 Cylinder Engine 3½ Inch Bore 4¼ Inch Stroke

Dimensions Flange size 1¼ inch dual 4 bolt type
Primary venturi 11/32 inch I D
Secondary venturi 21/32 inch I D
Main venturi 1 3/16 inch I D

Float Level See Adjustments

Vents Inside none Outside vent No 10 (1935") drill

Gasoline Intake Size No 42 (0935 inch) drill in needle seat

Low Speed Jet Jet size No 67 (032 inch) drill By Pass in air horn size No 55 (052 inch) drill Economizer in air horn size 045 inch diameter Idle bleed in air horn size No 56 (0465 inch) drill

Idle Ports Upper port slot type length 187 inch Width 030 inch

Idle Port Opening 135 to 141 inch above upper edge of valve with valve tightly closed

Lower Port (for Idle Adjustment Screw) Size 0615 to 0655 inch diameter

Set Idle Adjustment Screw ½ to 1½ turns open For richer mixture turn screw out Do not idle engine above 400 r p m on ultramatic transmission or above 450 r p m on standard transmission

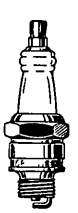
Nozzle In primary venturi angle 45° Nozzle is installed permanently **Do not remove** Anti percolating well plug jet size No 66 drill Anti percolating well to idle passage restriction size No 68 (031") drill

Metering Rod (Vacumeter Type) Economy step 0695 inch diameter Middle step tapers to 067 inch diameter Power step 061 inch diameter Length 2 59/64 inches

Metering Rod Jet 089 inch diameter

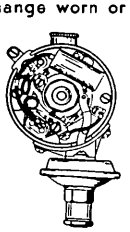
Metering Rod Setting See Adjustments

Accelerating Pump Discharge jet (twin) size No 74 (0225 inch) drill Intake check ball seat size No 40 (098 inch) drill Discharge needle seat size No 50 (070 inch) drill



Pump Adjustment See Adjustments

Choke Carter Climatic® Control set one point rich Butterfly type offset valve Choke heat suction hole in piston housing, size No 36 (1065 inch) drill



Vacuum Spark Port 103 to 105 inch diameter Top of port 052 to 062 inch above valve

Motor Tune-Up—Be Accurate!

NOTE These cars equipped with hydraulic valve lifters —No adjustment

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT With bowl cover gasket removed bowl cover inverted and needle seated there should be 13/64 inch (gauge T109-39) between top of float and bowl cover Adjust by bending float arm

PUMP ADJUSTMENT Install pump link in outer hole of pump arm and back out throttle lever set screw until throttle valves seat in bores of carbureter Place Universal pump travel gauge T109 117S inverted on edge of dust cover boss of bowl cover Turn knurled nut of gauge until finger on gauge just touches top of plunger shaft Number indicated on gauge should be 43 Adjust by bending throttle connector rod at upper angle
Optional Adjustment The distance from the dust cover boss to the top of the plunger shaft should be 32/64 inch Adjust as mentioned above

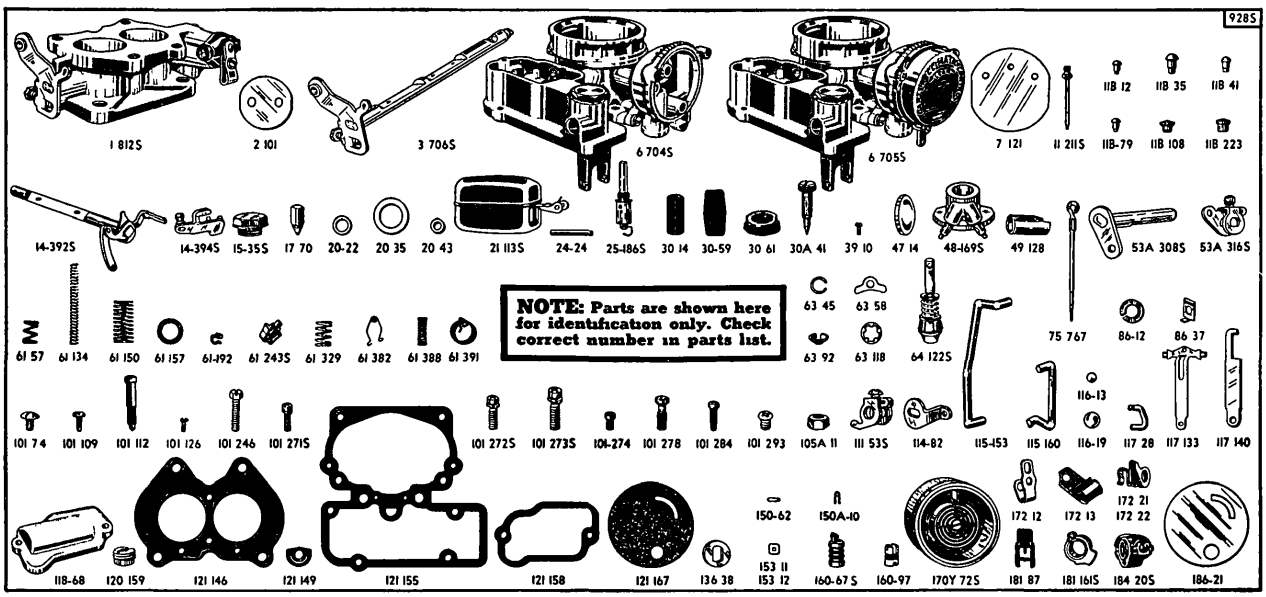
CARBURETER
TRADE MARK REG U S PAT OFF
MARCA REGISTRADA



PRINTED IN U S A

METERING ROD ADJUSTMENT The metering rods must be adjusted after the pump adjustment or when leaner than standard rods are installed No metering rod gauges are necessary procedure is as follows With the throttle lever set screw backed out and throttle valves seated in bores of carbureter press down on vacumeter link until metering rods bottom With rods held in this position, revolve metering rod arm until lip contacts vacumeter link Hold in place and carefully tighten metering rod arm set screw

FAST IDLE ADJUSTMENT With the thermostatic coil housing, gasket and baffle plate removed, crack throttle valve and hold choke valve closed Then close throttle There should now be 023" clearance (gauge T109-189) between throttle valve and bore of carbureter (side opposite idle port) Adjust by bending the choke connector rod at lower angle

UNLOADER ADJUSTMENT Must be made after fast idle adjustment Hold throttle valve wide open and close choke valve as far as possible without forcing there should now be 1/8 clearance between upper edge of choke valve and inner wall of air horn Adjust by bending arm on choke trip lever (tool T109-214)

STARTER SWITCH Adjustment should be made with Carter tool No T109-155S obtainable from your Carter distributor, with complete instructions Switch must make contact between 30° and 45° throttle opening

WGD Dual Down-Draft Climatic® Control Carbureters—**Nos. 784S-986S**

CARBURETER SPECIFICATIONS

For Packard 8 Cylinder Engine: 3½ Inch Bore, 3¾ Inch Stroke

Dimensions: Flange size, 1¼ inch dual, 4 bolt type.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 21/32 inch I. D.
Main venturi, 1-3/16 inch I. D.

Float Level: See Adjustments.

Vents: Inside, none. Outside vent, No. 10 (.1935") drill.

Gasoline Intake: Size No. 42 (.0935 inch) drill in needle seat.

Low Speed Jet Tube: Jet, size No. 67 (.032 inch) drill. By Pass, in air horn, size No. 55 (.052 inch) drill. Economizer, in air horn, size .045 inch diameter. Idle bleed, in air horn, size No. 56 (.0465 inch) drill.

Idle Ports: Upper port, slot type, length .187 inch. Width, .030 inch.

Idle Port Opening: .135 to .141 inch above upper edge of valve with valve closed tight.

Lower Port (For Idle Adjustment Screw): Size, .0615 to .0655 inch diameter.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture turn screw out. Do not idle engine above 400 r.p.m. on ultramatic transmission or above 450 r.p.m. on standard transmission.

Nozzle: In primary venturi, angle 45°. Nozzle is installed permanently. **Do not remove.** Anti-percolating well; plug jet size, No. 66 drill. Anti-percolating well to idle passage, restriction size: No. 68 (.031") drill.

Metering Rod (Vacumeter Type): Economy step, .0685 inch diameter. Middle step tapers to .066 inch diameter. Power step, .0595 inch diameter. Length 2-59/64 inches.

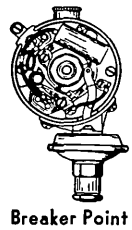
Metering Rod Jet: .089 inch diameter.

Metering Rod Setting: See Adjustments.

Accelerating Pump: Discharge jet (twin) size No. 74 (.0225 inch) drill. Intake check ball seat, size No. 40 (.098 inch) drill. Discharge needle seat, size No. 50 (.070 inch) drill.

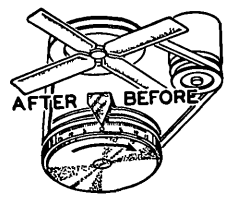
Pump Adjustment: See Adjustments.

Choke: Carter Climatic® Control set one point rich. Butterfly type, offset valve. Choke heat suction hole in piston housing, size No. 36 (.1065 inch) drill.

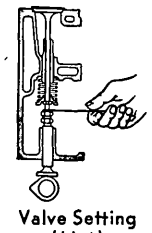


Vacuum Spark Port: .103 to .105 inch diameter. Top of port .052 to .062 inch above valve.

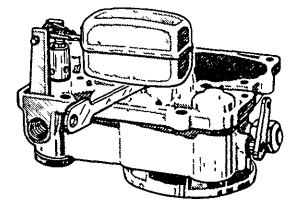
Motor Tune-Up—Be Accurate!



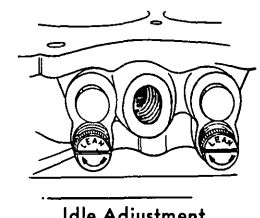
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .028"



Breaker Point Setting (1951) .017" (1952-54) .015"



Ignition Timing Breaker Points to Open: 6° B. T. D. C.

Valve Setting (Hot) Intake .007" Exhaust .010"

Float Setting 13/64 Inch (Use Gauge T109-39)

Idle Adjustment Screw Setting ½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: With bowl cover gasket removed, bowl cover inverted and needle seated, there should be 13/64 inch (gauge T109-39) between top of float and bowl cover. Adjust by bending float arm.

PUMP ADJUSTMENT: Install pump link in outer hole of pump arm and back out throttle lever set screw until throttle valves seat in bores of carbureter. Place Universal pump travel gauge T109-117S inverted on edge of dust cover boss of bowl cover. Turn knurled nut of gauge until finger on gauge just touches top of plunger shaft. Number indicated on gauge should be "43". Adjust by bending throttle connector rod at upper angle.
Optional Adjustment: The distance from the dust cover boss to the top of the plunger shaft should be 32/64 inch. Adjust as mentioned above.

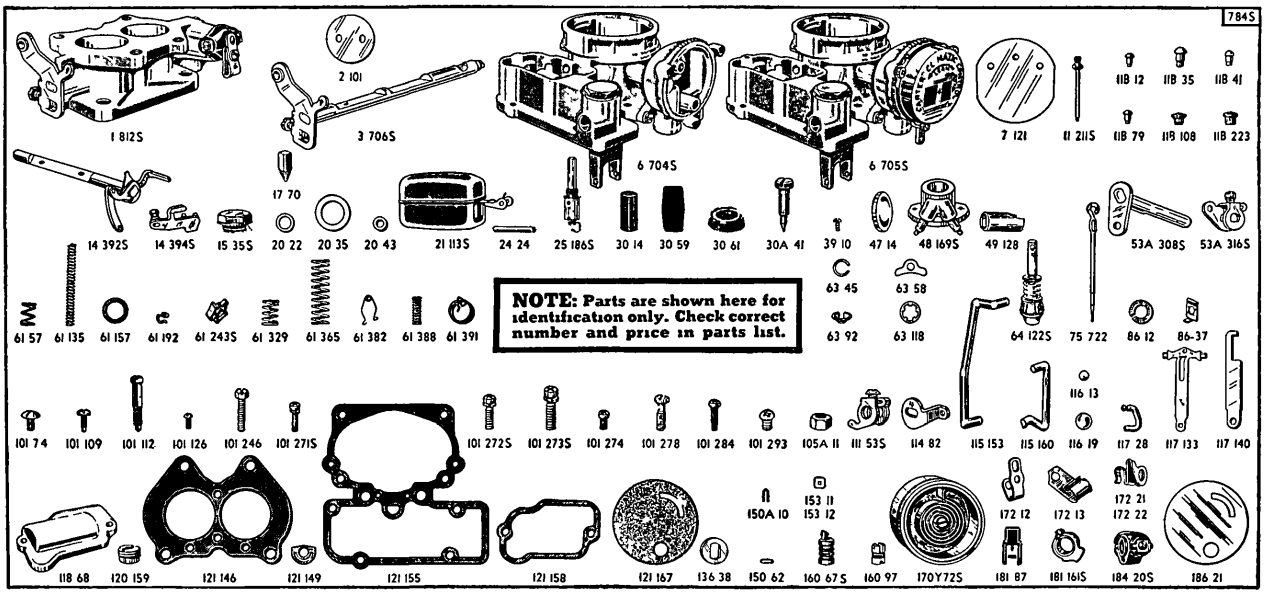
CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA



PRINTED IN U.S.A.

METERING ROD ADJUSTMENT The metering rods must be adjusted after the pump adjustment or when leaner than standard rods are installed No metering rod gauges are necessary, procedure is as follows With the throttle lever set screw backed out and throttle valves seated in bores of carbureter, press down on vacumeter link until metering rods bottom With rods held in this position, revolve meter ing rod arm until lip contacts vacumeter link Hold in place and carefully tighten metering rod arm set screw

FAST IDLE ADJUSTMENT With the thermostatic coil housing, gasket and baffle plate removed, crack throttle valve and hold choke valve closed Then close throttle There should now be 023" clearance (gauge T109-189) between throttle valve and bore of carbureter (side opposite idle port)

Adjust by bending the choke connector rod at lower angle

UNLOADER ADJUSTMENT. Must be made after fast idle adjustment Hold throttle valve wide open and close choke valve as far as possible without forcing, there should now be ⅛ inch clearance between upper edge of choke valve and inner wall of air horn Adjust by bending arm on choke trip lever (tool T109-214)

Packard 8—1951-1954—Carbureters Nos. 784S-986S

PACKARD EIGHT
MODELS
"300" AND PATRICIAN "400"
1953

(2084S can also be used)

WCFB Four Bore Down-Draft Climatic® Control **Carbureter No. 985S**

CARBURETER SPECIFICATIONS

For Packard 8 Cylinder Engine: 3½ Inch Bore, 4¼ Inch Stroke

Dimensions: Flange size, 1⅛ inch Four Bore 4 bolt type.
Primary venturi size: 11/32 inch I. D.
Main venturi size: 1-1/16 inch I. D.

Float Level: See adjustments.

Vents: Outside, none.
Inside, (6-846S and 6-850S) 2 on primary side; one on secondary side. (6-946S and 6-947S) 2 on primary side; 3 on secondary side.

Gasoline Intake: Size No. 42 (.0935 inch) drill hole in needle seat.

Low Speed Jet Tube: Jet, size No. 66 (.033 inch) drill.
By-pass, size No. 53 (.0595 inch) drill.
Economizer, size No. .04527 inch diameter.
Idle bleed, size No. 51 (.067 inch) drill.

Idle Port: (Upper) Slot type, Primary, length .175 inch, width .030 inch.
Secondary: Length .103 inch, width .030 inch.

Idle Port Opening: Primary, .122 to .128 inch. Secondary (Early Production), .062 to .068 inch, (Late Production), .070 to .076 inch, above upper edge of valve, with valve tightly closed.

Lower Port: Primary (for idle adjustment screw) Size No. 52 (.0635 inch) drill.
Secondary, none.

Set Idle Adjustment Screw: 1 to 2 turns open. For richer mixture turn screw out. Do not idle engine below 390 r.p.m.

Main Nozzle: Installed permanently. DO NOT REMOVE.
Anti-percolating plug (in nozzle well), Size No. 64 (.036 inch) drill.

Metering Rod: Primary; Economy step .066 inch diameter. Power step, .052 inch diameter. (These rods designed with stabilizing flat on economy step.)
Secondary, none.

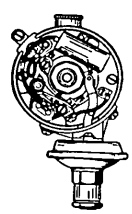
Metering Rod Jet: Primary; Size .086 inch diameter (for metering rod). Secondary; Size .067 inch diameter (no metering rod).

Metering Rod Setting: See adjustments.

Accelerating Pump: Discharge jet (twin) primary side only, size No. 74 (.0225 inch) drill. Intake ball check seat, size .115 to .120 inch diameter. Discharge needle seat, size .070 inch diameter. Relief ball check, size No. 55 (.052 inch) drill. (Early Production **Only.**)

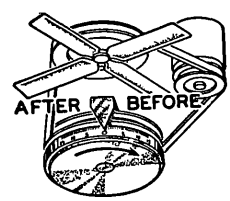
Pump Adjustment: See adjustments.

Choke: Carter Climatic ® Control, set on index. Butterfly type offset choke valve, primary side only. Choke heat suction hole, restriction in piston housing, size No. 44 (.086 inch) drill.

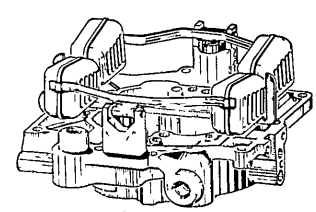


Vacuum Spark Port: Round type, .104 inch diameter. Top of port .052-.062 inch above valve, with valve tightly closed

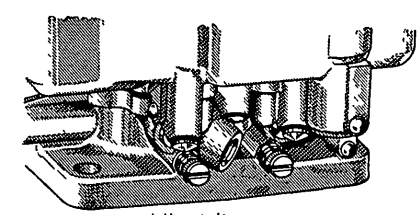
Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .023" to .028"



Breaker Point Setting .019"

Ignition Timing Breaker Points to Open: 6° B. T. D. C.

Float Setting 5/32 Inch (Use Gauge T109-236)

Idle Adjustment Screw Setting 1 to 2 Turns Open

NOTE: These cars equipped with Hydraulic Valve Lifters.—NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

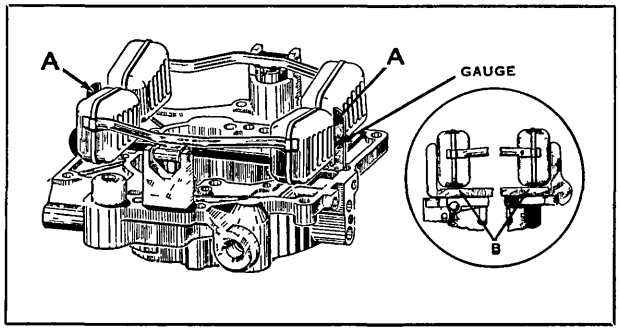

Figure 1
Float Adjustment

FLOAT ADJUSTMENT (Fig. 1):

Two separate float adjustments must be made—lateral and vertical

LATERAL ADJUSTMENT With bowl cover assembly inverted bowl cover gasket removed and float lip resting on seated needle, place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting Side of floats should just clear the vertical uprights of float gauge (A) Adjustment should be made by bending arms of floats VERTICAL ADJUSTMENT With float gauge in same position floats should just clear the horizontal portion of gauge Vertical distance (B) between top of float and machined surface of casting must be 5/32 inch (Gauge T109-236) for both primary and secondary floats Adjust by bending float arms

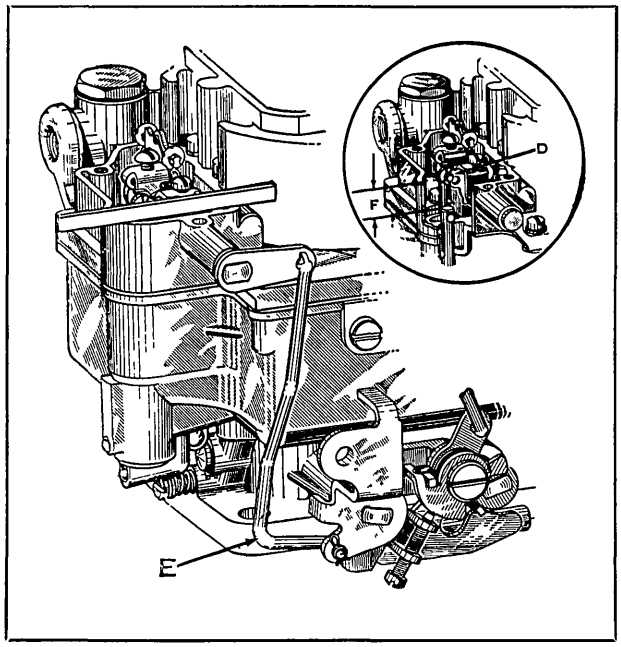

Figure 3
Pump Adjustment

PUMP ADJUSTMENT (Fig. 3):

Install pump connector link in outer hole (long stroke) of pump arm (D), with ends extending toward countershaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at lower angle (E). (Use tool T109-213.)

Optional Adjustment: With throttle valves seated in bores of carbureter, the distance from the top of the plunger shaft to the top of the dust cover boss should be 18/64 inch (F). Adjust as mentioned above.

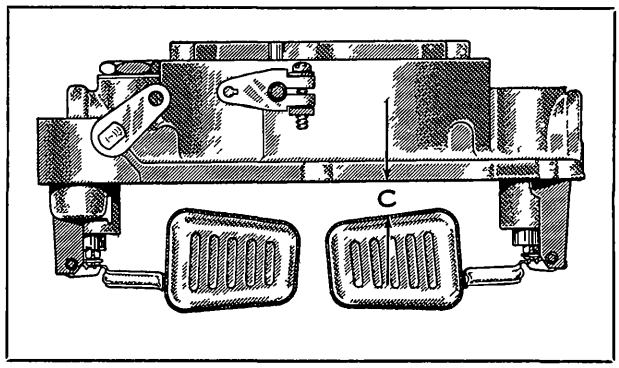

Figure 2
Float Drop Adjustment

FLOAT DROP ADJUSTMENT (Fig. 2):

With bowl cover held in upright position and measuring from center of floats (C) the distance between top of floats and bowl cover should be 5/8 inch for both primary and secondary floats Adjust by bending stop tabs on float brackets

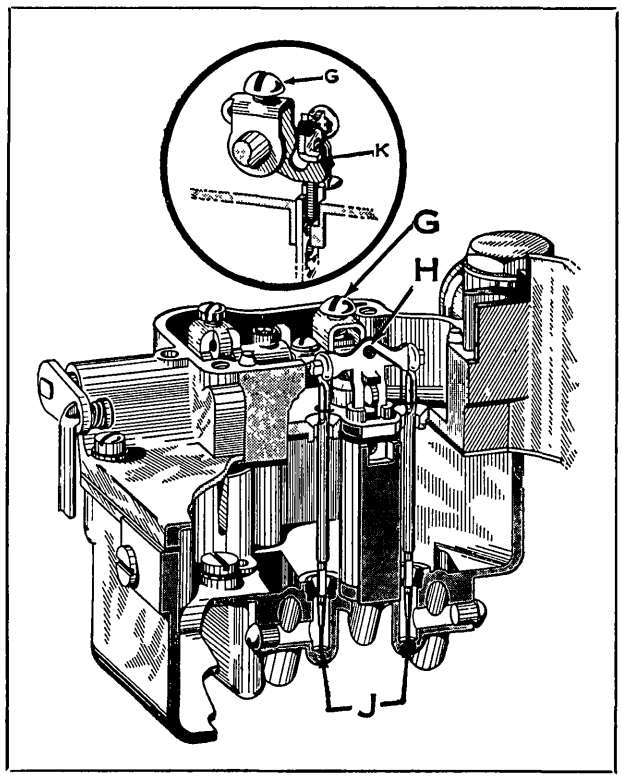

Figure 4
Metering Rod Adjustment

METERING ROD ADJUSTMENT (Fig. 4):

Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw (G). 2. With metering rods in place, press down on vacumeter link (H) until metering rods bottom in carbureter body casting (J). 3 Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link (K) Hold in place and carefully tighten clamp screw (G).

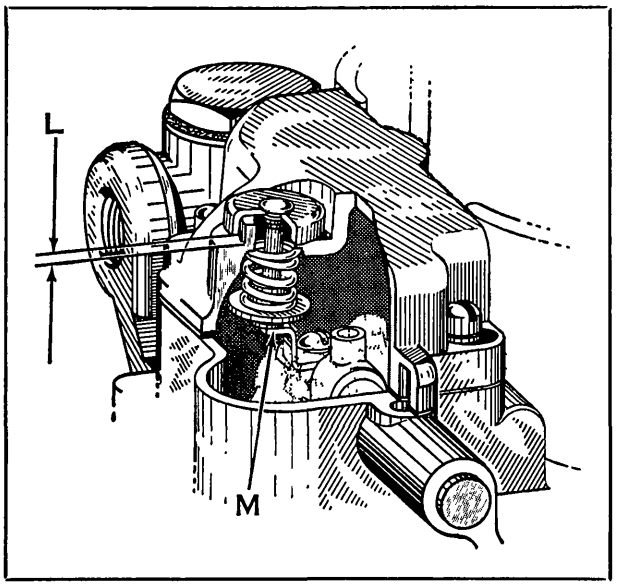

Figure 5
Bowl Vapor Vent Adjustment

BOWL VAPOR VENT ADJUSTMENT (Fig. 5):

This adjustment should be made after completing pump and metering rod adjustments. Install dust cover and dust cover gasket. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter. There should be 3/32 inch (L) (gauge T109-125) between lower edge of bowl vapor vent valve and dust cover. To adjust remove dust cover and bend vapor vent arm (M).

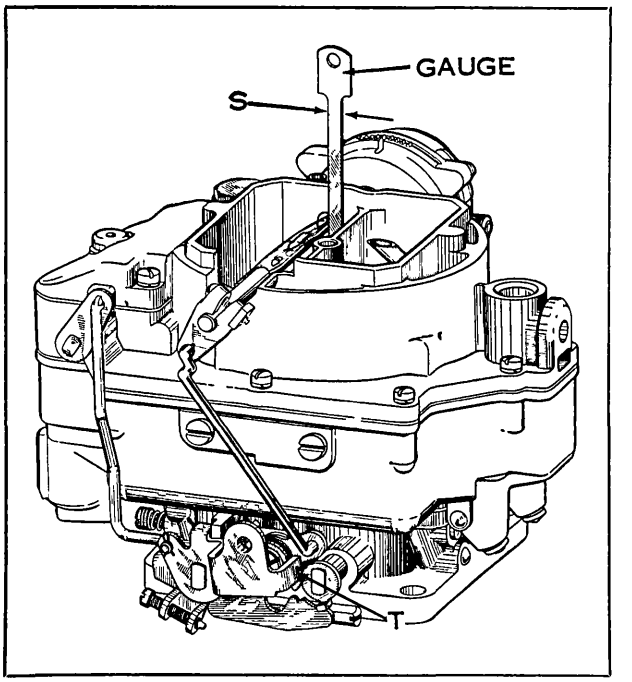

Figure 7
Unloader Adjustment

UNLOADER ADJUSTMENT (Fig. 7):

With throttle wide open there should be 9/32 inch (Gauge T109-126) clearance (S) between upper edge of choke valve and inner wall of air horn. Adjust by bending unloader lip (T) on throttle shaft lever (use bending tool T109-41).

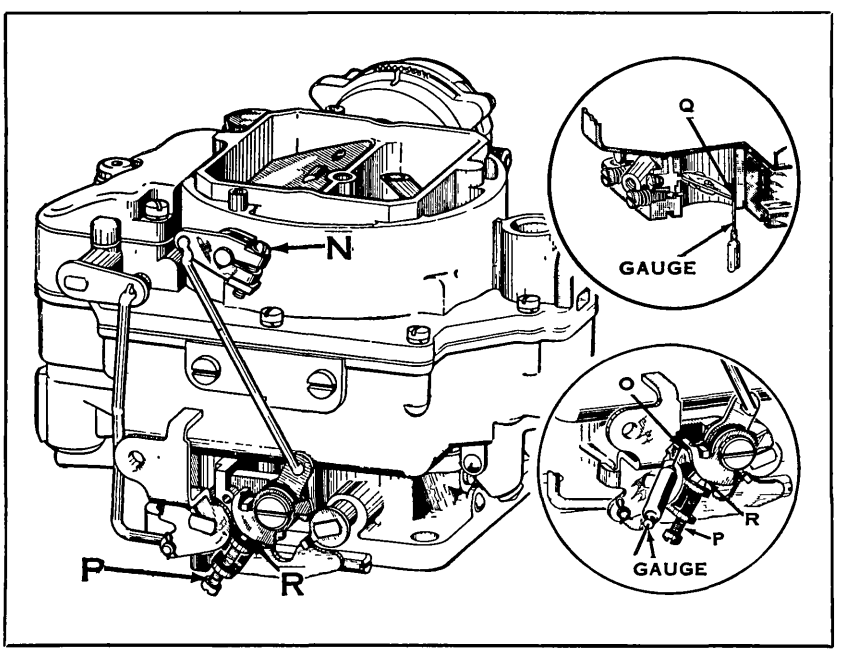

Figure 6
Fast Idle Adjustment

FAST IDLE ADJUSTMENT (Fig. 6):

(a) Loosen choke lever clamp screw (N) on choke shaft. Insert .020" feeler gauge (T109-29) between lip of fast idle cam and boss of flange casting (O). Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw (N). (b) With choke valve tightly closed, tighten fast idle adjusting screw (P) until there is .020 inch (Gauge T109-29) opening between throttle valve and bore of carbureter (side opposite idle port) (Q). Be sure fast idle adjusting screw is on high step of cam (R) while making this adjustment.

192-21U	Carter starter switch unit	
192-28S	Carter starter switch complete	

NOTE Figures in parentheses indicate number of pieces used in one carbureter Where no figure is shown only one is used

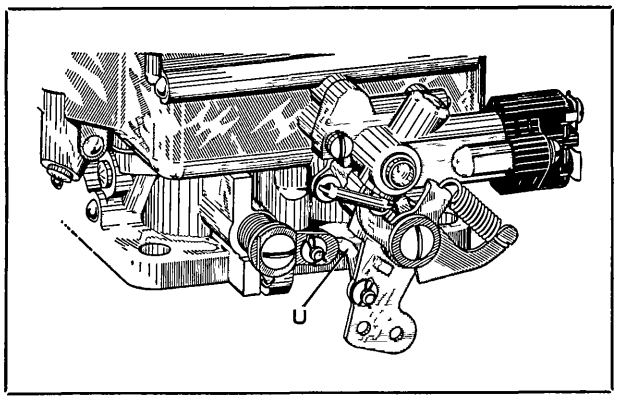

Figure 8
Secondary Throttle Lever Adjustment

SECONDARY THROTTLE LEVER ADJUSTMENT (Fig. 8):

Primary and secondary throttle valves should reach wide open position at the same time To adjust Bend throttle operating rod at upper angle (U) (Use bending tool T109-213)

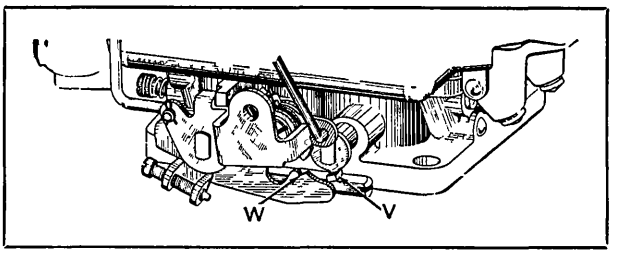

Figure 9
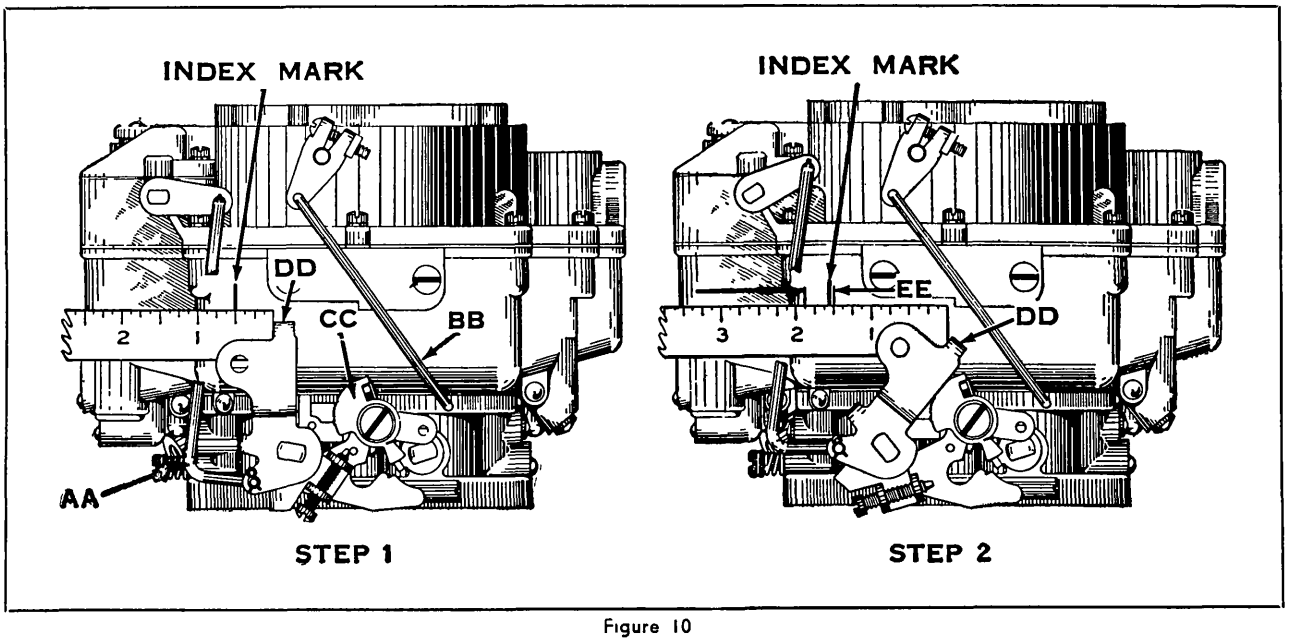
Secondary Throttle Lock-Out Adjustment

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT (Fig. 9):

This adjustment should be made after completing fast idle and secondary throttle lever adjustments (a) With choke valve tightly closed, open primary throttle valves all the way Tang (V) on secondary throttle arm should engage in notch (W) on lock out lever preventing secondary throttle shaft movement (b) Hold choke valve in wide open position Open primary throttle valves all the way. Lock-out lever should fall free allowing secondary throttle valves to be opened before primary throttle valves are fully open. If necessary, bend tang (V) on secondary throttle lever to provide clearance for proper operation of lock-out lever.



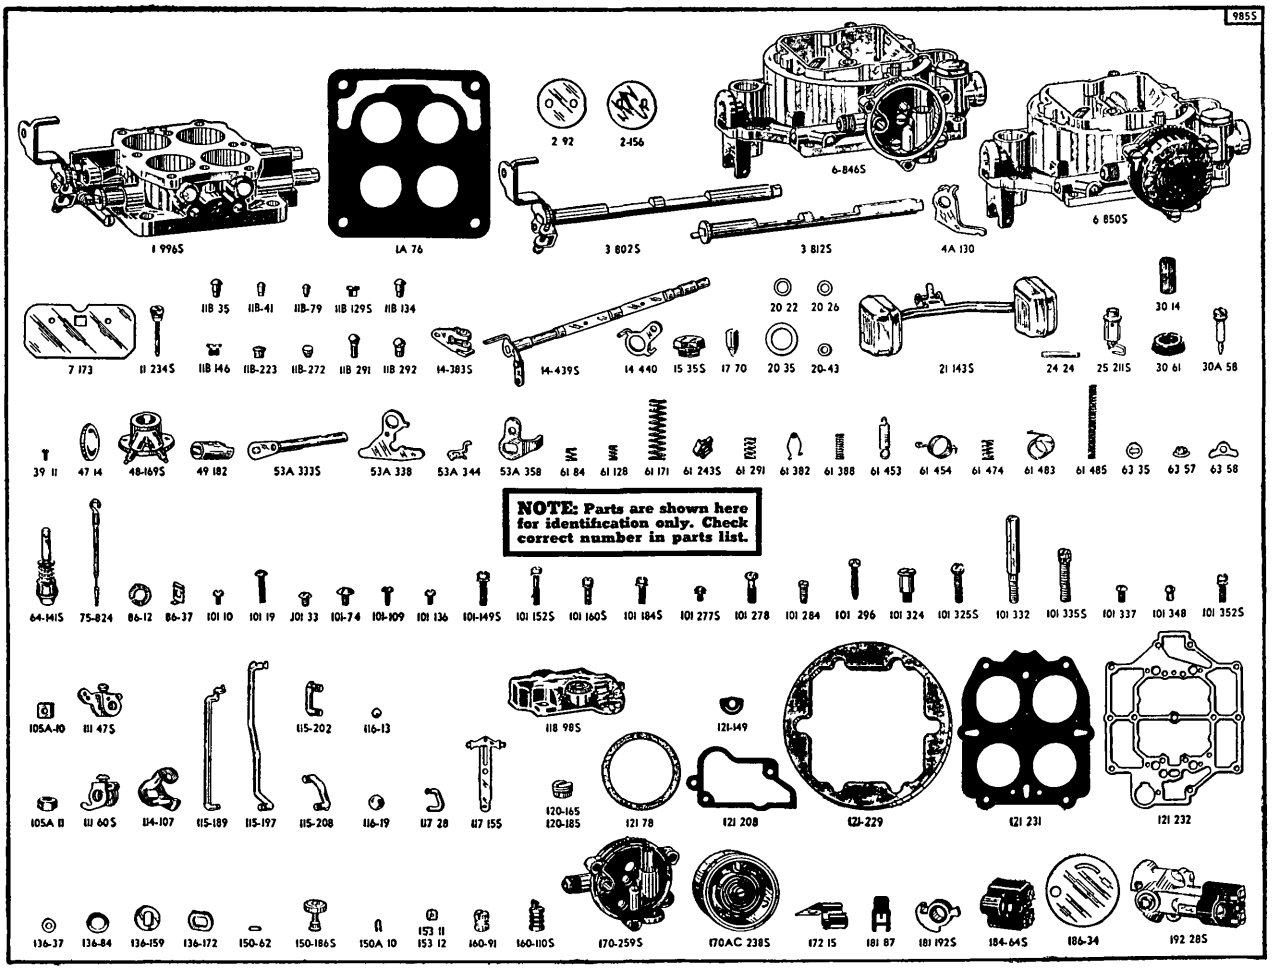


Figure 10
Checking and Adjusting Starter Switch

CHECKING AND ADJUSTING STARTER SWITCH (Fig. 10):

Connect a 6-volt battery and test lamp across switch terminal, so that lamp will light when switch makes contact. 1. Back off throttle stop screw, remove throttle connector rod (AA) and choke connector rod (BB), rotate fast idle cam (CC) to slow idle position, and fully close the throttle valves. 2. While holding throttle valves fully closed, place a scale against choke unloader arm of throttle lever and make an index mark on carbureter body at the 1/2 inch division of scale. 3. With test lamp connected hold end of scale against unloader arm (DD) and slowly open throttle until test lamp lights. 4. If switch is correctly timed, the scale will then read between 1 1/2 and 1 7/8 inch at mark on carbureter body (EE) (1 inch to 1 3/8 inch travel of arm). 5. If necessary, make switch adjustment by reducing or increasing the total thickness of the brass shims If switch timing was found to be too early, reduce the total thickness of the shims. If timing was too late, increase total thickness of shims. Two sizes of shims are available: 153-11 .018 inch—153-12 .006 inch.

Packard 8—1953—Carbureter No. 985S

Casting No. 803 on face of flange

PACKARD EIGHT 1951

(928S can also be used)

WGD Dual Down-Draft Climatic® Control Carbureter—**No. 767S**

CARBURETER SPECIFICATIONS

For Packard 8 Cylinder Engine: 3½ Inch Bore, 4¼ Inch Stroke

Dimensions: Flange size, 1¼ inch dual 4 bolt type
Primary venturi, 11/32 inch I D.
Secondary venturi, 21/32 inch I D
Main venturi, 1-3/16 inch I D

Float Level: Distance from float to bowl cover when needle is seated to be 13/64 inch Use gauge No T109-39

Vents: Inside, none Outside vent, No 10 (1935") drill

Gasoline Intake: Square vertical (push-pull) needle, seat size No 42 drill

Low Speed Jet Tube: Jet size, No 67 (032") drill
By-pass, size No 55 (052") drill
Economizer, size 1.15 mm (045") drill
Idle bleed, size No 56 (0465") drill

Idle Ports: Upper port, slot type, length 187 inch Width 030 inch

Idle Port Opening: 135 to 141 inch above upper edge of valve with valve closed tight

Lower Port (for Idle Adjustment Screw): Size 0615 to 0655 inch diameter

Set Idle Adjustment Screw: ½ to 1½ turns open For richer mixture turn screw out. Do not idle engine above 400 r p m on ultramatic transmission or above 450 r p m on standard transmission

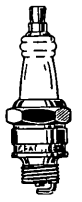
Nozzle: In primary venturi, angle 45°. Nozzle is installed permanently **Do not remove.** Anti percolating well, plug jet size, No 66 drill Anti-percolating well to idle passage restriction size No 68 (031") drill

Metering Rod (Vacumeter Type): Economy step, 0685 inch diameter Middle step tapers to 066 inch diameter Power step 057 inch diameter Length 2-59/64 inches

Metering Rod Jet: 089 inch diameter

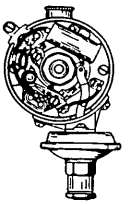
Metering Rod Setting: After adjusting for pump stroke set metering rod as follows With throttle tightly closed, hold metering rods (assembled on vacumeter link) in maximum down position, tighten clamp screw securely with metering rod arm contacting vacumeter link

Accelerating Pump: Pressure type delayed action plunger (non adjustable lever) Discharge jet (twin) size No 74 drill Intake ball check size No 40 (098") drill Discharge (needle seat) size No 50 (.070") drill



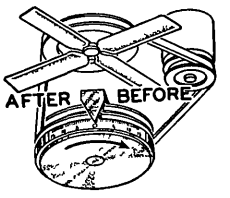
Pump Adjustment: "42" as indicated on gauge T109-117S with throttle valves seated in bores of carbureter or 15/32 inch from top of dust cover boss to top of plunger shaft

Choke: Carter Climatic® Control set one point rich Butterfly type offset valve Choke heat suction hole size No 36 drill



Vacuum Spark Port: 103 to 105 inch diameter Top of port 052 to 062 inch above valve

Motor Tune-Up—Be Accurate!



CAUTION Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: With bowl cover gasket removed, bowl cover inverted and needle seated, there should be 13/64 inch (gauge T109-39) between top of float and bowl cover Adjust by bending float arm

PUMP ADJUSTMENT: Back out throttle lever set screw until throttle valves seat in bores of carbureter Place Universal pump travel gauge T109-117S inverted on edge of dust cover boss of bowl cover. Turn knurled nut of gauge

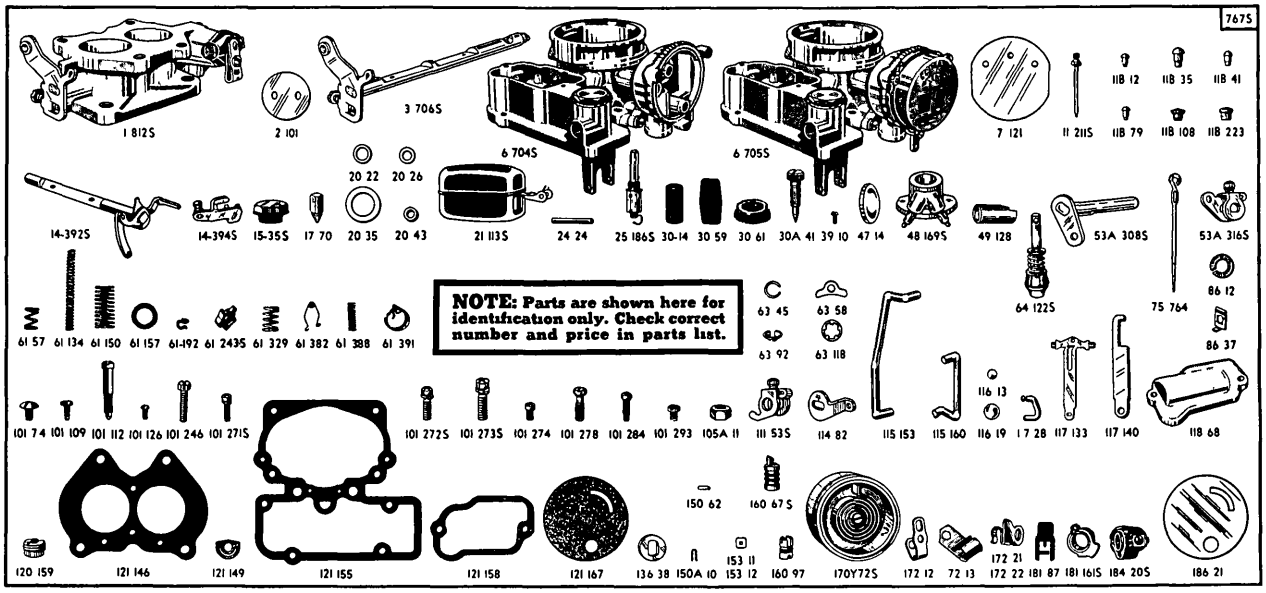
CARBURETER
TRADE MARK REG U S PAT OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.

until finger on gauge just touches top of plunger shaft Number indicated on gauge should be ' 42 Adjust by bend ing throttle connector rod at upper angle



Optional Adjustment The distance from the dust cover boss to the top of the plunger shaft should be 15/32' Adjust as mentioned above

METERING ROD ADJUSTMENT The metering rods must be adjusted after the pump adjustment or when leaner than standard rods are installed No metering rod gauges are necessary procedure is as follows With the throttle lever set screw backed out and throttle valves seated in bores of carbureter, press down on vacumeter link until metering rods bottom With rods held in this position, revolve meter ing rod arm until lip contacts vacumeter link Hold in place and carefully tighten metering rod arm set screw

FAST IDLE ADJUSTMENT With the thermostatic coil housing, gasket and baffle plate removed, crack throttle valve and hold choke valve closed Then close throttle There should now be 023" clearance (guage T109-189) between throttle valve and bore of carbureter (side opposite idle port) Adjust by bending the choke connector rod at lower angle

UNLOADER ADJUSTMENT Must be made after fast idle adjustment Hold throttle valve wide open and close choke valve as far as possible without forcing, there should now be 1/8 clearance between upper edge of choke valve and inner wall of air horn Adjust by bending arm on choke trip lever (tool T109-187)

STARTER SWITCH Adjustment should be made with Carter tool No T109-155S obtainable from your Carter distributor, with complete instructions Switch must make contact between 30° and 45° throttle opening

Packard 8—1951—Carbureter No. 767S

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT (Fig 1)

With bowl cover gasket removed bowl cover inverted and needle seated there should be 13/64 inch (gauge T109 39) between top of float and bowl cover

Adjust by bending float arm

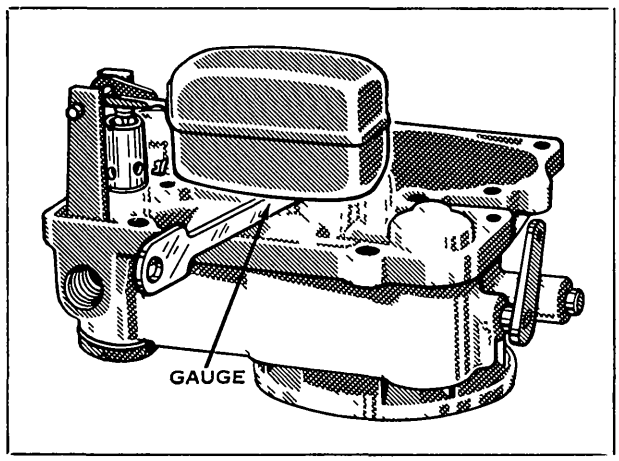

Figure 1
Float Adjustment

PUMP ADJUSTMENT (Fig 2)

Back out throttle lever set screw until throttle valves seat in bores of carbureter Place Universal pump travel gauge T109 117S inverted on edge of dust cover boss of bowl cover Turn knurled nut of gauge until finger on gauge just touches top of plunger shaft (A) Number indicated on gauge should be 42

Adjust by bending throttle connector rod at upper angle (B)

Optional Adjustment The distance from the dust cover boss to the top of the plunger shaft should be 15/32" Adjust as mentioned above

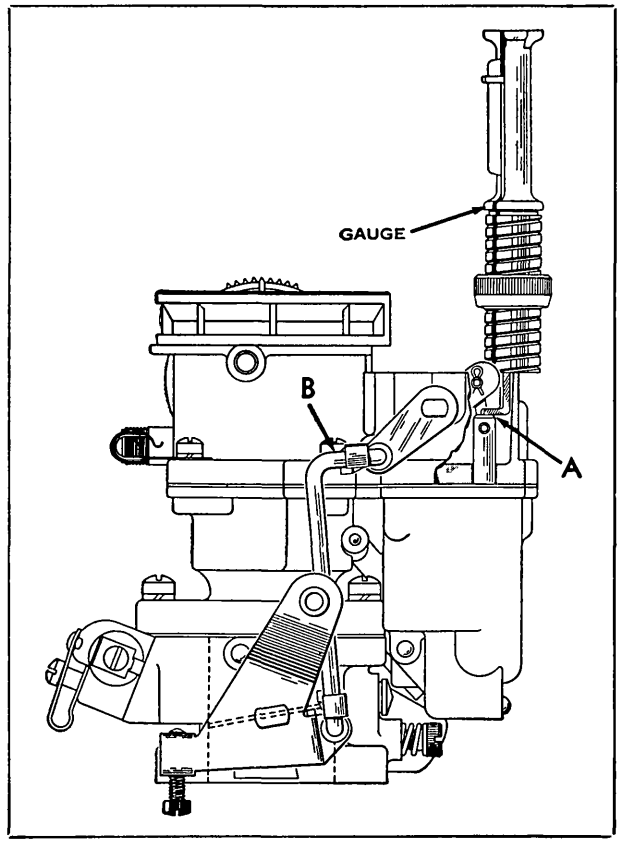

Figure 2
Pump Adjustment

METERING ROD ADJUSTMENT (Fig 3)

The metering rods must be adjusted after the pump adjustment or when leaner than standard rods are installed No metering rod gauges are necessary procedure is as follows With the **throttle lever** set screw backed out and throttle valves seated in bores of carbureter press down on vacumeter link (D) until metering rods bottom With rods held in this position revolve metering rod arm until lip contacts vacumeter link (E) Hold in place and carefully tighten metering rod arm set screw (F)

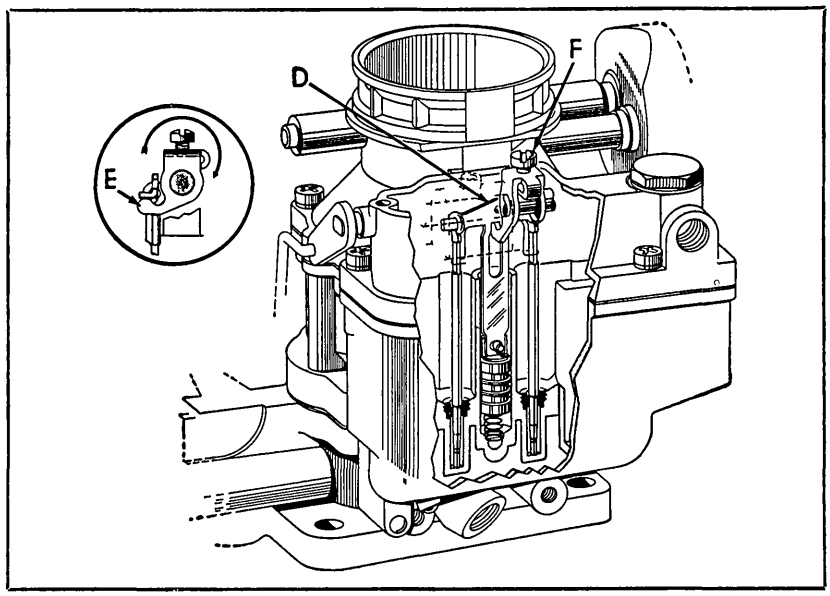

Figure 3
Metering Rod Adjustment

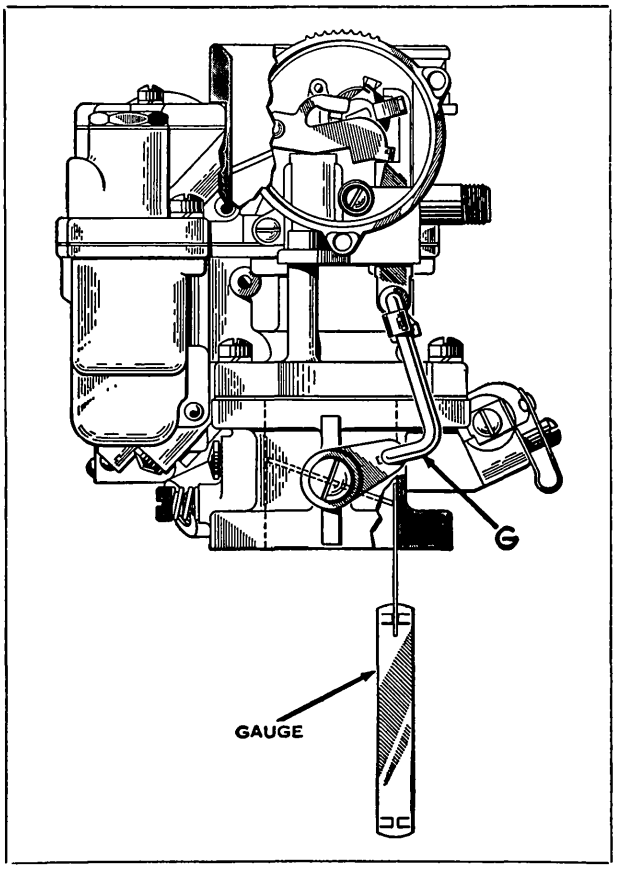

Figure 4
Fast Idle Adjustment

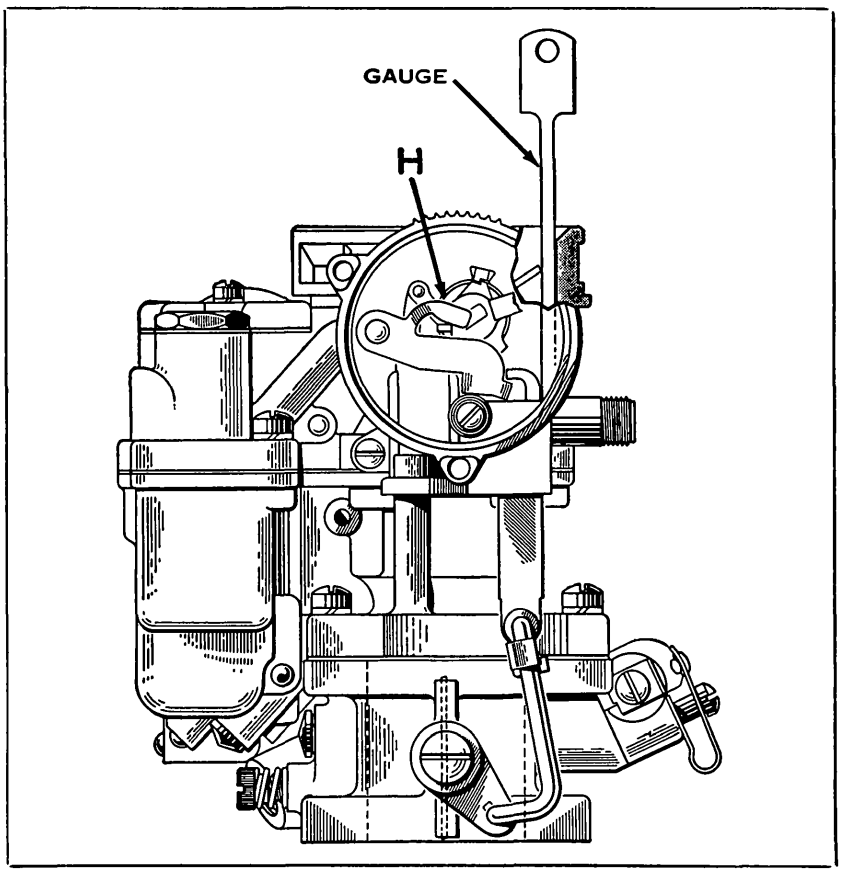
FAST IDLE ADJUSTMENT (Fig. 4):

With the thermostatic coil housing, gasket and baffle plate removed, crack throttle valve and hold choke valve closed Then close throttle. There should now be .026" clearance (gauge T109-189) between throttle valve and bore of carbureter (side opposite idle port).

Adjust by bending the choke connector rod at lower angle (G).

UNLOADER ADJUSTMENT (Fig. 5):

Must be made after fast idle adjustment. Hold throttle valve wide open and close choke valve as far as possible without forcing; there should now be 1/8 inch clearance between upper edge of choke valve and inner wall of air horn. Adjust by bending arm (H) on choke trip lever (tool T109-187)



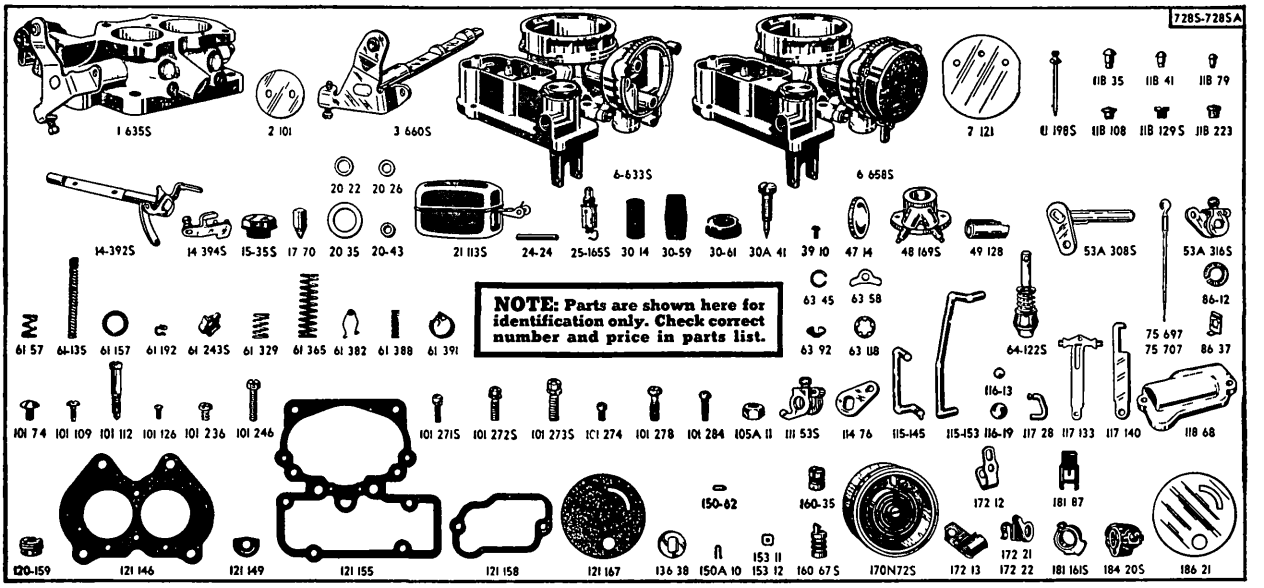


Figure 5
Unloader Adjustment

Idle bleed size No 54 drill

Idle Ports Upper port slot type length 180 inch width 030 inch
Opening 127 to 133 inch above upper edge of valve with valve closed tight
Lower Port (For Idle Adjustment Screw) Size 0615 to 0655 inch diameter

Set Idle Adjustment Screw ⅝ to 1⅛ turns open For richer mixture turn screw out Do not attempt to idle engine below 350 r p m

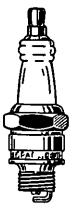
Main Nozzle In primary venturi angle 45° Closed tip
Inside diameter No 30 drill
Upper hole 028 inch diameter on 45° angle
Lower hole 0635 inch diameter on 60° angle

Metering Rod (Vacumeter Type) Economy step 064 inch diameter
Middle step tapers to 060 inch diameter
Power step 045 inch diameter
Length of rod 2 59/64 inches

Metering Rod Jet 0846 inch diameter

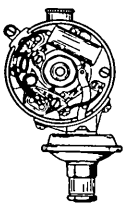
Metering Rod Setting Use gauge part No T109 113 (2 280 inches)

Accelerating Pump High pressure type (spring operated lever)
Pump discharge jets (twin) No 70 drill
Intake ball check size No 40 drill
Discharge (needle seat) size No 50 drill
Outside relief to pump jet none



Pump Adjustment 14/64" plunger travel (full throttle position) Use gauge T109 117S

Choke Carter Climatic® Control set at index Butterfly type, offset valve Choke heat suction hole in body size No 37 (104") drill



Vacuum Spark Port 103 to 105 inch diameter Top of port 060 inch above valve

Motor Tune-Up—Be Accurate!

CARBURETER ADJUSTMENTS

PUMP ADJUSTMENT With pump connector link in inner hole and throttle adjustment screw backed out, pump plunger should travel 14/64" from closed to wide open throttle position Measure pump travel by placing gauge T109-117S on raised portion of bowl cover around the plunger shaft Projecting portion of indicator should be placed on top surface of connector link where it extends through the plunger shaft The difference between readings at wide open and closed throttle positions should be "14" (14/64") Adjust by bending throttle connector rod at lower angle

METERING ROD ADJUSTMENT. Must be made when reassembling carbureter or when leaner than standard rods are installed Do not disturb pump adjustment Procedure is as follows (a) Back out throttle lever adjustment screw until throttle valves seat Insert one metering rod gauge T109-113 in place of metering rod Be sure gauge seats in jet (b) Install metering rod pin and pin spring in vacuum piston and link assembly (c) Press lightly on top of vacuum piston ink until lip contacts tongue on anti-percolator arm There should now be less than 005" clearance between metering rod pin and shoulder in notch of gauge with throttle valves seated

Adjust by bending tongue on pump arm Remove gauge and metering rod pin and install metering rods, discs, spring, and metering rod pin, and hook spring to metering rod Vacuum piston and link must not bind or drag in any position

ANTI-PERCOLATOR ADJUSTMENT After adjusting pump and metering rods, and with throttle valves seated, insert 015" flat feeler gauge T109-72 between anti-percolator stems and lips on anti-percolator arm Center of indicator lines must be flush with top of anti-percolator plug Adjust by bending lips, be sure both valves are adjusted evenly

UNLOADER ADJUSTMENT With throttle wide open, distance between upper edge of choke valve and inner wall of air horn should be 11/64" (gauge T109-166) Adjust by bending lip on fast idle connector link When unloader is adjusted properly with throttle valve wide open move choke valve to wide open position and choke valve will lock in open position

PRINTED IN U.S.A.

FAST IDLE ADJUSTMENT: Hold choke valve tightly closed and adjust fast idle arm screw until there is .020" (T109-29) clearance between edge of throttle valve and bore of carbureter, side opposite idle port

FLANGE ASSEMBLY: Assemble 1-562S in the following manner in order to center throttle valves properly and eliminate excessive endplay in the throttle shaft. Install throttle shaft and lever assembly and place throttle shaft retaining ring firmly on stub of shaft with prongs extended outward. Take out all endplay by pressing retaining ring on shaft as far as possible. Then install throttle valves with "c" in circle toward the idle port when viewed from the manifold side. To center valves tap lightly holding in place with fingers while tightening screws

STARTER SWITCH: The Carter starter switch must be qualified with Carter protractor gauge T109-155S. Switch must make contact between 30° and 45° throttle opening. When qualifying the starter switch, do not use more than three 153-11 (.018" shim) and two 153-12 (.006" shim) and not less than one 153-11 shim

WDO Dual Down-Draft Climatic® Control Carbs — **Models 643S-643SA** (Super 8)

CARBURETER SPECIFICATIONS

For Packard (Super) 8 Cyl Eng 3½" Bore 4¼" Stroke

Dimensions Flange size 1¼ inch dual 4 bolt type
Primary venturi 11/32 inch
Secondary venturi 19/32 inch
Main venturi 1 7/32 inch

Float Level Distance from float bowl cover when needle is seated to be 5/32 inch (Use gauge No T109 154)

Vents Outside No 10 drill—four holes Inside none

Gasoline Intake Square vertical needle Size No 38 drill hole in needle seat

Low Speed Jet Tube Jet size No 70 drill
By pass size No 52 drill
Economizer size No 50 drill
Idle bleed size No 52 drill

Idle Ports Upper port slot type length 180 inch width 030 inch
Opening 127 to 133 inch above upper edge of valve with valve closed tight
Lower Port (For Idle Adjustment Screw) Size 0615 to 0655 inch diameter

Set Idle Adjustment Screw ¾ to 1¼ turns open For richer mixture turn screw out Do not attempt to idle engine below 350 r p m

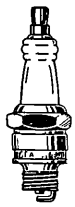
Main Nozzle In primary venturi angle 45° Closed tip
Inside diameter No 30 drill
Upper hole 0292 inch diameter on 45° angle
Lower hole 0635 inch diameter on 60° angle

Metering Rod (Vacumeter Type) Economy step 0655 inch diameter
Middle step tapers to 0585 inch diameter
Power step 051 inch diameter
Length of rod 2 59/64 inches

Metering Rod Jet 2 3 mm (09055 inch) diameter

Metering Rod Setting Use gauge part No T109 113 (2 280 inches)

Accelerating Pump High pressure type (spring operated lever)
Pump discharge jets (twin) size No 72 drill
Intake ball check size No 40 drill
Discharge (needle seat) size No 50 drill
Outside relief to pump jet none



Pump Adjustment 28/64" plunger travel (full throttle position) Use gauge T109 117S

Choke Carter Climatic® Control set at index Butterfly type offset valve Choke heat suction hole in body size No 37 (104) drill

Vacuum Spark Port (643S) 054 056 inch diameter (643SA) 103 to 105 inch diameter Top of port (643S) 050 to 054 inch above valve (643SA) 060 inch above valve

CARBURETER SPECIFICATIONS

For Packard 8 Cylinder Engine· 3½ Inch Bore, 4⅝ Inch Stroke

Dimensions Flange size 1¼ inch dual 4 bolt type
Primary venturi 11/32 inch
Secondary venturi 19/32 inch
Main venturi 1-7/32 inch

Float Level· Distance from float bowl cover when needle is seated to be 5/32 inch (Use gauge No T109-154)

Vents Outside No 10 drill—four holes Inside none

Gasoline Intake Square vertical needle Size No 38 drill hole in needle seat

Low Speed Jet Tube· Jet size No 70 drill
By pass size No 52 drill (Early production)
By pass size No 53 drill (Later production)
Economizer, size No 50 drill
Idle bleed size No 52 drill

Idle Ports Upper port slot type length 190 inch width 030 inch
Opening 152 to 158 inch above upper edge of valve with valve closed tight
Lower Port (For Idle Adjustment Screw) Size 0615 to 0655 inch diameter

Set Idle Adjustment Screw 1½ to 2 turns open For richer mixture turn screw out Do not attempt to idle engine below 350 r p m

Main Nozzle In primary venturi angle 45° Closed tip
Inside diameter No 30 drill
Upper hole 037 inch diameter on 45° angle
Lower hole 071 inch diameter on 60° angle

Metering Rod (Vacumeter Type): (531S) Economy step, 064 inch diameter
Middle step tapers to 057 inch diameter
Power step 054 inch diameter
Length of rod 2-59/64 inches
(531SA) Economy step 0665 inch diameter
Middle step tapers to 060 inch diameter
Power step, 056 inch diameter
Length of rod 2-59/64 inches

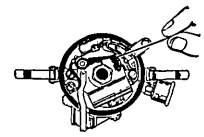
Metering Rod Jet 2 3 mm (09055 inch) diameter

Metering Rod Setting Use gauge part No T109 113 (2 280 inches)

Accelerating Pump High pressure type (spring operated lever)
Pump discharge jets (twin) size No 72 drill
Intake ball check size No 40 drill
Discharge (needle seat) size No 50 drill
Outside relief to pump jet none

Pump Adjustment: 26/64 inch plunger travel (full throttle position) short stroke Use gauge T109 117S

Choke: Carter Climatic® Control, set at index Butterfly type offset valve Choke heat suction hole in body size No 37 (104") drill



Vacuum Spark Port 054 to 056 inch diameter Top of port to be 047 to 057 inch above valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter

BRIEF CARBURETER ADJUSTMENTS

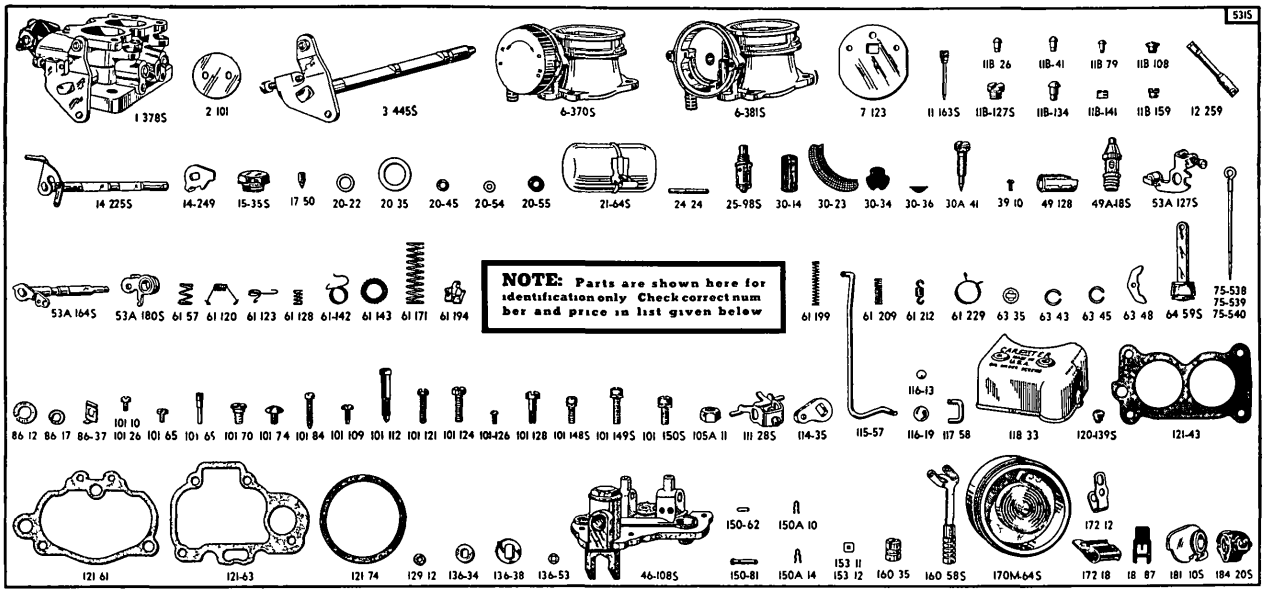
PUMP ADJUSTMENT: With pump connector link in inner hole (short stroke) and throttle adjustment screw backed out to allow throttle valves to seat in bores of carbureter, pump plunger should travel 26/64" from closed to wide open throttle position Pump travel can be measured by placing gauge T109-117S on rim of bowl cover around the plunger shaft and measuring to top surface of connector link where it extends through the plunger shaft The difference in reading obtained at closed and wide open throttle position should be "26' (26/64" plunger travel)

Adjust by bending the throttle connector rod at lower angle

METERING ROD ADJUSTMENT: Should be made when reassembling carbureter or when leaner than standard rods are installed (Do not disturb pump adjustment) Correct setting of metering rods is important Procedure is as follows

A Insert one metering rod gauge T109-113 in place of metering rods Be sure gauge seats in metering rod jet
B Install metering rod pin and pin spring in vacuum piston and link assembly
C Press lightly on top of vacuum piston link until lip on link contacts lip on anti-percolator arm There should now be less than 005' clearance between metering rod pin and shoulder in notch of gauge
D Adjustment should be made by bending lip on anti-percolator arm (use tool T109-105)
E Remove gauge and metering rod pin and install metering rods, discs, spring, pin and pin spring, and hook spring to metering rods

ANTI-PERCOLATOR ADJUSTMENT Should be made after pump and metering rod adjustments Back out throttle lever adjusting screw so that throttle valves seat in bores of carbureter With throttle valve seated insert 015" feeler gauge (T109-72) between anti-percolator stem and lips on anti-percolator arm Then bend lips so that center of indicator lines are just flush with top of anti-percolator plug Care should be taken so there is an even adjustment made on both anti-percolator lips



UNLOADER ADJUSTMENT With throttle wide open, distance between upper edge of choke valve and inner wall of air horn should be 11/64" (Use gauge T109-166) Adjustment can be made by bending lip on fast idle connector link With throttle wide open, push choke valve open Choke should lock within 5° of wide open position If it does not lock, recheck unloader adjustment Closing the throttle will

release choke valve Choke trip lever is notched out for this setting

FAST IDLE ADJUSTMENT: Hold choke valve tightly closed and adjust fast idle arm screw to giv 023" to 028" opening between edge of throttle valve and bore of carbureter, side opposite port (Use gauge T109-189)

STARTER SWITCH Adjustment should be made with Carter tool No T109-155S, obtainable from your Carter distributor with complete instructions Switch must make contact between 30° and 45° throttle opening

Packard—1942-50—Carbureters Nos. 531S-531SA

WHEN SERVICING, USE GASKET ASSORTMENT No. 156, REPAIR PACKAGE No 1321D

WA1 Down-Draft Vacumeter Climatic® Control Carbureter—**Model 530S**

CARBURETER SPECIFICATIONS

For Packard Six Cylinder Engine: 3½ Inch Bore, 4¼ Inch Stroke

Dimensions: Flange size, 1¼ inch S.A.E.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 11/16 inch I. D
Main venturi, 1-5/16 inch I. D.

Float Level: Distance from seam of float (at free end) to tip on lower edge of float chamber cover, when needle is seated to be ⅜ inch

Vents: Outside, No 10 drill. Inside, none.

Gasoline Intake: Square vertical needle. Size No. 38 drill in needle seat

Low Speed Jet Tube: Jet size No. 65 drill
By-pass, size No 53 drill.
Economizer 073 inch diameter.
Idle bleed, size No. 50 drill

Idle Port: Slot type length .200 inch. Width 030 inch
Opening 158 to 162 inch above upper edge of valve with valve closed tight

Idle Screw Seat: No 46 drill

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture turn screw out Do not attempt to idle engine below 350 r p m

Main Nozzle: In primary venturi, angle 45°. Closed tip Inside diameter No. 30 drill
Upper hole: No. 68 drill on 45° angle.
Lower hole: No 45 drill on 60° angle.

Metering Rod (Vacumeter Type): Economy step, 076 inch diameter. Middle step tapers to .065 inch diameter Power step .040 inch diameter. Length 3-9/64 inches

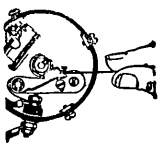
Metering Rod Jet: .1015 inch diameter.

Metering Rod Setting: Use gauge, part No. T109-102 (2.468 inches).

Accelerating Pump: High pressure type (spring operated lever), with no seasonal adjustment
Discharge jet, size No. 72 drill
Intake ball check size No. 40 drill.
Discharge ball check, size No 32 drill.
Relief passage to outside size No 42 drill

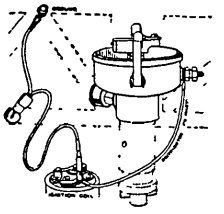
Pump Adjustment: 16/64 inch plunger travel (full throttle position). Use gauge No. T109-117S

Choke: Carter Climatic® Control, set at index Butterfly type, offset valve. Choke heat suction hole, in body size No 37 (104 inch) drill

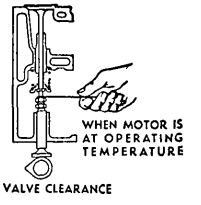


Vacuum Spark Port: 061 to .064 inch diameter. Bottom of port, 022 to 027 inch above valve

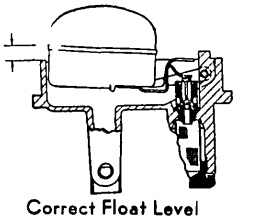
Motor Tune-Up—Be Accurate!



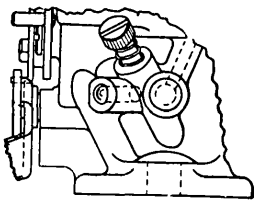
CAUTION Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter



Spark Plug Gap 028" ± 0025"



Set Breaker Points .018"-.022"



Use Timing Light Set Timing 4° (Plus 0°, Minus 1½°) B.T.D.C

Set Valves
Intake 007"
Exhaust 010"

Correct Float Level (Measure from machined surface of small projection to top of seam) ⅜ Inch

Idle Adjustment Screw Setting ½ to 1½ Turns Open

BRIEF CARBURETER ADJUSTMENTS

PUMP ADJUSTMENT: With throttle valve seated and connector link in place, pump plunger should travel 16/64" from closed to wide open position. Pump travel can be measured by using the universal pump travel gauge T109-117S, placing base of gauge on ridged portion of bowl cover so that indicator lip of gauge contacts top surface of connector link where it extends through plunger shaft. Hold gauge vertical Turn knurled nut of gauge until lip just contacts connector link. The difference between the numbers shown on gauge at wide open and closed throttle should be "16", (16/64' plunger travel.)

METERING ROD ADJUSTMENT: Correct setting of metering rod is important and must be made after pump adjustment Insert gauge (No T109-102) in place of metering rod, seating tapered end in metering rod jet Hold gauge vertical to insure seating With throttle valve seated, press down lightly on piston link directly over piston until lip on link contacts pin on pump arm. There should be less than 005" clearance between metering rod pin and shoulder in notch of gauge. Gauge must not drag on pin Adjustment can be made by bending lip on piston link. Remove gauge and install metering rod and disc. Connect metering rod and spring

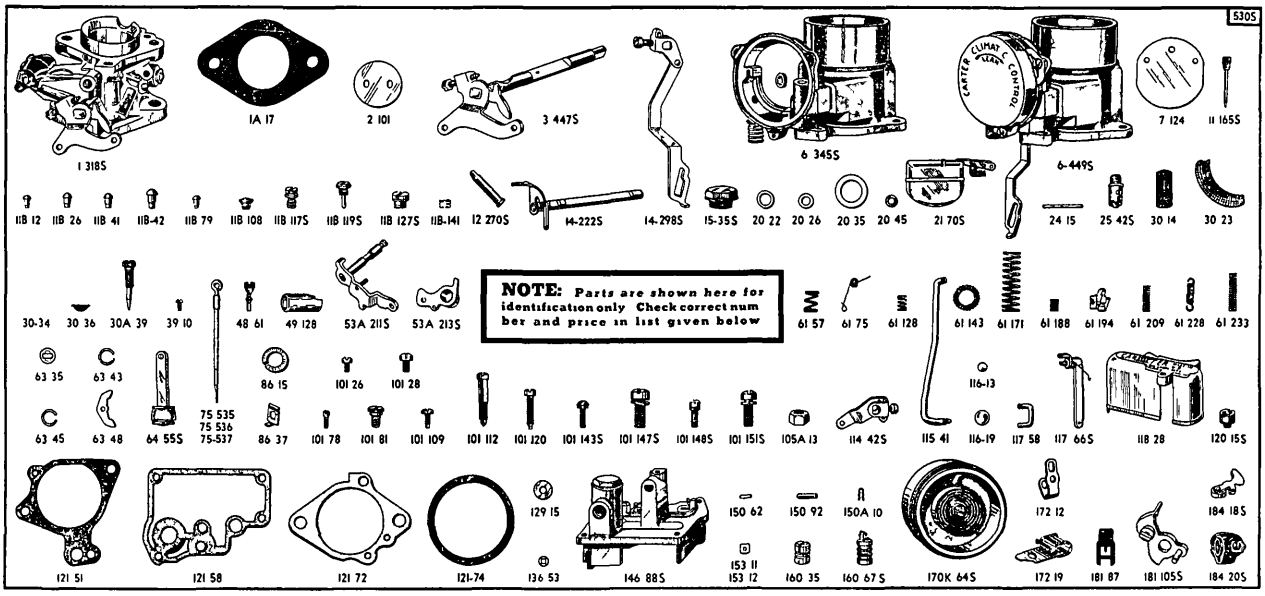
CARBURETER
TRADE MARK REG. U. S PAT. OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.

ANTI-PERCOLATOR ADJUSTMENT: Crack throttle valve .030" by placing gauge T109-29 between valve and bore of carbureter (side opposite port) Bend rocker arm (use tool T109-105) until there is a clearance of .005" to .015" between rocker arm and pump arm



FAST IDLE ADJUSTMENT. With fast idle cam held in normal idle position, tighten throttle lever adjusting screw until it just seats against cam Hold throttle lever closed and pull cam back until first (or lower) step on cam is against (not on) set screw

There should now be 5/64" clearance between inside wall of air horn and lower edge of choke valve (Use tool T109-85) Adjustment can be made by bending at offset portion of fast idle link (Use tool T109-41)

UNLOADER ADJUSTMENT: With throttle valve wide open there should be 7/16" clearance between lower edge of choke valve and inner wall of air horn (Use tool T109-81) Adjustment should be made by bending cam on throttle lever (Use tool T109-41)

LOCK-OUT ADJUSTMENT: With throttle and choke valves wide open, choke should lock in wide open position Adjustment should be made by bending lip at lower end of fast idle link to give 1/32" clearance between lip and throttle lever lock, with throttle and choke valves held wide open (Use tool T109-105)

STARTER SWITCH ADJUSTMENT: Adjustment should be made with Carter tool T109-155S, obtainable from your Carter distributor with complete instructions Switch must make contact between 30° and 45° throttle opening

WDO Dual Down-Draft Climatic® Control Carbureter—**Model 512S**

CARBURETER SPECIFICATIONS

For Packard 8 Cylinder Engine· 3¼ Inch Bore, 4¼ Inch Stroke

Dimensions: Flange size, 1 inch dual, 4 bolt type
Primary venturi, 11/32 inch
Secondary venturi 21/32 inch
Main venturi 1⅛ inch

Float Level: Distance from float bowl cover when needle is seated to be 5/32 inch (Use gauge No T109-154)

Vents: Outside No 10 drill—four holes Inside none

Gasoline Intake: Square vertical needle Size No 38 drill hole in needle seat

Low Speed Jet Tube: Jet size No 70 drill
By-pass size No 52 drill
Economizer, size No 50 drill
Idle bleed, size No 54 drill

Idle Ports· Upper port, slot type, length 165 inch, width 030 inch Opening 135 to 141 inch above upper edge of valve with valve closed tight
Lower Port (For Idle Adjustment Screw)
Size 0615 to 0655 inch diameter

Set Idle Adjustment Screw: ½ to 1½ turns open For richer mixture turn screw out Do not attempt to idle engine below 350 r p m

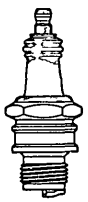
Main Nozzle: In primary venturi, angle 45° Closed tip Inside diameter No 30 drill
Upper hole 028 inch diameter on 45° angle
Lower hole 0635 inch diameter on 70° angle

Metering Rod (Vacumeter Type): Economy step, 064 inch diameter
Middle step tapers to 060 inch diameter
Power step, 050 inch diameter
Length of rod 2-59/64 inches

Metering Rod Jet: 2 15 mm (0846 inch) diameter

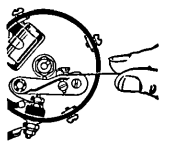
Metering Rod Setting: Use gauge part No T109-113 (2 280 inches)

Accelerating Pump: High pressure type (spring operated lever) with adjustable pump stroke
Pump discharge jets (twin) size No 70 drill
Intake ball check, size No 40 drill
Discharge (needle seat), size No 50 drill
Outside relief to pump jet none



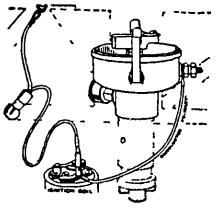
Pump Adjustment: 14/64 inch plunger travel (full throttle position) short stroke Use gauge T109-117S

Choke· Carter Climatic® Control, set at index Butterfly type, offset valve Choke heat suction hole, in body size No 32 (116") drill

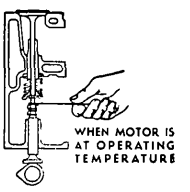


Vacuum Spark Port: 039 to 041 inch diameter Bottom of port 009 to 013 inch (early production), 012 to 022 inch (late production) above top edge of valve

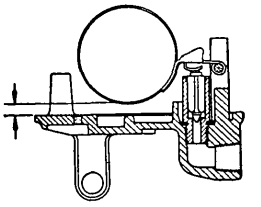
Motor Tune-Up—Be Accurate!



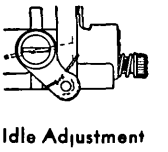
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .028" ± .0025"



Set Breaker Points 0125" to .0175"



Use Timing Light Breaker Points to Open Standard Head: 5° B.T.D.C. Plus 0°, Minus 1½°

Set Valves Intake .007" Exhaust .010"

Correct Float Level (Remove Cork Gasket) 5/32"

Idle Adjustment Screw Setting ½ to 1½ Turns Open

BRIEF CARBURETER ADJUSTMENTS

PUMP ADJUSTMENT: With the pump connector link in place, inner hole short stroke and throttle adjustment screw backed out, pump plunger should travel 14/64" from closed to wide open throttle position.
Pump travel should be measured by placing gauge T109-117S on rim of bowl cover around plunger shaft, and measure to top surface of connector link where it extends through plunger shaft. Reading should be taken at closed and wide open throttle position. Difference in reading should be "14." Adjustment can be made by bending throttle connector rod at lower angle until correct pump plunger travel is obtained.
METERING ROD ADJUSTMENT: Must be made when reassembling the carbureter or when leaner than standard metering rods are installed. Do not disturb **pump adjustment.** Procedure is as follows·

(A) Back out throttle lever adjustment screw until throttle valves seat. Insert one metering rod gauge T109-113 in place of metering rod Be sure gauge seats in jet

(B) Install metering rod pin and pin spring, in vacuum piston and link assembly

(C) Press lightly on top of vacuum piston until lip contacts tongue on anti-percolator arm There should now be less than .005" clearance between metering rod pin and shoulder in notch of gauge with the valves seated.

Adjust by bending tongue on pump arm. Remove gauge and metering rod pin and install metering rods, discs, spring, pin and pin spring, and hook spring to metering rods. Vacuum piston and link must not bind or drag in any position.

ANTI-PERCOLATOR ADJUSTMENT: Should be made after pump and metering rod adjustments Back out throttle lever adjusting screw so that throttle valves seat in bores of carbureter With throttle valve seated, insert .015" feeler gauge (T109-72) between anti-percolator stem and lips on anti-percolator arm Then bend lips so that center of indi-

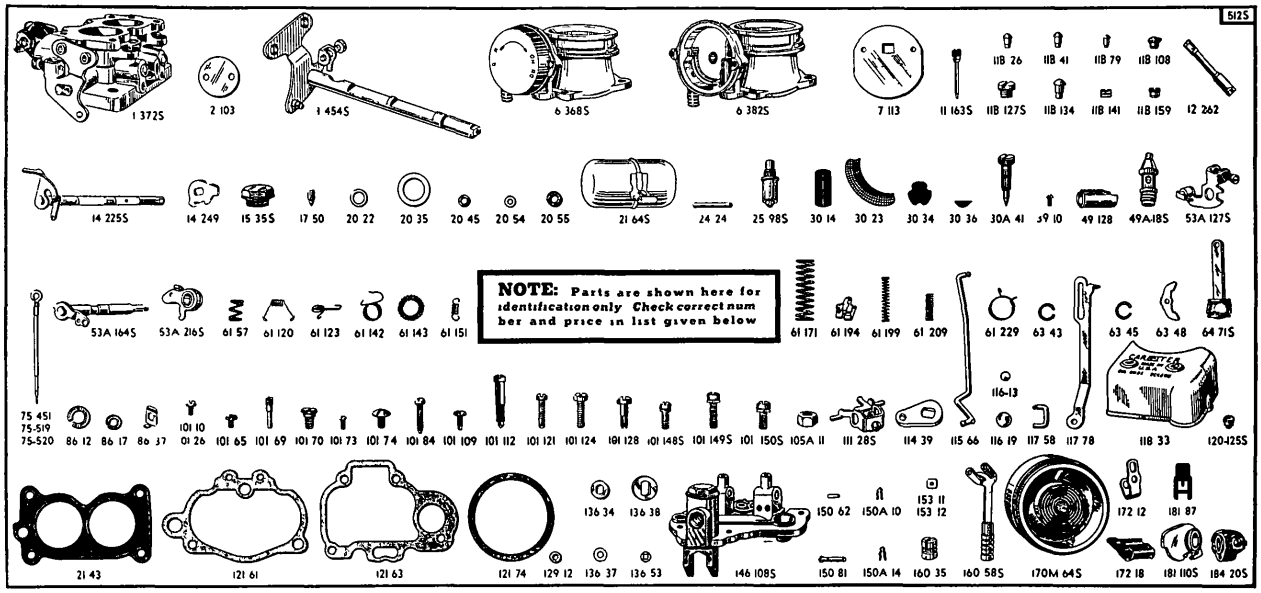
CARBURETER
TRADE MARK REG U. S PAT. OFF.
MARCA REGISTRADA



PRINTED IN U.S.A.

catoi lines are just flush with top of anti-percolator plug Care should be taken so there is an even adjustment made on both anti-percolator lips

UNLOADER ADJUSTMENT: With throttle wide open, distance between upper edge of choke valve and inner wall of air horn should be 11/64" (Use gauge T109-166) Adjustment can be made by bending lip on fast idle connector link With throttle wide open, push choke valve open Choke should lock within 5° of wide open position If it does not lock, recheck unloader adjustment Closing the throttle will release choke valve Choke trip lever is notched out for this setting

FAST IDLE ADJUSTMENT Hold choke valve tightly closed and adjust fast idle arm screw to give .020" opening between edge of throttle valve and bore of carbureter, side opposite port (Use gauge T109-29)

STARTER SWITCH Adjustment should be made with Carter tool No T109-155S, obtainable from your Carter distributor with complete instructions Switch must make contact between 30° and 45° throttle opening

Packard—1941-42-46-47—Carbureter No. 512S

WHEN SERVICING, USE GASKET ASSORTMENT No. 156, REPAIR PACKAGE No 1092A

PART NAMES IN CAPITAL LETTERS, LISTED BELOW, INDICATE CONTENTS OF REPAIR PACKAGE

Part No	PART NAME	
1-372S	Body flange and switch assembly	
2-103	Throttle valve	(2)
3-433S	Throttle shaft and lever assembly (Sup by 3-454S)	
3-454S	Throttle shaft and lever assembly	
6-368S	Air horn and Climatic® control assembly	
6-382S	Air horn and pump jet assembly	
7-113	Choke valve	
11-163S	LOW SPEED JET ASSEMBLY	(2)
11B-26	Body flange rivet plug	(2)
11B-41	Pump discharge rivet plug	(2)
11B-79	Rivet plug	(4)
11B-108	Idle port rivet plug	(2)
11B-126	Nozzle passage plug (Sup by 11B-127S)	(2)
11B-127S	Nozzle passage plug assembly	(2)
11B-134	Rivet plug	(2)
11B-141	Nozzle retainer plug	(2)
11B-159	BY-PASS BLEEDER SCREW PLUG	(2)
12-262	Nozzle	(2)
14-225S	Choke piston lever, link and shaft assembly	
14-249	Choke trip lever	
15-35S	Strainer nut assembly	
17-50	PUMP CHECK NEEDLE	
20-22	Needle seat gasket

Model SS-3952

(2 Cycle AV Engine)

HORIZONTAL, MODEL N TYPE, **CARBURETERS Nos. N-2056S, N-2450S**

CARBURETER SPECIFICATIONS

For Pincor One Cylinder, Two Cycle Engine 2 Inch Bore 1⅝ Inch Stroke

Dimensions Flange size ½ inch S A E Main venturi size 7/16 inch

Float Level Distance from top of float (at free end) opposite needle seat to outer edge of float chamber cover when needle is seated to be (N 2056S) 11/64 inch (gauge T109-166) (N 2450S) 13/64 inch (gauge T109 39) plus or minus 1/32 inch

Vent Inside none Outside size No 50 (070 inch) drill

Gasoline Intake Size No 48 (076 inch) drill

Low Speed Jet Tube Jet size No 75 (021 inch) drill Auxil iary jets (Idle Bleed) in side of tube 4—size No 70 (028 inch) drill

Idle Port Round type size 027 to 030 inch diameter

Idle Port Opening Top of port to be 006 to 010 inch above top edge of valve with valve tightly closed

Idle Screw Seat Size 051 inch diameter

Set Idle Adjustment Screw 1¼ to 2¾ turns open For richer mixture turn screw out Do not idle engine below 1600 r p m

Main Nozzle (N 2056S) Accelerating jets (in side of nozzle), 4—size No 55 (052 inch) dr ll (N 2450S) Instal'ed permanent'y DO NOT REMOVE Nozzle passage (nozzle well to a r horn) size No 32 (116 nch) drill

High Speed Adjusting Needle Seat (in base of nozzle) size 040 inch diameter Setting see adjustments

Choke Manual—butterfly type with poppet valve

Spark Plug Gap	Breaker Point Setting	Ignition Timing Breaker Points to Open	Float Setting	High Speed Adj Screw Setting	Idle Adjustment Screw Setting
025"	023" 025"	28° B T D C	11/64" (Plus or Minus 1/64")	¾ to 2¼ Turns Open	1¼ to 2¾ Turns Open

SERVICE PROCEDURE

To Disassemble

1 Remove carbureter from engine

2 Remove bowl nut gasket and bowl

3 Remove float pin float needle and needle seat Check float for dents leaks and wear on float lip or in float pin holes

4 Remove bowl ring gasket

5 Remove low speed jet and high speed adjusting needle as sembly and spring

6 Remove idle adjustment screw and spring

7 (N 2056S) Remove nozzle (N 2450S) nozzle installed permanently DO NOT REMOVE

8 Remove throttle valve screws valve and shaft and lever assembly

9 Do not remove choke valve and shaft unless replacement of these parts is necessary A spring loaded ball retains choke in wide open position Be sure to use a new ball and spring when replacing choke shaft and lever assembly CAUTION Hold a screw driver handle or a small piece of wood over threaded hole in air horn (side opposite choke lever) to prevent the ball from flying out when shaft is removed

10 Clean all parts in clean solvent making sure all carbon accumulation is removed from bore especially where throt tle valve seats in casting Blow out all passages with com pressed air Replace all worn and damaged parts Always use new gaskets

To Assemble
